INTRODUCTION TO VOLUME I.

THE complete preface to a book naturally cannot be written till the work itself is finished ; but with the first volume some remarks by way of introduction will be useful, to explain the object for which this work has been written, and the method on which it is arranged.

The primary object of the *Dictionary of Political Economy* is to provide the student with such assistance as may enable him to understand the position of economic thought at the present time, and to pursue such branches of inquiry as may be necessary for that end.

The table of the contents of the work shows how large is the range of investigation which the student must follow at the present time.

During recent years the course of economic study has extended so widely that it was obviously impossible to restrict the work to the old and formerly well-recognised boundaries. The development of the historical school has opened out new and fertile fields, while the wants of those who follow the mathematical method of study have also to be considered. These two main lines of treatment are here but mentioned as examples. They are far from exhausting the countless ramifications of inquiry now rightly thought necessary for the complete investigation of a study bounded only by the requirements of human life in every social relation.

In making the selection necessitated by the limits of space, the requirements of different classes of students have throughout been borne in mind. On the one side purely business matters, such as banking, the foreign exchanges, and the operations of the mint come in ; on the other, subjects of a philosophical character have been dealt with, such as questions of ethics and methods of definition, analysis, and reasoning ;—and the ways in which diagrams and mathematical processes may lend assistance to economic inquiry have also been discussed. Again, those interested in historical studies require an explanation of words found in early works, and those derived from classical and mediæval times ; also of legal phrases, now archaic, together with the modern correlative terms, for only thus can it be understood how ancient usage has influenced present habit. Life in the present day, even in the most modern settlements in the United States, in our Australian colonies, in the new countries coming into existence in different parts

of the world, is influenced largely by the past. The stream of existence, if the simile may be permitted, reaches us deeply coloured by the soil of the fields through which it has flowed, by the varied strata of the cliffs—some of them undermined by it—that have bounded its long and devious course.

Considerations of space have necessarily confined the scope of the work mainly to the developments of economic study in England, the United States, and our English-speaking colonies—and, in regard to these, an endeavour has been made to present under all the subjects treated an account of the best and most recent authorities; whilst the opinions held in other countries have also, as far as the required limits allowed, been considered and mentioned.

The biographies introduced have been selected with the same end. They show what has actually been written in former times, and hence will enable the reader to trace the progress of economic thought. Much attention has been given to the less-known writers. It is difficult for the student under ordinary circumstances to trace out when such authors lived, the surroundings which influenced their lives, and the opinions they held. While the oversights in science are sometimes as remarkable as the discoveries, these earlier labourers have not unfrequently been the precursors of other and better-known men, and have sometimes anticipated opinions that have held sway for long periods after them.

The different economic schools in the principal countries of the world are also described. Thus this volume contains notices of the American, Austrian, Dutch and English schools, and the French, German, Italian, and Spanish schools will follow in due course.

A work extending over so wide a range of subjects is, necessarily, the production of many minds, of writers whose pursuits, occupations, and studies are very diverse and varied. I desire to record my warm thanks to the contributors to the book, which is, I think, in itself an almost unique example of economic co-operation. Where all have assisted so heartily, it is less easy to select individual names; but I wish to be allowed to express my special thanks to Professor Dunbar, Dr. Keynes, Professor Marshall, Professor Montague, Professor Nicholson, Signor M. Pantaleoni, Mr. L. R. Phelps, Mr. L. L. Price, Mr. E. Schuster, Professor H. Sidgwick, and General Walker for valuable assistance in different directions, and particularly to Dr. Bonar, Professor Edgeworth, Mr. Henry Higgs, and Mr. H. R. Tedder, who have kindly helped in the more arduous labour of the preparation of the work for the press.

This is but an act of justice, that readers may know to whom they are specially indebted.

R. H. INGLIS PALGRAVE.

BELTON, NEAR GREAT YARMOUTH,
Christmas 1893.

TABLE OF CONTENTS

The numbers immediately following the headings of the Articles are those of the pages on which the Articles will be found. BIOGRAPHIES in small capitals.

Abatement or Rebate, 1	AGAZZINI, M., 20	Angel, 40
ABBOT, C., Lord Colchester, 1	Agency, Law of, 21	Anna, 40
ABEILLE, L. P., 1	Agents of Production, 21	Annates, 40
Abolitionist, 1	Agio, 22	Annealing, 40
ABOUT, E., 2	Agiotage or Agio, 22	Annual Rent, Scotch, 40

THE great art therefore of political economy is, first to adapt the different operations of it to the spirit, manners, habits, and customs of the people ; and afterwards to model these circumstances so, as to be able to introduce a set of new and more useful institutions.

The principal object of this science is to secure a certain fund of subsistence for all the inhabitants, to obviate every circumstance which may render it precarious ; to provide everything necessary for supplying the wants of the society, and to employ the inhabitants (supposing them to be free men) in such a manner as naturally to create reciprocal relations and dependencies between them, so as to make their several interests lead them to supply one another with their reciprocal wants.—SIR JAMES STEUART, *Inquiry into the Principles of Political Economy*.

The more extended our research becomes, the more we find that knowledge is a thing of slow progression, that the very notions which appear to ourselves new have arisen, though perhaps in a very indirect manner, from successive modifications of traditional opinions. Each word we utter, each thought we think, has in it the vestiges, is in itself the impress, of antecedent words and thoughts.—SIR W. R. GROVE, *Correlation of Physical Forces*.

DICTIONARY OF POLITICAL ECONOMY

ABATEMENT—ABOLITIONIST

ABATEMENT or **REBATE**. A deduction, drawback, or decrease made. A proportionate reduction of a payment allowed for special reasons—*e.g.* for prompt payment. E. S.

ABBOT, CHARLES, afterwards Lord Colchester (born 1757, died 1829), entered parliament in 1795, and became chairman of Pitt's finance committee 1797. He carried in 1800 a bill for charging public paymasters with the payment of interest on sums in hand. He was also the initiator of the commission of inquiry into the public records in the same year. But perhaps his chief title to fame is his introduction, in 1800, of the motion for a complete census of Great Britain. In spite of some opposition the Population Act, as it was called, was duly passed, and its provisions carried into force in the next year (see **CENSUS**). As speaker (elected 1802) he gave his casting vote against Lord Melville in 1805. On his retirement from the House of Commons in 1817 he was made a peer, and received a pension of £4000 a year. He devoted his later years to foreign travel, and to the improvement of roads in the Scottish highlands. J. B.

ABEILLE, LOUIS PAUL (born 1719, died 1807), became secretary of the Agricultural Society of Brittany, established through GOURNAY's influence in 1757. He was an ardent physiocrat, and argued (1763) for free trade in corn, along with QUESNAY, MORELLET, and the elder MIRABEAU. Writing later on the same subject (1768) he fell into the fallacy that high corn prices make high wages. DUPONT speaks of his style as "cold and heavy" but "clear." He wrote occasionally in the *Journal d'Agriculture* of Paris, when Dupont became its editor in 1765; but he seems never to have been on very good terms with that economist. When he was chosen inspector-general of manufactures (1768) his ardour seems to have cooled down, and he is not to be reckoned among the few who upheld the physiocratic cause after Turgot's death in 1781. His writings include (besides the *Corps d'Observations* of the Breton Agricultural Society) the following:—

Lettre d'un négociant sur la nature du commerce des Grains, Paris, 1763.—*Réflexions sur la police des Grains en Angleterre et en France*, Paris, 1764.—*Effets d'un privilège exclusif sur les droits de propriété*, Paris, 1764.—*Principes sur la liberté du commerce des Grains*, Paris, 1768.—*Fautes qui ont influé sur la cherté des Grains en France et en Angleterre*, Paris, 1768.—*Mémoire présenté par la Société Royale d'Agriculture sur l'usage des domaines congéables*, Paris, 1791.—*Mémoire en faveur d'Argent*, the inventor of the "Argand" lamp, Geneva, 1785.—*Mémoire à consulter (on the subject of the French East India Company)*, Paris, 1768.—[See Scholle's *Dupont de Nemours et l'école Physiocratique* (1888) *passim*, Daire's *Physiocrates*, 1846 (*e.g.* p. 38).] S. B.

ABOLITIONIST. A term applied especially to the social reformers headed by Thomas CLARKSON, who advocated and carried the abolition of the slave-trade in the British dominions, and applied generally to all who have aimed at abolishing either the trade in slaves or the institution of SLAVERY, whether in the British dominions or elsewhere.

The causes which contributed to abolition in the first sense are arranged by Clarkson (*q.v.*), the historian of the movement, in four divisions, quaintly illustrated by four confluent streams (*History of the Abolition of Slave-Trade*, 1808, p. 259). The four classes of abolitionists may be summarily described as (1) miscellaneous, mostly literary (Pope, Thomson, etc.); (2) Quakers in England; (3) Quakers in America; (4) Clarkson himself, with his fellow-workers. In 1787 the first committee for the abolition of this trade was formed by Clarkson and his associates. At first their efforts were devoted to the abolition only of the trade in slaves, as the abolition of slavery itself seemed hopeless. In 1789 Wilberforce introduced a measure into parliament, founded upon Clarkson's materials, but it was not till 1807 that the bill for the abolition of the slave-trade passed the House of Commons, and not till 1833 that British colonial slavery was abolished by act of parliament. The abolition of slavery in the British dominions gave prominence to two points of economic interest—the inefficiency

of slave labour, and the right to compensation in case of expropriation, even when the kind of property has received the most severe public moral condemnation.

The movement towards liberty, initiated by England, has been continued by most of the continental nations at varying rates down to the present time. Denmark, indeed, has the honour of anticipating the action of England. In 1792 it was ordered that slave-trade should cease in Danish dominions after 1802. In the United States the movement in favour of abolition is coeval with the union. Before the end of last century, or early in the beginning of the present one, slavery was abolished in many of the original states. The admission of new states has more than once raised the question, within what limits should slavery be tolerated? Thus, on the admission of Missouri, the boundaries within which slavery was permitted or prohibited were carefully defined by the "Missouri compromise" (1820). That arrangement was at a later period (in the case of Dred Scott, 1856-57) interpreted unfavourably to the cause of abolition. The indignation of abolitionists was roused by the cruel administration of the fugitive slave law and other iniquities. Slavery was a cause, and abolition a result, of the Civil War 1861-65.

The economic questions connected with American slavery have been well treated by CAIRNES in his work on the *Slave Power* (see SLAVERY). See also, with reference to America, H. GREELEY, *The American Conflict*, 1865. Clarkson published in 1808 a *History of the Abolition of the Slave-Trade* (2 vols.)

J. S. S.

ABOUT, EDMOND (member of the *Académie Française*), born at Dieuze (Lorraine), 1828, died at Paris, 1885. It was especially as a novelist that About made his reputation, and it is to be regretted that politics, after 1871, reduced this inimitable romance writer, who had produced such works as the *Roi des Montagnes* and the *Mariages de Paris*, to the position of a mere editor of a journal (the *XIX. Siècle*). The works which should be noticed in this place were written between the purely literary period and the more militant period of About's animated life. In *Maitre Pierre* (1858) and the *Lettres d'un bon jeune homme* (1860) About, as a passionate admirer of the wonders of human industry, and the conscientious defender of the principles of *laissez faire laissez passer*, still writes as a novelist and a storyteller. But genuine didactic works followed. We may cite *le Progrès* (1864) and *l'A B C du travailleur* (1868), *l'Assurance* (1865) and *le Capital pour tous* (1869). In these last-named works the author limits himself to setting forth the principles which others had formulated before him, while he denounces certain errors of interpretation. Though About may be described

as only a *populariser*, he yet deserves consideration from the students of economic science, to which, for ten years, he devoted all the resources of his humour, imagination, and incomparable style.

A. DE F.

ABRASION. The abrasion or loss by wear and tear of the coins in use is an important factor in the cost of a metallic circulation. This differs between one country and another according to the hardness of the coin which results from the description of ALLOY employed, to the surface of the coin exposed to wear in proportion to its bulk, to the greater or less employment of coin in circulation. At the present time the wear of the principal gold coin of the British empire (SOVEREIGN) is very considerable. The investigation set on foot by JEVONS in 1868 shows that the sovereign in ordinary use loses on an average .043 of a grain annually. In other words, the wear and tear of an English sovereign appears to be at the rate of $\frac{1}{23000}$ parts, or something less than one-tenth of a penny per annum (J. B. Martin, "Media of Exchange," *Journal of Statistical Society*, 1884, p. 489). The standard weight is 123.274 grains, and the lowest weight of legal currency 122.5 grains, so that the sovereign loses the .774 grains, which reduces it below legal tender, on an average in about 15.7 years. In the case of the HALF-SOVEREIGN, the difference between standard weight and the lowest current weight is .512 grains; and as the yearly loss of the half-sovereign averages .069 grains, these coins are reduced below legal tender weight generally in the short period of seven and a half years. The wear of the English coinage cannot, however, be taken as the criterion of the wear of all coinages everywhere, as varying rapidity of circulation, use of small paper representatives of money, etc., cause great differences between one country and another. The estimates of the actual amount differ very greatly from each other; one made by JACOB, which includes the wear both of gold and silver coins, is of "one part in three hundred and sixty annually" (Jacob on the *Precious Metals*, vol. ii. p. 186).

[For detailed information see *An Historical Inquiry into the Production and Consumption of the Precious Metals*, W. Jacob, London, 1831 (2 vols.)— "Paper on the Condition of the Gold Coinage of the United Kingdom," W. S. Jevons, *Journal of the Statistical Society of London*, reprinted with much similar information in Jevons's *Investigations in Currency and Finance*.—See also paper by John B. Martin, "Our Gold Coinage," *Journal of the Institute of Bankers*, June 1882.—Paper by R. H. Inglis Palgrave, "The Deficiency in Weight of our Gold Coinage, with a Proposal for its Reform," March 1883; "The Gold Coinage," December 1884 (both in *Journal, Institute of Bankers*).—*Reports of Deputy Master of Mint*, particularly those for 1883, 1884, 1885, and *passim*,—and *Evidence and Reports Royal Commission on Recent Changes in the Relative Values of the Precious Metals*, which

ABROAD. See JURISDICTION.

ABSENTEE. An absentee may be variously defined (1) as a landed proprietor who resides away from his estate, or (2) from his country; or more generally (3) any unproductive consumer who lives out of the country from which he derives his income.

Examples of these species are (1) a seigneur under the *ancien régime* living in Paris at a distance from his estates; (2) an Irish landlord resident abroad; (3) an Anglo-Indian ex-official resident in England and drawing a pension from India. In writing briefly on the evils of absenteeism it is difficult to use general terms appropriate to all the definitions; but considerations primarily relating to some one definition may easily be adapted to another by the reader.

It is useful to consider separately the effects of the absentee proprietor's consumption upon the wealth of his countrymen; and the moral, as well as economical effects of other circumstances.

I. The more abstract question turns upon the fact that the income of an absentee is mostly remitted by means of exports. "The tribute, subsidy, or remittance is always in goods . . . unless the country possesses mines of the precious metals" (Mill). So far as the proprietor, if resident at home, would consume foreign produce, his absence, not increasing exports, does not affect local industry. So far as the proprietor's absence causes manufactures to be exported, his countrymen are not prejudiced. For they may have as profitable employment in manufacturing those exports as, if the proprietor had resided at home, they would have had in supplying manufactured commodities or services for his use. But if the proprietor by his absence causes raw materials to be exported, while if present he would have used native manufactures and services, his absence tends to deprive his countrymen of employment, to diminish their prosperity, and perhaps their numbers. This reasoning is based on SENIOR's *Lectures on the Rate of Wages* (Lecture II.), and *Political Economy* (pp. 155-161). Senior's position is in a just mean between two extremes,—the popular fallacy and the paradox of M'CULLOCH. On the one hand it is asserted that between the payment of a debt to an absentee and a resident there is the same difference as between the payment and non-payment of a tribute to a foreign country. On the other hand it is denied that there is any difference at all. The grosser form of the vulgar error, the conception that the income of the absentee is drawn from the tributary country in specie,

is exemplified in Thomas PRIOR's *List of Absentees* (1829). M'Culloch's arguments are stated in the essay on "Absenteeism" in his *Treatises and Essays on Money*, etc., and in the evidence given by him before some of the parliamentary commissions which are referred to below. Asked "Do you see any difference between raw produce and manufactured goods," M'Culloch replies, "I do not think it makes any difference" (compare *Treatises and Essays*, p. 232). He appeals to observation, and finds that the tenants of absentee landlords are "subjected to less fleecing and extortion than those of residents."

J. S. MILL attributes to absenteeism a tendency to lower the level of prices in the country from which the absentee draws an income; with the consequence that the inhabitants of that country obtain their imports at an increased cost of effort and sacrifice (*Unsettled Questions*, essay i. p. 13). Mill's meaning may be made clearer by a study of the rest of the essay which has been cited, and of the parallel passage in his *Political Economy* (bk. v. ch. iv. § 6), where he argues that an inequality between exports and imports results in an "efflux of money" from one country to another.

Upon less distinct grounds QUÉNEY connects absenteeism with a development of trade and industry in an unhealthy direction (*Œuvres*, ed. Oncken, p. 189). Among second-rate considerations which may bear on the subject should be mentioned CASTILLO's theory concerning the effect of the consumption of the rich on the growth of population (*Œuvres*, pt. i. ch. vii.).

II. Other economical advantages lost by absenteeism are those which spring from the interest which a resident is apt to take in the things and persons about him. Thus he may be prompted to invest capital in local improvements, or to act as an employer of workmen. "It is not the simple amount of the rental being remitted to another country," says ARTHUR YOUNG, "but the damp on all sorts of improvements." D'ARGENSON in his *Considérations sur le gouvernement ancien et présent de la France* (1765, p. 183), attributes great importance to the master's eye.

The good feeling which is apt to grow up between a resident landlord and his tenantry has material as well as moral results, which are generally beneficial. The absentee is less likely to take account of circumstances (e.g. tenant's improvements), which render rack-renting unjust. He is less likely to make allowance for calamities which render punctual payment difficult. "Miseries of which he can see nothing, and probably hear as little of, can make no impression," A. YOUNG. He is glad to get rid of responsibility by dealing with a "middleman," or intermediate tenant—an additional wheel in the machinery of exaction, calculated to grind relentlessly those placed underneath it. Without the softening influence

of personal communication between the owner and the cultivator of the soil, the "cash nexus" is liable to be strained beyond the limit of human patience, and to burst violently. There can be little doubt but that absenteeism has been one potent cause of the misery and disturbances in Ireland. The same cause has produced like effects in cases widely different in other respects. The cruellest oppressors of the French peasantry before the Revolution were the *fermiers*, who purchased for an annual sum the right to collect the dues of absentee seigneurs. The violence of the GRANGER Railway legislation in the western states of America is attributed to the fact that the shareholders damaged were absentee proprietors (Seligman, *Journal of Political Science*, 1888).

There are also the moral advantages due to the influence and example of a cultivated upper class. The extent of this benefit will vary according to the character of the proprietors and the people. In some cases it may be, as ADAM SMITH says, that "the inhabitants of a large village, after having made considerable progress in manufactures, have become idle in consequence of a great lord having taken up his residence in their neighbourhood." The opposite view, presented by Miss EDGEWORTH in her *Absentee*, may be true in other states of civilisation. Perhaps the safest generalisation is that made by SENIOR that "in general the presence of men of large fortune is morally detrimental, and that of men of moderate fortune morally beneficial, to their immediate neighbourhood."

[The references cited below are to be added to those which have been already made. They fall under two heads: (a) the unfortunately large class relating specially to Ireland, and (b) Miscellaneous. (a) The Act 3 Richard II. and 28 Henry VIII., inflicting on absentees forfeiture of two-thirds of the yearly profits from their lands. These and other acts relating to absentees are cited in *Tracts and Treatises Illustrative of . . . Ireland* (reprinted by Thom), 1840. F. Y. E.

ABSTINENCE. This well-chosen expression of SENIOR's, to use J. S. MILL's well-known description, has been unfortunate in giving rise to much controversy. It was intended to refer to that element in profits which might be considered as the "natural" reward of the capitalist for abstaining from immediate consumption. It was thus closely connected with the effective desire of accumulation and the theory of a "minimum rate of profits." It has also been much used in the establishment of economic harmonies in the style of BASTIAT with the view of showing that "natural" economic laws are in fundamental accord with "common-sense" morality. As might have been expected from the ambiguity of the terms "natural" and "common-sense," and from the vagueness of the conception abstinence itself, this economic harmony has been severely criticised in the first place by the

Socialists (e.g. LASSALLE in *Schulze-Delitsch*, KARL MARX in *Das Capital*). It was easy to point out that the virtue of abstinence could in many cases be reduced merely to desire for money as such and to a positive reluctance to spend. This criticism does not, however, seem capable of general extension. More recently another line of criticism has been developed and attention has been drawn to the positive effort required to convert wealth into capital for use in production corresponding in the main to the management or superintendence required after the capital has been formed (compare BAGEHOT, *Economic Studies*, and Schönberg's *Handbuch*, art. "Capital"). (See CAPITAL.) J. S. N.

ABSTRACT OF TITLE. An epitome of the evidence of ownership showing the soundness of one's right to an estate. In the absence of any agreement to the contrary the purchaser of a freehold estate is entitled to have such evidence for a period of forty years, but in the case of advowsons the period is one hundred years. The abstract is sufficient if it shows that the vendor is either himself competent to convey or can otherwise procure to be vested in the purchaser the legal and equitable estates free from incumbrances. [Dart's *Vendors and Purchasers*, London, 1888.] J. E. C. M.

ABSTRACT POLITICAL ECONOMY. Political economy is sometimes described as a wholly abstract science, dealing with an unreal and imaginary subject, that is to say, not with the entire real man as we know him in fact, but with a simpler being who is supposed to be engrossed with one desire only, namely, the desire of wealth. Thus, according to the doctrine laid down by J. S. MILL in his *Unsettled Questions of Political Economy*, the science makes entire abstraction of every human passion and motive, other than the pursuit of wealth, and the perpetually antagonising principles to that pursuit, namely, aversion to labour, and desire of the present enjoyment of costly indulgences. In other words, the economist is described as always working on the hypothesis that the acquisition of wealth is the sole end and aim of human action. In opposition to this view is that of the so-called "realistic" school, some of whom practically deny the utility of any abstract or hypothetical treatment of political economy at all. It is maintained by COMTE and others that any attempt to separate economic science from social philosophy in general must necessarily end in failure. The truth seems to lie between these two extreme doctrines; and it may be pointed out that writers who, like Mill and BAGEHOT, describe political economy as in its complete form a purely abstract science, nevertheless do not treat it as such in their own writings. It is true that they employ an abstract method in many of their reasonings, but it is also true that, taking their doctrines as a whole, they do not hold themselves

aloof from the concrete realities of actual life to anything like the extent that their description of the science would lead one to anticipate. They begin with abstractions, but do not end with them; and herein is the true method of the science roughly set forth. We ought accordingly to recognise two stages in economic doctrine, which may be called the abstract and the concrete stage respectively. It may not be possible to draw a hard and fast line between the two, but this does not destroy the value of the distinction. Abstract political economy concerns itself entirely with certain broad general principles, irrespective of particular economic conditions; or, as JEVONS puts it, with "those general laws which are so simple in nature, and so deeply grounded in the constitution of man and the outer world, that they remain the same throughout all those ages which are within our consideration" (*Fortnightly Review*, Nov. 1876, p. 626). It may thus be of universal validity, but this is after all only in virtue of its hypothetical character. It may remain remote from the actual concrete facts. Concrete political economy comes in, therefore, as a supplement. It takes account of special conditions that the pure theory avowedly neglects, and especially concerns itself with the qualifications and limitations, with which the abstract doctrines need to be interpreted. It puts forth no claim to universality, but is content if it can interpret and explain the actual economic phenomena, characteristic of a given period or a given state of society.

[Compare Mill, *Unsettled Questions of Political Economy*, Essay v.; —Bagehot, *Economic Studies*, Essays i. ii.; —Jevons, *The Future of Political Economy*; —*Fortnightly Review*, Nov. 1876; —Keynes, *Scope and Method of Political Economy*, ch. iv., note A.] J. S. N.

ABUNDANCE. In economical, as in popular, discussions, abundance is usually the correlative of scarcity and the synonym of plenty. If there is a distinction plenty is taken to mean a sufficient, and abundance a more than sufficient, provision for wants. Abundance taken absolutely, in the sense of an overflowing plenty, of all and every sort of goods is certainly one ultimate aim of economic effort; and BASTIAT in the cause of free trade has done good service by his assertion and illustration of this axiom. As an overflowing plenty it implies the possibility of leisure; it is a provision secured without cost of labour. Though this is an unrealisable ideal, the economical progress of any society may nevertheless be measured by its approximation to it. In the introduction to the *Wealth of Nations* "the abundance or scantiness of the annual supply of the necessities and conveniences of life" is made synonymous with wealth and poverty. In ordinary language, however, abundance does not, like wealth or riches, suggest a contrast of more fortunate with

less fortunate men, but rather a relation of the wants of individual men to their means of satisfaction, without any idea of contrast with their neighbours.

Taken in a narrower sense, abundance, not of all and sundry, but of particular classes of goods, is less clearly a benefit than general abundance. To the seller, abundance (which lowers the value of his wares) is an evil. The paradox of QUESNAY and other physiocrats, "Disette et cherté est misère; abundance et cherté est opulence" (*e.g.* Daire's *Physiocrates*, p. 98, cf. 391 ft.), meant, for example, that the agriculturist could only prosper if he had a good market for his crops as well as a large harvest of them. It is bad policy, they said, to create an abundance of necessities in preference to an abundance of other goods, damaging one class of producers in order to benefit the rest. So it is a fact of common experience that abundance, when confined to one kind of goods, means an "over-production" or "glut" of them. The remedy (as Say pointed out) is not to decrease the abundance of the one kind but to increase the abundance of the others, and so bring the community nearer its ideal of general abundance (see also GLUT; OVER-PRODUCTION; PHYSIOCRATS; J. B. SAY; VALUE; and WEALTH). J. B.

ACCEPTANCE. In relation to contracts generally, the term "acceptance" means the signification of assent by one person to a proposal made by another.

In relation to contracts of sale the term has two significations which must be distinguished. There is an acceptance in performance of the contract when the buyer intimates to the seller that he has accepted the goods, or when he does any act in relation to them inconsistent with the ownership of the seller; but for the purposes of the 17th section of the Statute of Frauds, it is sufficient if he does any act which recognises a pre-existing contract of sale, even though he may not be precluded from afterwards rejecting the goods (see SALE).

In relation to bills of exchange the term primarily means the acceptance by the drawee of a bill of exchange duly written thereon and signed; but as the main object of the drawer of a bill is to get it accepted, the term "acceptance" is frequently used to denote the bill itself, and is then synonymous with "bill of exchange" (see BILL OF EXCHANGE).

M. D. C.

ACCEPTILATION (Scots and civil law). Extinction of a debt by discharge granted gratuitously or for trifling payment. A. D.

ACCEPTOR. The person on whom a bill of exchange is drawn, namely, the drawee, becomes the acceptor by signifying his assent to the document in writing (see BILL OF EXCHANGE). The validity of an acceptance sometimes turns on very intricate points of law.

For details on this, see *The Practice of Banking*, by John Hutchison, especially vols. i. and iii.

ACCESSIO. A term of Roman law used to express the acquisition of property by an addition to former property, due to an accidental circumstance. If, for instance, a plot of land on the bank of a river was increased by the gradual deposit of earth on the bank, the property in the new piece of land was said to be acquired by "accessio." E. S.

ACCESSION, DEED OF. See BANKRUPTCY IN SCOTLAND.

ACCOMMODATION BILL. An accommodation bill may be described as a bill given without receipt of value, in order that the person to whom it is given may raise money and obtain credit by means of it. Ordinarily, the person who lends his name accepts a bill drawn on him by the person he wishes to accommodate, but sometimes a bill is drawn, accepted, and indorsed by different persons, in order to accommodate some person who is not a party to the bill at all. Perhaps the strict legal definition of an accommodation bill would be a bill whereon the principal debtor, according to the terms of the instrument, is in substance a mere surety for some other person, whether that person be a party to the bill or not. When an accommodation bill gets into the hands of a holder for value he may enforce payment of it precisely in the same way as if the bill had been given for value. When, however, an accommodation bill is dishonoured, some special considerations come into play. In the first place a drawer or indorser for whose accommodation the bill was accepted cannot set up as a defence either absence of notice of dishonour or informality in presentment for payment, for he was the party primarily liable to meet the bill. Secondly, if the bill be held by a person who knows the real relationship of the parties, the ordinary rule of the law of principal and surety then attaches, and a discharge of, or binding agreement to give time to, the principal debtor may discharge the surety. For instance, suppose the holder of a bill knows that it was accepted to accommodate the drawer. If it is dishonoured, he may sue either the acceptor or the drawer, or both; but if, for some fresh consideration, he agrees with the drawer not to press him for (say) three months, he thereby discharges the acceptor. So if a joint and several note is made by three persons, two of whom sign to accommodate the third, and the holder accepts a non-statutory composition from such third person, the two co-makers who signed to accommodate him would ordinarily be discharged. M. D. C.

ACCOUNT. On the stock exchange there are settlements, bi-monthly in general securities, and monthly in British consols and India Government sterling stocks. The account begins after one settlement and ends at the date of the

next. Transactions are said to be "for the account," and prices are quoted for the account, to distinguish these transactions from bargains done "for cash," meaning for ready money. Practically, all the speculation that goes on in the stock exchange is done by buying or selling "for the account" (see CARRYING-OVER; BACKWARDATION). A. E.

ACCOUNT DUTY. See DEATH DUTIES.

ACCOUNTS, MERCHANTS'. See PRESCRIPTION, SCOTCH.

ACCRETION (Scots law term). Referring back an after-acquired title so as to complete a right originally defective or imperfect. A. D.

ACCRUE. To arise or spring as a natural growth or result. Accrued interest is the interest due for the period which, at a given moment, has elapsed since the last payment of interest, as for the time being it increases the principal debt. The word is not always free from ambiguity; if, for instance, property accruing after a certain date is spoken of, it is not quite clear whether property in which a future interest was acquired before the period named, but which only came into possession afterwards, is included. E. S.

ACCUMULATION. Without entering into the difficulties involved in the definitions of CAPITAL; WEALTH (*q.v.*), and simply assuming that accumulation refers to wealth set aside from present consumption for future uses, the rate of accumulation in any country at any time is held to depend upon two groups of causes: (I.) causes affecting the fund from which savings can be made; (II.) causes which induce people to save rather than to consume their wealth.

Under the *first* group of causes may be enumerated—(1) natural resources, *e.g.* minerals, climate, harbours, rivers, etc.; (2) efficiency of labour and capital, including industrial skill and organisation (see EFFICIENCY OF LABOUR); (3) the amount taken by government for public purposes either directly by taxation or indirectly by exacting services, as in conscription for military purposes. The indirect effects and methods of expending it must always be taken into account (see TAXATION); (4) foreign trade, under which we must take into account the various elements of international indebtedness (see FOREIGN EXCHANGES), *e.g.* earnings for freight and returns on foreign investments; (5) credit, which indirectly and directly saves both labour and capital. Division of labour in the modern sense would hardly be possible without credit, and it is largely owing to credit that saving in the economic sense has taken the place of hoarding (see CREDIT); (6) means of communication, *e.g.* roads, canals, and railways, play an important part in the production of wealth, for the act of production is not complete till the commodity is in the hands of the consumer. To summarise in a sentence, the amount of the fund from which savings can be made

depends upon the efficiency of the three great agents of production—natural agents, labour, and capital, as compared with the total expenses of all kinds, both of individuals and governments, which are necessary to preserve what is called the STATIONARY STATE (*q.v.*)

Secondly we must consider the motives which induce people to save rather than to consume this real net produce. The following are held to be the most important factors: (1) security that what is saved will be preserved to or enjoyed by the owner. Even slaves, out of their small *peculium* have been known to save if they were sure of their savings. Security, as MILL points out, must be given not only by the government but against the government (compare Turkey at present or the old Roman provinces). Security of life owing to climatic or other natural causes may also be mentioned; (2) effective desire of accumulation; this consists really of a group of motives. It may be weak from intellectual deficiency, mere want of power to look forward (compare American Indians and Chinese), or from moral deficiency, no interest in others, no sufficient care to avoid pauperism in old age, or to provide for a family, etc.; (3) desire to rise in the social scale—the importance attached to the mere possession of wealth apart from its uses—a point too often overlooked; (4) facilities for investment; this is specially illustrated by the case of labourers and savings facilitated by growth of savings banks, building societies, etc., and by insurance companies for all classes; (5) the difference of the classes among which the national wealth is distributed, as certain classes tend to save more than others (compare France before and after the Revolution, the waste of the aristocracy and the saving of the peasants); (6) the rate of interest, which operates in two ways. If the return is high there is a greater *inducement* to invest, though ADAM SMITH, in speaking of the high profits of the monopoly of the colonial trade, thinks it tends to promote extravagance. If the return is low, however, there is need to save more to make a certain provision against old age, sickness, etc.

[The subject of accumulation is treated at length in all the principal text-books. Special attention, however, may be called to the criticism by JONES (*Political Economy*, edited by WHEWELL) of previous writers, and to the practical example in Sir R. Giffen's paper entitled "Recent Accumulation of Capital," *Essays in Finance*, 1878, and by the same author *The Growth of Capital*, 1889 (see CAPITAL).] J. S. N.

ACHENWALL, GOTTFRIED, economist and statistician, born in 1719 at Elbing in West Prussia, died in 1772 at Göttingen, where he was a professor in the university. He was author of *Staatsklugheit nach ihren ersten Grundsätzen*, 1761, a work in which, as ROSCHER remarks, description greatly preponderates over

criticism. He belongs to the same school as JUSTI, namely, that of the moderate mercantilists. It is in the history of statistics more than in connection with economics that he holds a really high place; the Germans indeed sometimes call him the Father of Statistics, strangely ignoring the claims of PETTY and other earlier writers. The work by which he is known in this department is his *Staatsverfassung der heutigen vornehmsten Europäischen Reiche*, 1752. There is prefixed to this treatise an introduction on statistics in general, in which he seeks to determine accurately the province of the study, and to distinguish it clearly from other kindred branches of research. In the body of the work he gives a view of the constitutions of the several states of Europe, and describes the condition of their agriculture, manufactures, and commerce, often supplying numerical details in relation to these subjects. He seems to have been the first to use the German word *Statistik*; the Latin adjective *Statisticus* is found in the title of a book by a German publicist, known as Helenus Politanus (*Microscopium Statisticum, quo status imperii Romano-Germanici repræsentatur*) published in 1672 (Roscher, *Gesch. der Nat. Oek. in Deutschland*, p. 466). J. K. I.

ACKERSDYK, JOHN, born at Bois-le-due, 20th Oct. 1790, studied law at Utrecht, and graduated there in 1810. He died 1861. First a lawyer, afterwards a judge, he was appointed in 1825 a professor at the University of Liège, and in 1830, after the Belgian revolution, a professor at Utrecht. Here from 1849 till 1860 he taught economics.

During his long and frequent travels Ackersdyk collected a vast mass of information which he availed himself of to enrich his lectures. His writings are not very numerous, being principally short essays in periodicals. The following are specially deserving of notice: *Bedenkingen over de Korenruetten* (Remarks on the Corn Laws), 1835;—*Nederlands financien—Nationale Schuld* (Financial condition of Holland—National debt), 1843;—*Nederlands Muntwezen* (The Dutch Currency), 1845;—*Over belastingen en Bezuinigingen* (On Taxes and Savings), 1849. A. F. V. L.

ACKNOWLEDGMENT. The formal admission of some fact—e.g. acknowledgement of indebtedness. The "acknowledgement of an account" in commercial language is equivalent to the "account stated" of legal language, which is an admission by one party who is in account with another that there is a balance due from him. Such an admission in our law imports a promise to pay upon request. "Acknowledgement of married women" is the technical expression for the particular method which must be adopted whenever a married woman alienates real property which is not included in her separate estate. The deed conveying the property must be *acknowledged* by the woman on being exa-

mined by a judge or commissioner apart from her husband. As the sphere of the separate estate has been considerably enlarged by the Married Women's Property Acts, the opportunities for adopting this procedure are less frequent. E. S.

ACLAND, REV. JOHN, born in 1699, was the second son of John Acland, M.P., of Woodly, Yorkshire. He graduated M.A. at Oxford (Exeter Coll.) in 1725, was instituted vicar of Broad Clyst, Devonshire, in 1753, and was led by the failure of friendly society legislation in that county to publish—*A Plan for rendering the Poor independent on Public Contribution founded on the basis of Friendly Societies commonly called Clubs, to which is added a letter from Dr. Price, Exeter, 1786*, 8vo. Acland's proposal was that Parliament should establish throughout England a general club for the poor in sickness, old age, or when out of work; to this every adult wage-earner should contribute as well as the general community (see INSURANCE, NATIONAL). This plan was criticised in a pamphlet (1788) by the Rev. John HOWLETT (q.v.) An abstract of it may be seen in EDEN's *State of the Poor*, i. 373-380. Acland also wrote *An Answer to a Pamphlet published by E. King, in which he attempts to Prove the Public Utility of the National Debt, and a True Statement of the Real Cause of the present high price of Provisions*, 1796, 8vo (a tractate on the evils of the National Debt). H. R. T.

ACQUITTANCE. (1) Release, discharge. (2) A receipt in full, which bars a further demand. E. S.

ACT OF BANKRUPTCY. For Scotch equivalent (Notour bankruptcy) see BANKRUPTCY IN SCOTLAND. A. D.

ACTOR SEQUITUR FORUM REI. See JURISDICTION.

ACTUARY. The officer of a life insurance company whose duty it is to advise upon all questions relating to their tariffs, rates of premium, and periodical valuations of assets and liabilities, in which the calculations are based upon mathematical science, the laws of probability, and the statistics of death and of survivorship, in combination with all the scientific formulæ connected with interest of money and with commercial finance. In this sense the designation defines a distinct class of professional men, and, as such, it has long been used in the legislative enactments relating to life assurances and annuities, and to friendly societies. In the year 1884 the united members of this profession received a charter of incorporation from the crown, empowering the existing members of two societies theretofore known as the Actuaries Club and the Institute of Actuaries to combine under specified regulations, by the title of that institute, and the present and future members to affix the

denoting letters of F.I.A. to their names. The *Journal of the Institute of Actuaries* is published quarterly, and its twenty-eighth volume has already been reached. The earlier volumes bore the title of *The Assurance Magazine*. Its contents may with confidence be recommended to students, as embracing papers of the highest importance in connection with the doctrine, history, and practice of life assurance, and vital and other statistics bearing thereon and upon annuities, marine and fire insurance. The designation of actuary has also been long applied to certain officers invested with duties, more or less like the above, in savings banks and in government offices such as those of the commissioners for the reduction of the national debt, the war office, etc. It has also been applied in the last two centuries to the clerk to the convocation of clergy, but the name is in this case derived from his being the recording officer of the acts arising out of the deliberations of that ancient body, in the same way that the "actuar," a functionary of the courts of justice in Germany, has to record and to see to the promulgation of their decrees. An account of the designation of *actuaries* in the case of public officers of other kinds in ancient Greece and Rome, may be read in Sir George Cornwall Lewis's *Methods of reasoning in matters of Politics* (see INSURANCE). F. H.

ACTUS. An expression of Roman law used to indicate the right of an adjoining owner to drive cattle and take carts over his neighbour's land. E. S.

ADAMS, CHARLES FRANCIS, born in Boston 1807; died 1886; was a lawyer and diplomatist, and during the civil war minister to England. In the period 1835-40 he gave considerable attention to the subject of currency, and differed from the Whig party's position. Adams wrote, in 1837, *Reflections upon the state of the currency in the United States*, Boston, pp. 34, also *Further reflections upon the state of the currency in the United States*, Boston, pp. 41. He asserted that the financial disturbance of 1837 was due to over-banking, and not to over-trading with foreign countries, and that it would be impossible to secure a uniform currency until it was taken in hand by the national government. Adams was opposed to the sub-treasury system, and favoured a national bank. He must not be confounded with his son, Charles Francis Adams the younger, the well-known writer on the railway question. D. R. D.

ADDISON, JOSEPH, born 1672, died 1719. Addison's brilliant literary career has drawn away general attention from his official position in the government of his time, and his occupation as one of the lords commissioners of trade (see BOARD OF TRADE). His remarks (No. 69 of the *Spectator*) on the importance of the traffic of the merchant in reference to the general

prosperity of the country may still be read with interest as embodying those facts on which the principles of free trade rest.

ADEMPMENT OF LEGACY occurs where a legacy does not take effect owing to some act on the part of a testator not affecting the validity of the will; (1) Where the testator alienates the subject matter during his lifetime the legacy fails; (2) Where a parent or a person *in loco parentis* gives a legacy to a child, and afterwards advances to such child a portion on marriage, or on preferment in life, if the portion be equal to or greater than the legacy, it operates as a total ademption of such legacy; if of lesser amount it adeems the legacy *pro tanto*.

[See Williams on *Executors*, 1879, pp. 1327-1345.] J. E. C. M.

ADJUSTMENT, AVERAGE. A Rhodian law provided that if, in order to save a vessel, a portion of the cargo was thrown overboard, the owners of the rest of the cargo should contribute to the loss. This principle has been followed by modern nations, and in the English law it has been expressed in the following terms:—"All loss which arises in consequence of extraordinary sacrifices made or expenses incurred for the preservation of the ship and cargo comes within general average, and must be borne proportionally by all who are interested" (LOWNDEN on *General Average*, 4th ed., London, 1888, p. 21). The calculation of the losses incurred and the adjustment of the amount to be contributed by the ship, the cargo, and the freight respectively, is effected by a class of arbitrators called "average adjusters," whose duty it is to give their decision in accordance with legal principles. In computing the amount to be made good the following are the chief rules. (1) Disbursements are estimated at the amount expended *plus* the costs of raising funds. (2) Cargo sacrificed is valued at such a sum as would place the owner in the same position at the time and place of adjustment as if not his goods but those of some other person had been sacrificed. (3) Ship's materials sacrificed are valued at the cost of repair, less a deduction of one-third in respect of the advantage derived by the owner from the fresh repairs.

To the amount of loss so ascertained contribution has to be made (1) by the ship in proportion to its actual value to the owner at the time of adjustment; (2) by the cargo in proportion to its net market value at the date of delivery or at the time and place of adjustment, deducting the expenses the merchant incurs in case of delivery; (3) by the freight less the expense of earning it which would have been saved had the ship been lost (see AVERAGE, MARITIME).

[*The Law of General Average, English and Foreign*, by Richard Lowndes, 4th ed., London, 1888.] J. E. C. M.

ADMINISTRATION. The term administration is not easy to define. It is oftenest used to describe the executive business of the state. The functions of the state are usually classified as legislative, judicial, and executive, and this classification, while open to many objections, is as good as any other that has been suggested. If we adopt it and take administration as equivalent to the executive function, administration will practically comprehend all the activities of the state with two important exceptions, the function of making laws—the legislative function—and the function of interpreting laws—the judicial function. Administration in this sense includes an immense number of subordinate functions, which demand separate treatment. In a general view of administration it is only necessary to discuss the following topics: (I) The sphere of administration as defined (a) by theoretical writers, (b) in concrete historical instances. (II) The organisation of administration. (III) The relation of the administrative organisation to (a) the sovereign person or body of persons, (b) the individual citizen. (IV) The economic aspects of administration.

I. *Sphere of Administration* (a) as defined by theoretical writers. The innumerable theories on this subject may be reduced to three types, the *laissez-faire* type, the *socialist* type, and the *empirical* type. The LAISSEZ-FAIRE theory may be stated thus: Individual liberty is the one indispensable condition of goodness and happiness. Constraint is put upon the individual by any and every action of the state. The action of the state is therefore an evil to be reduced within the narrowest limits. The state, therefore, should undertake only those functions which cannot possibly be discharged by private persons, singly or associated. Therefore administration should be restricted to protecting the individual from interference, either by lawbreakers at home or by enemies from abroad. The only useful departments of administration are the army, navy, and police. The *socialist* theory may be stated thus—The co-operation of all for the good of all is the one indispensable condition of goodness and happiness. This co-operation can be effected by the state and by the state alone. The action of the state is therefore a blessing to be extended as much as possible. Every human being should be an official either in training, on service, or pensioned off. Administration should be co-extensive with social life, and there should be as many administrative departments as there are branches of industry.

The *empirical* theory may be stated thus—Individual liberty and compulsory co-operation are not ends in themselves, but only means to human well-being. Some wants of society can be provided for only by individuals, other wants

only by the state; but there are many other wants of society respecting the satisfaction of which no general rule can be laid down. Experience must in each case decide what the state should and what it should not attempt. Different maxims will apply to different cases. What should be done by administration in any country will depend on the circumstances of that country. This theory being elastic, its professors differ greatly among themselves, some inclining to *laissez-faire* and some to socialism.

(b) The sphere of administration, as seen in concrete historical instances, has varied widely, although it has never corresponded to the requirements of extreme socialism or extreme *laissez-faire*. So long as society remains a collection of self-governing families, the sphere of administration, like that of legislation, is restricted. So long as population continues sparse, wealth restricted, and wants few, there is little work for administration. There is hardly a circumstance in the condition of a people which does not contribute to determine the sphere of administrative action.

II. *The Organisation of Administration.*—Administrative organisation takes innumerable forms. But the character of an administrative system depends mainly on the question whether it is carried on by paid officials (in which case it is popularly called a bureaucracy), or whether it is carried on by unpaid citizens (in which case it is popularly called self-government). With this distinction is connected the distinction between a centralised and a localised administration. A centralised administration must, necessarily, be conducted by paid officials, since private persons cannot regularly travel long distances to take part in administrative work, most of which lies outside their knowledge or interest. A localised administration might be wholly conducted by paid officials of the local authority. But in practice it is usually in great measure conducted by private persons, who make up for the want of professional skill by the knowledge of their own wants, and give their unpaid service because they obtain an indirect return in power, consideration, and the satisfaction of managing their own affairs.

BUREAUCRACY and self-government must not, however, be regarded as mutually exclusive systems of administration. In all civilised states they supplement one another, although their relative importance is hardly ever in two instances the same. It is a mistake to suppose that there is no self-government in Prussia, in France, or even in Russia. It is a mistake to suppose that bureaucracy does not play a great part in England. In fact the administration of a civilised state is so serious a task as to demand all the power of bureaucracy and self-government combined. The paid official has,

or should have, the advantage in professional knowledge, professional skill, professional discipline, whilst the unpaid citizen has, or should have, the advantage in familiarity with local requirements, in local patriotism, and in freedom from technical prejudice and routine. An ideal system would make the unpaid citizen do as much work for the public as could be got out of him, and ensure his doing it properly by providing official information, supervision, and audit. A certain independence is necessary to make unpaid work attractive to able and honest men. On the other hand some duties can never be efficiently discharged by unpaid officers, because they need a special training and a special skill.

Administrative organisation admits of innumerable variations in detail. A certain similarity may nevertheless be noted in the administrative systems of states which are similar in extent and civilisation. In very small states the administrative system must necessarily have rather a municipal than an imperial character. Thus in the states of ancient Greece and of ancient and mediæval Italy, we find administrative organisations suited to the wants of a single town (see *CITY—ANCIENT, MEDIÆVAL*). When the state expanded beyond these dimensions a municipal had to be transformed into an imperial administration. The most striking instance of this process is afforded by the history of Rome. But in very large states the imperial and the municipal organisations are distinct from the first. The central administration is from the first contrasted with the local administration. Both, however, are servants and representatives of the state. Both exist in order to carry out its laws. Their separation is due to the necessities of public business. It is qualified by the superior power of the central as compared with that of the local authority, and of the sovereign as compared with both. Yet it is so important that each must be considered by itself.

Central Administration in modern Europe has had its root in the power of the monarch and has grown with the growth of that power. Thus in France the development of the central administration is almost co-extensive with the political history of the nation. In England, before the Conquest, there was hardly anything which could be called a central administration, although the local administration was tolerably complete. After the Conquest the nucleus of a strong administration was created by the Norman kings, who had to maintain their authority at once against a recently conquered people and a lawless feudal nobility. By the *DOMESDAY* survey the central government was, for the first time, informed of the population and resources of the kingdom. The taxes were much augmented and the exchequer was organised for the business of collection and management. The circuits of the itinerant justices, at

first designed as much for financial as for judicial business, began under Henry I. and were systematised by Henry II. By means of these circuits the central administrative authority was placed in direct contact with the local administrative authorities. Great works of architecture were executed at the royal expense. Mercenary armies were frequently employed. But the administration as yet concerned itself with a few comparatively simple matters. It was still indissolubly blended with the economy of the king's household. Throughout the Middle Ages public health, public communications, and police in so far as provided for, were in the hands of the local authorities. The local authorities enforced the many regulations respecting agriculture, manufactures, and trade, which were enacted either by themselves or by parliament. *EDUCATION* and the *RELIEF* of the poor were for the most part left to the care of the church. From the accession of the house of Tudor down to our own time the strength and activity of the central administration have constantly grown, but so gradually and irregularly that a summary account of the change is almost impossible. The following are the chief points which call for attention. During the 16th century the central administration is in the hands of the monarch and his privy council, whose power is seen rather in particular arbitrary acts than in a minute official interference with ordinary life. By the political revolution of the 17th century a prime minister depending on the House of Commons and a cabinet are substituted for the king and privy council as heads of the administration. The distinction between the *CIVIL LIST* (*q.v.*) and the rest of the public expenditure prepares the way for the ultimate total separation between the royal household and the central administration. At the same time the establishment, first of a regular navy, then of a regular army, and the growth of commerce and of colonies, involves the creation of new administrative departments. But every addition was made piecemeal, so that the central administration in the last century presented a scene of extraordinary confusion. In the 19th century, especially since the passing of the Reform Act of 1832, the central administration has been almost completely transformed. At the accession of William IV. the civil list was so arranged as to complete the separation between the personal income of the monarch and the other public charges. The *POOR LAW* Amendment Act of 1834 established the poor law board, since developed into the local government board, a body which supervises and controls the great majority of local authorities. The modern legislation on public health, beginning with the act of 1848 and consolidated by the *Public Health Act, 1875*, is also enforced by the local government board. The Committee

of Council of Education, established in 1839, became in virtue of the Education Act of 1870 an education department controlling the public elementary education of England. The military and naval departments have undergone, and are still undergoing, various modifications.

Local Administration.—The character of a system of local administration depends chiefly upon (a) the mode in which the country is distributed into administrative areas; (b) the constitution of the administrative authorities; (c) the functions entrusted to them; and (d) their relation to the central administrative authority. (a) In modern states it has generally been found advisable to divide the territory into at least three species of administrative areas, the smallest being the TOWNSHIP, PARISH, or COMMUNE, the intermediate being the hundred or UNION or arrondissement, and the largest, the COUNTY, province, or DEPARTMENT. The whole territory is thus divided into three systems of areas. But certain parts of the territory, especially towns and cities, differ so much from the rest in requirements and resources that they are usually constituted into special administrative areas. The space covered by these areas may or may not be withdrawn from the general subdivision. Thus many of the larger English cities and towns possess all the attributes of counties, but they are distributed into parishes.

Again, the larger areas may be formed by grouping the smaller areas, or they may have no reference to them. Thus in England the union area has always been made up by grouping a number of poor-law parishes; but these parishes may be in more than one county, so that the boundaries of the union often intersect those of the county. Again, the union area and the area of a municipal borough may coincide, but generally they have been traced without reference to each other, and a municipal area may contain fragments of two or three poor-law areas. Besides these, many other administrative areas have been created at different times and have not been harmonised with one another. This confusion of areas is, however, almost confined to England, and is being gradually mitigated. In England and elsewhere different methods of division have prevailed in different periods. The county has always remained the largest administrative area; but the HUNDRED has almost disappeared, whilst the POOR-LAW union is quite modern; and in the lowest range the township has in many instances been succeeded by the MANOR, and this again by the parish, civil or ecclesiastical.

(b) The constitution of the local authority in each area admits of much variety, but is generally reducible to one of four types; an assembly of all householders in the area, an assembly of elected representatives, a comparatively small ruling body recruited either by co-optation or by the selection of the supreme

government, and a staff of officials paid by, and immediately controlled by, that government. Thus the Anglo-Saxon township and the township of New England had as their authority the assembly of householders, and the same type of authority appears modified by feudal influence in the courts of the mediæval manor, and modified by ecclesiastical influence in the general vestry of the modern parish. Something similar is seen in the village council of eastern Europe and of Asia. But this type of authority is suitable only to the smallest area. The second type of authority, the elective assembly, is seen in the English select vestry, board of guardians, and modern municipal and county councils, and generally in the urban communities of the civilised world. Unlike the popular assembly, it is compatible with an extensive area and with multifarious administrative duties, and as it harmonises with democratic sentiment, it is coming into more general employment. The third type of authority, the exclusive body, was seen in many English municipal corporations before the act of 1835, and in the English county authorities before the act of 1888. Some of the municipal bodies of this class renewed themselves by co-optation. The Quarter Sessions were recruited by the appointment of the crown from a list presented by the lord-lieutenant, and composed of persons having a certain property qualification. The fourth type of authority, the staff of government officials, is almost unknown in England and is not common anywhere. But in many countries the head of the administrative body, and the possessor of all real administrative power, the prefect or mayor, is a government official, and his elective colleagues exist chiefly in order to disguise the fact that there is no real self-government.

(c) As regards the functions of the local authority, these have undergone many changes. In England they originally comprised, besides certain legislative and judicial duties, the duty of maintaining a police, the duty of keeping up public communications, the duty of taking certain precautions for the public health by removal of nuisances, etc., and the duty of enforcing a multitude of regulations as to weights and measures, the quality of goods offered for sale, especially provisions, and other matters connected with manufactures and commerce. A series of statutes culminating in the poor law of Elizabeth passed in 1601 added the function of relieving the poor, formerly left to ecclesiastical or to private charity. The duty of providing for the public health, which had been little more than nominal, has become in our time a great branch of local administration. The duty of providing for elementary education is still more recent. Besides these functions local authorities have acquired, under a number of general or special acts, power to

provide almost everything which can minister to the health, decency, comfort, or amusement of a dense population—gas and water works, markets, museums, galleries of art, libraries, parks, gardens, baths, lodging-houses, and burial grounds.

(d) Relation to the central authority. This relation differs widely not only in different states but in the same state at different times, or with respect to different classes of local authority. Thus in England the control of the central authority has usually been less strict than in France. In England there was hardly any effective control of local administrative bodies by a central authority, until the Poor Law Amendment Act of 1834. The poor law commission first, and afterwards the local government board, have exercised over the union authorities a pretty complete control. It has been said that the only question with respect to which a board of guardians has any real discretion is that of granting or refusing applications for relief. The municipal corporations on the other hand, especially those of the largest boroughs, have retained a real independence.

The central administrative authority may influence the local administration in one or more of the following ways: (a) By collecting, preserving, and circulating statistical and other information useful for administrative purposes; (b) by enacting rules to guide the local authority; (c) by periodical inspection or constant supervision to ensure the observance of these rules; (d) by periodical audit of the accounts of the local authority. The means of enforcing this control are various. The extreme penalty for disobedience is the dissolution of the offending local authority. In England a board of guardians may be dissolved by order of the local government board, but a municipal corporation cannot be dissolved by any merely administrative authority. A lighter penalty is the withholding either altogether or in part of grants of money, ordinarily made by the central to the local authority. Thus a school board in England obtains the government grant only in so far as the education given by it satisfies the education department.

III. *Relation of the Administrative Organisation to (a) the sovereign person or body of persons; (b) the individual citizen.* The sovereign in each state will necessarily control the administration, but this will be effected in different ways. Under the older form of constitutional monarchy the monarch made laws by the advice of his parliament and carried on the administration by the help of his council. The ministers were his ministers, and through them he controlled every branch of the administration. At the same time he depended on his parliament for the necessary funds, and his ministers were liable to parliamentary impeachment. Under the later form of constitutional

monarchy, the prime minister takes the place of the king and the cabinet takes the place of the privy council. The prime minister and cabinet owe their power to the support of the majority in the more popular house of the legislature. Thus that house which is virtually sovereign has a direct control over the administration. Most modern republics are organised on the model of constitutional monarchy. In the United States the president is perhaps more influential in the administration than was formerly the king of England. The ministers are his ministers and do not even sit in congress. In France the president takes the place of a modern king of England, the prime minister is the real ruler of the state, and he and his cabinet hold office at the pleasure of the majority in the chamber of deputies. In despotic monarchies the monarch has sole control of the administration, unchecked either by a power of withholding supplies or by a power of impeachment residing in a representative body.

The relation of the administrative system to the individual citizen differs in different countries according to the nature of the authority empowered to decide upon their respective rights and duties. In many despotic states of a rude type administrative and judicial functions are united in the hands of the monarch and the provincial governors. Under this system there can be little protection for the individual citizen. In the despotic states of civilised Europe the administrative and judicial organisations were usually kept distinct, but acts done in the course of administration were placed under a special law administered by special tribunals, and in many cases action could not be taken before these tribunals without the previous sanction of the government. In France this system survived many revolutions and has but recently been modified. It is also found more or less developed in many other continental states. In England a special administrative law and special administrative tribunals are unknown. Every branch of the public service has its own regulations and discipline, but these affect only its members. Every administrative authority stands in the position of a private person empowered by law to discharge certain special functions. Acts done in the course of administration are on the footing of all other acts. If a policeman uses excessive violence in taking a prisoner to the police station, or if a collector of taxes exceeds his lawful powers, redress is afforded by the ordinary courts of justice applying the same laws and observing the same procedure as in any other case of assault or of extortion. So too the rights and duties of any government department or local authority are determined like those of any private individual.

IV. *Economic Aspects of Administration.*—These are numerous and complicated. In the first place administration includes the business

of raising the PUBLIC REVENUE. It thus includes the whole of public finance. In this light the questions as to the safe limits of TAXATION, as to the best kinds of taxes, as to the most economical methods of levying them, as to the least harmful ways of raising and the least oppressive modes of liquidating public loans, are all administrative questions, although they are so extensive that they cannot be treated in this article. In the second place administration includes the business of spending the public revenue. That business suggests the inquiry as to the proper functions of the state. What should the state attempt to do itself? what should it attempt to regulate? what should it leave entirely out of view? These questions raise other than economical issues; but they raise economical issues too. Thus experience shows that in countries where capital and knowledge are rare many of the requisites of production such as RAILWAYS, CANALS, aqueducts, Docks, drainage, and irrigation works, can be provided only by administrative effort. By providing these the state does not lessen individual energy or narrow its field of action. On the contrary, by facilitating production these administrative undertakings have often strengthened the spirit of individual enterprise and accumulation. A notable illustration of the service which may thus be rendered by an efficient administration is seen in the growing prosperity of British India. In a later stage of economic development more can be done by private effort and less needs to be done by administration. But the growing complexity of life and industry, the gathering of multitudes into large cities, the concentration of industries in huge factories, the production of the necessities of life, not by domestic labour, but by scientific processes on a vast scale, the new combinations of labour and of capital, the increased attention given to health, the more exacting demand for enjoyment, and education, the dissolution of old customs and beliefs, all these changes bring with them difficulties which compel interference here and interference there and a vast process of administrative regulation. No general rule can be laid down respecting the effect of such regulation; the effect can be known in each case only by experience. All that can be said is that before regulating any branch of industry the fullest information possible should be procured, and that all new regulation should be tentative. In the third place we have to consider the economic effect of efficiency or inefficiency in administration irrespective of its objects. The industry, the integrity, and the intelligence of the administration are great economic forces. Compare the administrative staff in Turkey with the administrative staff in Prussia and consider their influence on the economic condition of their respective countries. If the

administrator is an official, his efficiency will depend greatly upon the spirit, education, and traditions of the service of which he is a member; if he is a private citizen, his efficiency will depend greatly upon the spirit, education, and traditions of the class from which he comes. In the fourth place the magnitude of the administrative staff is a circumstance of economic importance. An overgrown civil service means a great number of idlers and a waste of productive power, especially power of mind. It also means a heavier taxation of the productive classes (see BUREAUCRACY; CIVIL LIST; GOVERNMENT).

[For a general view of the modern state and its organs, see Bluntschli, *Theory of the State*; for the history of the English administrative system consult Stubbs's and Gneist's *Constitutional Histories of England*; for its present state consult the volumes on *Central Government*, *Local Government*, *The National Income and Expenditure*, *The State in Relation to Labour*, and *The State in Relation to Trade* in the English Citizen Series; and the statutes and other authorities to which they refer.]

F. C. M.

ADMINISTRATION, LETTERS OF. When a person dies intestate his real estate passes immediately to his heir, *i.e.* to the person designated by law as entitled to its enjoyment. His personal estate, however, has to be administered for the benefit of (1) his creditors, (2) of the next of kin entitled to enjoy the surplus after payment of his debts. The administrator is a person who takes out letters of administration, *i.e.* procures himself to be nominated by the Probate Division of the High Court to the administration of the estate. Letters of administration are granted usually to some of the next of kin; failing them, to a creditor, and, if there be no creditor, to any person whom the Court thinks suitable. Once appointed, the administrator very closely resembles an executor appointed by will. Like the executor the administrator, as such, has no beneficial interest in the estate, and no liability for anything beyond the assets which he receives. He is bound to realise the personal estate of the intestate to pay the funeral expenses and debts, and to distribute the balance, if any, among the persons entitled under the Statutes of DISTRIBUTION (22 & 23 Car. II. c. 10, and acts explaining or amending). He may himself happen to be one of these persons.

It may happen that although the deceased has made a will he has named no EXECUTOR, or that the executor named refuses to act, or becomes incapable, or dies before the testator. In any of these cases an administrator must be appointed, and his administration is said to be "*cum testamento annexo*," since it is his duty to give effect to the provisions of the will. Should the sole executor or the administrator be an infant, his guardian will obtain letters of administration "*durante minori etate*," that is, until the infant attains his majority.

Should the administrator die before he has fully administered the estate, a new administrator must be appointed. For the office of administrator does not pass like the office of executor to the personal representatives of the person who held it. The new administrator has administration "de bonis non administratis" (often termed "de bonis non") *i.e.* of goods not administered by his predecessor.

What would be the best law of intestate succession is a question which has been much discussed, and involves complicated economical considerations. But, whatever the nature of that law, the office of administrator of the estate of the intestate appears equally necessary.

[See Williams's *Personal Property*.] F. C. M.

ADMINISTRATOR. The personal representative of a deceased intestate or of a testator whose will does not appoint any executors, or whose executors are unable or unwilling to act. The nearest relative who is willing to act is appointed administrator, and in default of relatives administration may be granted to a creditor. The instrument certifying the grant is called "letters of administration." The personal estate of the intestate or testator (and since 1882 such real estate as was held by him in a fiduciary capacity) becomes vested in the administrator, who has to pay all debts chargeable to the estate, and to distribute the residue according to law, *viz.* in case of intestacy in accordance with the Statutes of Distribution and the modifying enactments (22 & 23 Car. II. c. 10; 1 Jac. II. c. 17), and, where there is a valid will in accordance with the directions contained in the same. In the latter case the grant is made "with the will annexed" (*cum testamento annexo*). E. S.

ADULTERATION. The alteration of an article into something inferior, but not readily distinguishable in appearance, by the addition of cheaper materials. Legislation has endeavoured to provide, in many instances, but not always successfully, that the articles thus deteriorated should be marked out so distinctly that the unwary may be always able to escape the pitfall. Against this endeavour the maxims of CAVEAT EMPTOR and, with less ground, of LAISSEZ FAIRE, are sometimes invoked. Occasionally even the spirit of class opposition (as when legislation against adulteration is promoted by producers whose interests are individually affected) is called up to hinder the prevention of the sale of something which, though confessedly not what it professes to be, is claimed to be a cheaper and as useful an article as that for which it is substituted. Professor Marshall observed (*Inaugural Address*, Co-operative Congress, Ipswich, 1889), in speaking of adulteration, "That term is often used so as to include open and undisguised changes in the character of goods to suit the wants and the tastes of consumers. But you seem to me to have a clear

duty: it is to explain to consumers what things are cheap and what things only appear to be cheap; to give them for their money as high class goods as you can afford, and as much truthful information about them as you possess."

AD VALOREM DUTY. A duty levied on a commodity in proportion to the value, in contrast to a specific charge on the quantity. At first sight this form of taxation appears the more equitable one. In practice, however, customs duties *ad valorem* have been found to work out with great inequality, and also to be inconvenient to levy for various reasons, among which are the following: (1) the difficulty of ascertaining correctly the values of the goods charged with the duty; (2) the opening to fraud; (3) the delay and hindrances caused to importers and others. In theory it might be supposed that *ad valorem* taxes on all commodities would not affect their relative values, but it has been maintained that, owing to the different proportions in which fixed and circulating capitals enter into their cost of production, this would not be so. Thus J. S. MILL remarks (*Principles of Pol. Econ.* bk. v. ch. iv. § 1) that in case of an *ad valorem* duty on all commodities exactly in proportion to their value there would be a disturbance of values owing to . . . "the different durability of the capital employed in different occupations." An *ad valorem* duty was levied at an early date in this country. There existed *temp.* Edward I. an *ad valorem* duty of 3d. upon every *librate* or twenty solidi of lead and tin (*Customs Revenue of England*, Hubert Hall, vol. i. p. 66). At the present date *ad valorem* duties, as such, are practically unknown to the British fiscal system; the wine duties levied differently on different classes of wine approach them (see TAXATION).

COURNOT arrives by mathematical reasoning at the conclusion that the effect of an *ad valorem* tax of so much per cent will be the increase of the expenses of production (including transmission into the consumer's hands) by a larger percentage. Let n be that fraction of the value which constitutes the tax. Then the effect is as if the expenses of production had been increased in the ratio $1 - n : 1$. Whence it follows that, other things being equal, a tax will be heavier as the expense of production is greater, that is "as in the price of the commodity a smaller part represents the profit" of the seller. The theorem is true both in a *régime* of monopoly and of competition.

ADVANCES. In the writings of the French Physiocrats "advances" are an outlay of wealth with a view to some future return, as opposed to an outlay for immediate consumption. This notion was wide enough to include the advances of food made by a parent to his infant child (DAIRE, *Physiocrates*, ed. 1846, p. 391), and might include the means of preparing a feast or making a toy. But more commonly the word was used almost as we now use "capital." "The weapons made by the first hunter were a great augmentation of his capital or his advances" (Daire, *ib.*) The physiocrats distinguished three sorts of advances in agriculture:—(1) The ground expenses or *avances foncières* which are laid out once for all, *e.g.* on clearing, draining, etc.; (2) The original advances or *avances primitives*, needing occasional repair or renewal, *e.g.* on ploughs, carts, oxen, and manure; (3) the annual expenses, or *dépenses annuelles*, which need regular and continual renewal, *e.g.* wages of labourers and food of cattle (Daire, *ib.*, p. 344). TURGOR applies similar distinctions even to manufacture (*Form. et Distrib. des Rich.* § 52 *seq.*) The distinction drawn by ADAM SMITH between fixed and circulating capital rests not on this difference of durability but on the retention or non-retention of the capital in the hands of the investor. RICARDO adopts the criterion of durability while preserving the twofold instead of the physiocratic threefold division. Later economists have followed Ricardo, though most of them admit with him that such a distinction, being one of mere degree, cannot be closely pressed. The "advances necessary to produce a commodity" are sometimes described as synonymous with the capital necessary to produce it (*e.g.* MALTHUS, *Pol. Econ.*, 1st ed., p. 293); and sometimes we hear of the "advance of capital" (Senior, *Pol. Econ.*, p. 194); but it is specially in relation to wages and the wages fund that the word "advances" has been most frequently employed (see CAPITAL; W. N. SENIOR; WAGES FUND). The financial sense of the word (*e.g.* advances to government by the bank) calls for no special consideration here. J. B.

ADVENTURERS, MERCHANTS. English companies for the conduct and extension of foreign commerce have been of two different kinds—(1) Regulated, and (2) Joint-stock companies. "When they do not trade upon a joint stock," says ADAM SMITH (bk. v. ch. i.), "but are obliged to admit any person, properly qualified, upon paying a certain fine and agreeing to submit to the regulations of the company, each member trading upon his own stock and at his own risk, they are called regulated companies.

When they trade upon a joint stock, each member sharing in the common profit and loss in proportion to his share in the stock, they are called joint-stock companies." The oldest and most celebrated of the former class was the company of Merchants Adventurers. To understand its history, we must advert to the system of the STAPLE, established *temp.* Henry III. Certain places on the continent were fixed by royal authority as the sole marts for English wares, where goods were to be "collected, tried, and assessed." During the 13th and 14th centuries the five great exports of England were wool, woollens, leather, tin, and lead, the first by far the most important. Bruges in Flanders was most commonly the seat of the Staple, but the English kings frequently transferred it to other continental towns, as, for example, to Bergen, Dort, and Calais, usually for political rather than commercial reasons. When the English cloth manufacture began to assume importance, the company of Merchants Adventurers came into existence, and from the first it was most closely, though not exclusively, associated with the export of cloth. Wheeler, secretary of the company, says of it (*Treatise of Commerce*, 1601): "It consisteth of a great number of wealthy and well experimented merchants, dwelling in diverse great cities, maritime towns, and other parts of the realm, to wit, London, York, Norwich, Exeter, Ipswich, Newcastle, Hull, etc. These men, of old time, linked and bound themselves together in company for the exercise of merchandise and seafare, trading in cloth, kersie, and all other, as well English as foreign, commodities vendible abroad." The origin of the company is obscure, and the date of its incorporation cannot be determined with certainty. But privileges were granted to it in the 14th century by the Count of Flanders for trading in his dominions, and Edward III. fixed Bruges as the place to which its commodities should be carried. In 1407 Henry IV. gave its members the right of appointing their own governor. About the middle of the 15th century they came into conflict with the Merchants of the Staple. The latter alleged that the Merchants Adventurers had no right to exact the regular contribution to their society from all persons exporting cloth to the Low Countries. The quarrel came to a head *temp.* Henry VII., who favoured the claims of the Merchants Adventurers, because they had given him valuable help during his diplomatic differences with Margaret of Burgundy arising out of the assistance she gave to Perkin Warbeck. They had prevented distress and discontent among the artisans by "taking up the commodities of the kingdom, though they lay dead upon their hands for want of vent" (Bacon, *Hist. of Henry VII.*) The amount which the company could exact for membership was limited by act of parliament, but its right to control

the cloth-trade to the Netherlands was recognised. It received, in 1501, a charter authorising its members to elect a president and twenty-four assessors, to make their own decrees for the management of the trade, and to punish transgressors. The Star Chamber, in 1505, decided that the merchants of either of the contending companies who wished to share in the trade of the other must pay the ordinary contribution. From this time the extension of English commerce was principally the work of the Merchants Adventurers. Henry VII. had obtained from the government of the Netherlands in 1496 a treaty known as the *INTERCURSUS MAGNUS*, which secured mutual freedom of trade; the merchants of both countries were allowed proper houses for residence and for the storing of their merchandise. The English traders were also permitted (1499) to sell their woollen cloths in other towns of the Netherlands besides Bruges and Antwerp. The further right to sell by retail was afterwards obtained by pressure exercised on the Archduke Philip, when driven by a storm on the coast of England in 1506; but this concession was strongly protested against by the Flemings, who called the agreement the *INTERCURSUS MALUS*, and it was before long revoked. Antwerp had drawn away from Bruges the greater part of the English trade by offering special advantages, and though the return of the Merchants Adventurers to Bruges had been agitated from time to time, it now soon ceased to be thought of, and Antwerp became the great market for English cloth. About the same time (1516), the King of Portugal removed to Antwerp the staple for oriental wares, and the Portuguese merchants thenceforth purchased there the English cloth which they sold in the eastern countries and in Brazil.

The second great struggle of the Merchants Adventurers was with the Hanseatic traders in England. In the 14th century the *HANSEATIC LEAGUE* (*q.v.*) had been a great power, but towards the end of the 15th it began to decline. It had established itself (*temp.* Henry III.) strongly in England. Its merchants assisted the English kings financially and were therefore favoured. Having first settled in some of the towns on the east coast, they finally concentrated themselves in the *STEELYARD* at London, where they had an establishment imposing by its magnitude and strong defences. Ar rigorous discipline was maintained amongst the *EASTERLINGS*, as they were called, the jealous hostility of the city population requiring them to be perpetually on their guard. The Merchants Adventurers, when they had successfully asserted their claims against their English rivals, were eager to get into their hands the whole export trade, at least that in woollen cloth. They were jealous of the comparative immunity from customs enjoyed by the cloths exported through the Hanse traders. The treaty of Utrecht,

1474, had provided that Englishmen should possess the same privileges in Hanseatic towns abroad as the Germans did in England. But the English merchants complained that this reciprocity was not accorded to them. Efforts were made in consequence by Henry VII. to obtain such compacts with Denmark, and such a footing in Livonia, as would to some extent make English traders independent of the Hanse. But political motives led the king to recede from the attitude thus taken up, and to confirm to the Hanseatic traders the privileges they enjoyed in London. Henry VIII. also, unwilling to provoke the enmity of the League, continued to protect the rights of the "Merchants of the Steelyard."

Meantime the Merchants Adventurers had been pushing with great energy their trade with the Low Countries. Wolsey, dissatisfied with the treatment of English traders in the Netherlands, sought to remove the staple for cloth to Calais, and Thomas Cromwell wished to establish it in England. But both these projects failed. The latter proposal was revived in the reign of Elizabeth, and was strongly advocated by Cecil; but the Merchants Adventurers preferred to continue trading to Antwerp, probably because the new arrangement would have necessitated the granting to foreigners in England an equality with the native traders. The Duke of Alva, when sent to the Netherlands by Philip II., seized the property of the English merchants at Antwerp, and they in consequence withdrew in 1578 to Hamburg, where special inducements were offered them. Antwerp, as a commercial centre, was ruined by the civil war; many of the Netherland merchants also removed to England, and a great number of artisans did the same, thus introducing branches of the cloth manufacture which had not previously been practised there. Already in 1552 the English merchants had obtained from the Privy Council a decree abolishing the privileges of the Steelyard, and reducing the Hanse traders in England to the position of other foreigners. Their privileges were, however, partially restored under Mary, and in the early part of Elizabeth's reign; but, failing to recover their old position, they procured the expulsion from Hamburg of the English merchants who had been invited thither. After various measures of retaliation on both sides, the English were, in 1597, expelled from all the dominions of the Empire. Elizabeth forthwith directed the civic authorities of London to close the Steelyard, and ordered the German merchants to leave England, thus bringing to an end the history of the Hanseatic league in this country.

After this period, we find the "foreign residence or comptoir" of the Merchants Adventurers fixed successively at Groningen, Delft, and Dort. In 1649 they are invited to return to Bruges, but decline to do so. They are then

finally established at Hamburg, and come to be commonly known as the Hamburg Company.

The general model of the Merchants Adventurers' Association was followed in the regulated companies which are the great feature of English commerce from the middle of the 16th century. To encourage the trade with Russia opened by Chancellor, Queen Mary incorporated the Muscovy Company, and English factors settled at Novgorod; the charter of the company gave it the exclusive right of trading to Russia. The Eastland or Baltic Company was incorporated 1579, the Turkey Company 1581, the Mauritania Company 1585, and the Guinea Company 1588. (See COMPANIES.)

Mercantile companies, with special powers entrusted to them by the government for the protection of trade, may, Adam Smith remarks, "have been useful for the first introduction of some branches of commerce, by making at their own expense an experiment which the state might not think it prudent to make." And the trade of England was certainly in its early stages greatly furthered by the action of the Merchants Adventurers. The abuse to which such corporations are liable is the restriction of the greater part of the trade to the directors of the company and their particular friends, and the enforcement of burdensome regulations with a view to that end. The Merchants Adventurers were not always free from this evil; but by the interference of parliament, as we have seen, the terms of admission were reduced, and, ANDERSON tells us, from the middle of the 17th century no complaint was made against them. Smith admits that the Russia and Eastland Companies were not, in his time, oppressive. The Turkey trade, he says, notwithstanding recent legislation to open the corresponding company fully, was still considered by many people as very far from being altogether free. He does not believe the AFRICAN COMPANY, though accused of "restraining the trade, and establishing some sort of improper monopoly," really open to that charge. But he censures it on the ground that it did not fulfil its duty of properly maintaining forts and garrisons. And, where such maintenance is necessary from the trade being with barbarous or semi-civilised communities, he holds that regulated companies are less likely to attend to it than joint-stock companies, first, because the directors of the former have no interest in the prosperity of the general trade of their company, and may even be gainers by its limitation; and, secondly, because they have no adequate fund at their disposal, the company possessing no common stock, and being dependent for their outlay on the casual revenue from admission fines and corporation dues. While Smith appears scarcely to allow the regulated companies due credit for the part which most competent authorities

assign them in the extension of English commerce, it is, doubtless, true that, when he wrote, the services which such corporations were fitted to render were substantially exhausted, and, as he says, the highest eulogy that could be bestowed on them was that of being merely useless.

[J. Wheeler, *Treatise of Commerce*, 1601.—A. Anderson, *Historical and Chronological Deduction of the Origin of Commerce*, 1764.—G. Schanz, *Englische Handelspolitik gegen Ende des Mittelalters*, 1881.—W. Cunningham, *Growth of English Industry and Commerce*, 1890.—In the present article we are much indebted to *Foreign Commerce of England under the Tudors* (Stanhope Essay for 1883, by John Bruce Williamson), an excellent abstract of Schanz, with information from other sources.] J. K. I.

ADVICE. Primarily, an order given by one person to another to perform some act of business, such as the payment of a bill of exchange, for him—used also in the sense of giving information on business matters more generally.

AFRICAN COMPANIES, EARLY. The circumstances of trade with Africa, or rather with Africa excluding the Mediterranean coast, were of such a nature as to favour particularly the formation and maintenance of privileged trading companies. The trade was sufficiently dangerous to suggest the need of special privileges, and not sufficiently profitable to permit of being carried on without them. England, however, was not the first country to enter into trading relations with the west coast of Africa. Portugal held that position, and practically enjoyed a monopoly till 1536. In that year we hear of English adventurers and of their success. Benin on the Guinea coast was the attraction of the traders. The venture was probably repeated more than once; without leading immediately to the formation of a company. That result, however, soon ensued, and the first charter was granted, the precursor of many others.

(1) 1588; Elizabeth granted to certain merchants of Devonshire, Exeter, and London a charter giving exclusive trading privileges for ten years to the rivers of Senegal, Gambia, and the neighbouring district. This company, called *The Guinea Company*, was in reality the forerunner of the African companies, among which it may itself be numbered. They were all companies formed to trade with the west coast. Under the auspices of this company several voyages were made, the chief goods brought back being pepper, ivory, palm oil, cotton cloth. It seems to have been very unsuccessful, owing in part to the action of "interlopers" or independent traders.

(2) 1618; a new exclusive charter to Sir Robert Rich and other Londoners. It too was unsuccessful, first through the action of private traders and secondly owing to the very small profit gained by those engaged in this trade

before the development of the slave trade between the west coast and the English plantations in America.

(3) 1631; a new company was formed, the charter granted to Sir Richard Young, Sir Kenelm Digby, and others for thirty-one years, the limits assigned extending from Cape Blanco to the Cape of Good Hope. Similar causes to those before enumerated appear to have led to its dissolution.

(4) 1662; a fourth company formed this time with the definite object of conveying 3000 slaves a year to the American settlements. Its development was interfered with by wars with the Dutch, and it gave way to—

(5) 1672; the *Royal African Company*, which really bought out the rights of the proprietors of the foregoing. These, like other trading companies of the time, were based on grants of exclusive privileges to certain persons made by royal charter. As such they were doomed by the act passed after the Revolution of 1688, whereby all exclusive privileges except those authorised or granted by parliament were withdrawn. The African trade was thus thrown open though it must be remembered that the company was not destroyed. Its exclusive rights were taken away; but (1698) some part of these rights were restored by statute (9 & 10 Will. III.) in regard of the settlements and forts which had to be supported. Traders other than those belonging to the company were burdened with differential duties. From this time onwards disputes continually arose as to the expediency of restriction. But despite the attention devoted to the trade, it continued to be most unprofitable. At one time its stock dropped to 4½, and though it rose above this low figure it seems never to have approached par except at the time of the SOUTH SEA BUBBLE. In consequence of the low credit it stood in, and of the increased liabilities incurred by the company, it was resolved to transfer its property to a new company composed of the proprietors of the old company and its creditors, and—

(6) 1750; a new African company was established. It was of course without exclusive rights. In 1752 the property of the former company was finally transferred to its hands.

[Anderson, *History of Commerce*.—Macpherson, *Annals of Commerce*.—Rymer, *Fœdera*.—Lansdown MSS. in Brit. Mus.] E. C. K. G.

(7) 1791; the *Sierra Leone Company* may be classed with the early African companies in the sense that the acts of parliament establishing and determining it both precede the act determining the old African companies.

The *Sierra Leone Company* originated in the philanthropic schemes of certain gentlemen who (1787) formed themselves into a committee and raised a fund for assisting destitute blacks, most of whom had been the victims of the slave trade, to settle in Sierra Leone. The

project very quickly took the form of a regular company, and in 1791 an act was passed incorporating the *Sierra Leone Company*. In 1800 letters patent were issued definitely granting the peninsula of Sierra Leone, so far as was in the power of the crown, to the company. But the French war very adversely affected the fortunes of the company, and heavy subsidies were granted from imperial funds to sustain it, so that in 1807 an act was passed providing for the extinction in seven years' time of the *Sierra Leone Company* and its rights over the colony. In 1809 a charter was granted to the company providing for the "Colony of Sierra Leone," and after the powers given to the company had expired, this charter was (in 1821) regranted direct to the colonists, who were then placed directly under the crown of Great Britain.

C. A. H.

AFRICAN COMPANIES, RECENT. It would appear from a review of historical facts that in periods when a number of different civilised nations have been actively competing for the possession or settlement of an unallotted region, the favourite method of occupation has been the quasi-national company. The recent allotment of a great portion of the African continent amongst chartered companies is on a par with the early settlement of North America and the West Indies.

Putting aside the Congo Free State, which in some respects is analogous to a chartered company, we have in order of time the *Royal Niger Company* (chartered as the *National African Company* in 1886) dominating the basin of the river Niger on the west, the *Imperial British East African Company* (1888) on the Somali coast to the east, and the *British South African Company* (1889) between the Zambesi and the British colonies to the south. All these are British companies, and all hold a royal charter. A German South-West African Company has been at work for some years with indifferent success, and does not seem to enjoy any privileged position. The *German East African Company*, which is chartered, was formed in 1888 by a coalition of the private Commandite Company and Karl Peters and Co., to compete with the British company in the Somali and Zanzibar districts.

An amalgamation of powerful houses in West Africa is at this time moving to obtain a charter as the *Oil Rivers Company*. The *African Lakes Company* is unchartered and is likely to become merged with the *British South African Company*. The *Congo Company* is an ordinary one, with its seat of operations in the Congo Free State. The "*United African Company*" of 1879 was the parent of the "*National African Company*," now the *Royal Niger Company*; it successfully competed with and eventually absorbed two French companies which received considerable support from the government.

The new British companies differ from the last of the old ones—the *Sierra Leone Company* (see AFRICAN COMPANIES, EARLY)—in being avowedly commercial. As explained in the article on COLONIES, *Government by Companies* (q.v.)—they are similar in conception and aim to the old *Royal African* and *Guinea Companies*. Governments, however strong, have usually shrunk from the responsibility of administering a large unknown tract of territory, but have been willing to encourage the hazards and adopt the successes of a company. In the first blush of African development Bechuanaland was annexed as a protectorate under the immediate care of the British crown, but this policy was too severely criticised by the timid to encourage its repetition in dealing with African territories. When the movement went on and in various parts of Africa a number of ordinary commercial companies had secured valuable concessions or established the nucleus of a trade, their present security and the future establishment of a colonial dependency was assured by their consolidation into large associations under boards of directors of recognised substance, with wide powers over considerable extents of territory, and enjoying the prestige of a royal charter.

The charters of the existing companies are all very similar. That of the *South African Company* has a special colouring, in that two or three of its provisions (Clauses 10, 17, 18) appear to contemplate the future transfer of its powers to a crown colony; for instance it may make "ordinances" subject to confirmation by the secretary of state. All through the charters modern caution and modern philanthropy are conspicuous. The control of the crown through one of the secretaries of state is secured at every point, especially as regards any foreign relations. In the case of the *Royal Niger* and *Imperial British East African Companies* this control is exercised through the foreign office; in the case of the *British South African Company* through the colonial office. The difference of the controlling department was determined solely by the fact that in the case of the first two companies their immediate contact was with foreign states, in that of the *British South African Company* it was with British colonies and protectorates. The stipulations in respect of the slave trade and liquor traffic with the natives are the offspring of a humanitarian age. Subject to these limitations the companies have wide powers, not only of carrying on commerce and industries on their own account, but of granting concessions and powers to individuals for every sort of undertaking. They have all the attributes of large joint-stock companies with some of those of independent states. But they cannot enjoy or create any monopoly of trade.

The *Imperial British East African Company*

has at present less individuality than the others; a great part of its sphere is within the territory of the sultan of Zanzibar, and there it is bound to use the sultan's flag and conform to the sultan's trade restrictions. Herein the different genius of the British and German companies (see COLONIES, *Government by Companies*) was well illustrated. Both had their sphere of operations in the territory of the sultan; the British company, as just mentioned, was carefully kept by the British government subservient to their ally; the German company everywhere hoisted the German flag and displayed its nationality; it was, in fact, the German government working through the company for paramount influence.

The sphere of influence dominated by Germany through its *East African Company* lies between those of the *Imperial British East African Company* and the *British South African Company*, stretching from the east coast inland to Lake Tanganyika and the Congo Free State, with which last it is continuous. It thus covers some of the richest country in the Continent, the object of considerable jealousy to English traders.

The commercial success of the *Royal Niger Company* has, on the whole, been considerable; that of the *South African Company* is yet in the future; the British and German companies in East Africa have hitherto cut each other's throats.

[The charters of the three companies are to be found in the *London Gazette* of 13th July 1886 (Niger),—7th September 1888 (East African),—20th December 1889 (South African),—and a short account of the first and last is contained in the *Colonial Office List* for 1890, published by Messrs. Harrison and Sons. The *Royal Niger Company* and *British South African Company* have printed interesting accounts of their development for private circulation.] C. A. H.

AGAZZINI, MICHELE (an Italian economist of the commencement of the 19th century), published a system of political economy not destitute of original ideas, or, at least, of an original manner of presenting old ones. He had a clear idea of what was later called by SENIOR and CAREY the *cost of reproduction*, and makes it the centre of his theory of value. Every producer, according to Agazzini, obtains for his produce a price determined by the cost (in labour and abstinence) which the consumer *saves*; this same law holds good for the price of commodities, of labour, and of capital. The law of supply and demand (he says) regulates current prices, and the cost of reproduction normal value. All this is, however, explained in a language totally lacking technical precision. His most important work was first written and published by him in French under the title:

La science de l'économie politique, ou principes de la formation, du progrès et de la décadence de la richesse, et application de ces principes à l'ad-

ministration, 1822. Paris et Londres, Bossange père. It was published at Venice in Italian in 1827. Later, in 1834, Agazzini published a critical essay on Smith, Say, and Malthus, in which only the history of the doctrines concerning value are noteworthy. He is particularly successful in the correct exposition of the doctrines of the mediæval canonists. *Sconvenevolezza delle teoriche del valore insegnate da Smith, dai professori Malthus e Say e dagli scrittori più celebri di pubblica economia*, Milano, Fontana, 1834. M. P.

AGENCY, LAW OF. An agent is a person authorised by another (called the principal) to act on his behalf. An agent authorised to act for a special purpose only is called a particular agent; if there is a general authority to act within a given sphere, the agent is called a general agent. A partnership is an instance of general agency in the widest sense, each partner being, as a rule, considered the agent of his co-partners for all purposes coming within the scope of the partnership business. An agent may not, according to English law, derive any concealed profit from his agency, and he may not, as a general rule, delegate his authority to another person. An agent may in his dealings with third parties act as principal, or he may state the fact of the agency without disclosing the name of the principal, or he may deal on behalf of a named principal. The rules of law concerning the liabilities and mutual relations of the various parties in all these cases are too complicated to be stated here, and the general rules are often modified by the customs of particular localities or particular trades. The authority of an agent acting on behalf of a corporate body cannot extend beyond the limits imposed upon the sphere of action of the corporation either by Act of Parliament, or by the charter of incorporation or by the memorandum of association (see *ULTRA VIRES*). E. S.

AGENTS OF PRODUCTION. The causes or requisites of production, often called "agents of production," may be divided into two classes: human action and external nature; commonly distinguished as "labour," and "natural agents." The first category comprises mental as well as muscular exertion; the second, force as well as matter. To the second factor is sometimes applied the term *land*: in a technical sense, denoting not only the "brute earth," but also all other physical elements with their properties. But this term is more frequently employed in another classification, according to which the agents of production are divided into three classes—land, labour, and capital. Of the two classifications which have been stated the former appears the more fundamental and philosophical. That "all production is the result of two and only two elementary agents of production, nature and labour," is particularly well argued by Böhm-Bawerk in his *Kapital und Kapitalzins*, pt. ii. p. 83. "There is no room for a third elementary source," he main-

tains. This view is countenanced by high authorities, of whom some are cited below. Even J. S. MILL, who is disposed to make capital nearly as important as the other members of the tripartite division, yet admits that "labour and natural agents" are "the primary and universal requisites of production" (*Pol. Econ.*, bk. i. ch. iv. § 1). Prof. Marshall, dividing the subject more closely, thinks "it is perhaps best to say that there are three factors of production, land, labour, and the sacrifice involved in waiting" (*Principles of Economics*, p. 614, note). For further remarks on the third species of agent see *CAPITAL*.

In the case where both labour and natural agents are required, the most frequent and important case, the question may be raised whether nature or man contributes more to the result. According to QUESNAY (*Mémoires*, Edn. Oneken, p. 331) land is the sole source of riches. According to Adam SMITH, in manufactures "nature does nothing, man does all" (*Wealth of Nations*, bk. ii. ch. v.) The better view appears to be that the division of industries into those in which labour does most and those in which nature does most is not significant. It is like attempting "to decide which half of a pair of scissors has most to do in the act of cutting" (Mill, *Pol. Econ.*, bk. i. ch. i. § 3).

Agents of production may be subdivided into those which are limited, and those which are practically unlimited. This distinction applies principally to natural agents. For labour may in general be regarded as an article of which the supply is limited. The ownership or use of those agents of production which are limited and capable of being appropriated acquires a value in exchange. Hence rent of land and wages of labour take their origin.

To account for the difference in the rents paid for different lands, it has been usual, after RICARDO, to arrange the lands in a sort of scale of fertility: No. 1, No. 2, and so on. Upon this classification it is to be remarked that productivity, the real basis of the differences in question, does not vary according to any one attribute, such as the indestructible powers of the soil, or proximity to the centres of industry; but upon a number of attributes (compare B. PRICE, *Practical Pol. Econ.*, chapter on "Rent"). Moreover a scale in which lands, or other natural agents, were arranged according to their productive power, would hold good only so long as the other factor of production, human action, might remain constant. A light sandy soil may be more productive than a heavy clay, so long as the doses of labour applied to each are small. But the order of fertility may be reversed when the cultivation is higher. As Prof. Sidgwick remarks "these material advantages" [afforded by natural agents] "do not remain

the same in all stages of industrial development: but vary with the varying amounts of labour applied, and the varying efficiency of instruments and processes" (*Pol. Econ.*, bk. i. ch. iv. § 3). Compare Prof. Marshall, *Principles of Economics*, bk. iv. ch. iii. § 4.

A similar difficulty attends the attempt to arrange the other agent of production, human labour, in a scale of excellence; whereby to determinewhat has been called RENT OF ABILITY (*q.v.*). Prof. Macvane has noticed this difficulty in an article on "Business Profits" in the *Quarterly Journal of Economics* (Harvard) for Oct. 1887. Prof. Walker, in a reply to Prof. Macvane in the same journal, April 1888, admits and very happily illustrates the difficulty (p. 227).

[On this subject as many references might be given as there are treatises on political economy. The twofold classification above indicated is illustrated by the following:—HOBBS, *Leviathan*, beginning of ch. xxiv. ("The plenty of matter" consists of "those commodities which from the two breasts of our common mother, land and sea, God usually either freely giveth, or for labour selleth to mankind").—PETTY, *Treatises on Taxes* (3d ed. 1685), ch. viii. p. 57 (labour the father, land the mother, of wealth).—BERKELEY, *Querist*, Query 4. ("Whether the four elements and man's labour therein be not the true source of wealth.")—CANTILLON, *Essay*, pt. i. ch. i. (land the matter and labour the form of riches).—Courcelle-Seneuil *Traité théorique*, bk. i. ch. iii.—Hearn, *Plutology*, ch. ii.]

F. Y. E.

AGIO. An Italian word, the original meaning of which is "ease, convenience." It was introduced into general mercantile language to express the additional sum payable by a person who wished to exchange one kind of money against another kind, the kind taken in exchange being in greater demand than the kind given in exchange; the person effecting the exchange paid the premium for his convenience. The expression when now used is employed in countries where a premium is payable on metallic money, and where paper money with a forced currency is the regular medium of exchange.

E. S.

AGIOTAGE, or AGIO, was a term first used in Venetian finance to denote the difference in exchange between depreciated currency and metal of full value. Such depreciated currency formerly consisted mainly of debased or worn coins, but more recently paper money, whether bank notes or government notes, have afforded illustrations under this head. The banks established at Venice, Hamburg, Genoa, Amsterdam and elsewhere, were bound by law to receive deposits and make payments according to certain standards, and the premiums charged upon such money as compared with the general circulation represented the *agio* payable to the banks in question. These banks were used in making international payments for the

reason "that their standard was a fixed, not a varying quantity, and served greatly to introduce the system of economising coinage by exchanging bills and promises to pay instead of actual metal. See BANKS, EARLY EUROPEAN.

AGNATI (ADGNATI). The members of a Roman family having a common legitimate male ancestor in the male line, either naturally or by fiction of law (adoption or marriage with *in manum conventio*). *Cognati*, on the other hand, are relatives in the modern sense.

E. S.

AGRICULTURAL COMMUNITY. In giving an account of agricultural communities it seems best to follow the plan adopted by Mr. Seeböhm in his standard work on the *English Village Community*, and to proceed from known and undisputed facts, open to present observation, back through historical evidence which step by step decreases in authority and increases in difficulty of interpretation until we arrive at the tribal organisations, clans, and kindred settlements of prehistoric times; that is to say, the comparative method may be first applied to existing communities, and to the traces and survivals of the past, and then an explanation may be attempted by the historical method.

Communities in which land is practically owned and cultivated in a collective manner, according to customary rules of great antiquity, and in which the rights and powers of any individual are strictly limited, still exist over large areas and among vast populations. In Central Asia the tribes of pastoral nomads are made up of groups, each under the authority of the head of a family, and nothing is the subject of separate ownership except clothes and weapons (LE PLAY, *Ouvriers Européens*). When a group becomes too large a division is made by the head in a manner suggestive of the division made between Abraham and Lot.

More interest, however, attaches to the communities which have a settled system of agriculture in a fixed area. The most important at present is the Russian MIR, which may be described as "the aggregation of inhabitants of a village possessing in common the land attached to it." Each male inhabitant of full age is entitled to an equal share of the land. The period of distribution at present varies in different districts, nine years being the average, and the limits from three to fifteen. The arrangements for the partition are decided by the peasants under the presidency of the *stavosta* (headman or mayor). All the arable land is divided into three concentric zones which extend round the village, and these zones are again divided into three fields to admit of the three-field system of cultivation. These fields again are divided into long narrow strips, in length from one to four furlongs, and in breadth from one to two rods. The division of the parcels is arranged so that every man has

at least one parcel in each of the great fields. The bundle of parcels is arranged before the lots are drawn. As a rule there is not much difference in the fertility of the land, but in some cases the measuring rods are of different lengths according to the fertility. Formerly a certain amount of forest, pasture, and meadow was attached to each village, the inhabitants paying a kind of labour rent, but by the Act of Emancipation of 1861 this part of the land was made over to the lord. The cultivation is carried on in a strictly routine manner, the time of sowing, reaping, etc., being fixed by the village assembly, and there being no division between the parcels of land, and no separate approach. The dwelling-house, *izba*, with its enclosed garden ground, is, however, private property, although even in this case the owner cannot sell it to a stranger without the consent of the *mir*, which has always the right of pre-emption. Before the abolition of serfdom the lord of the manor (to give the nearest English equivalent) granted about half the arable land to the *SERFS*, and cultivated the remainder with their forced labour of about three days a week. On the emancipation a rent (redeemable—the money being in many cases advanced by government) was fixed, and a minimum amount of land assigned to each serf. Power was given to the *mir*s by a two-thirds majority to abandon the system of collectivism in favour of individual ownership, but on the whole the *mir* has been rather strengthened, and is taken by the government as the basis of taxation. From the economic standpoint the most striking objections to the *mir*, which also seem to render its long continuance under modern conditions doubtful, are (1) the natural growth of population under the system of equal division. Hitherto this increase has been slow, owing partly to the large mortality of the children, and partly to the women being much older than their husbands, and to the prevalence of immorality. But the infant mortality might readily be lessened, and the system of unequal marriages, which rests on the convenience of the head of the family in obtaining women-servants by the marriage of his boys, seems to be falling into disfavour. (2) The second objection lies in the constraint placed upon individual enterprise by the compulsory cultivation according to fixed methods, in the impossibility of highly extensive cultivation with the periodic divisions of the land, and the absence of enclosures, and in causes similar to those which in England in the 15th century secured the victory of *several* (enclosed, individual) over *champion* (non-enclosed, common) cultivation (compare E. de LAVELEYE, *Primitive Property*, ch. iii. "Economic Results of the Russian Mir").

Next to Russia, India is the most important example of the present existence of village com-

munities, although in the manner described by Sir H. Maine (*Village Communities*, Lect. IV.) their primitive simplicity and essential features were sacrificed for a time at least to alien English and Mohammedan law, the *ZEMINDAR* or official collector of customary taxes having been converted into a kind of manorial proprietor. In recent years, however, the tendency has been to protect these communities, and over large districts to regard them as the agricultural and fiscal unit. The general features—allowance being made for differences in climate—are not unlike those of the Russian *mir* and the early Teutonic settlements described below. There is the division into strips, and the cultivation according to minute customary rules of the arable portion, and there is a certain portion of waste enjoyed as pasture by the different members. The village consists of households, each under a despotic head, the family life being characterised by extraordinary secrecy and isolation. In many communities the customs are declared and interpreted not by a council of elders but by the headman alone, his office being sometimes hereditary and sometimes nominally elective. The various trades or crafts necessary to a self-supporting village are also often hereditary, e.g. the blacksmith, the harness maker, etc.

In Java a system prevails closely analogous to that of India. The village is jointly responsible for the payment of taxes, and there is common use of the waste. The rice fields are periodically divided amongst the village families and the houses and gardens are private property. Irrigation is conducted according to communal rules and plans (cp. De Laveleye, *Primitive Property*, ch. iv.) The *Allmends* of Switzerland furnish another example of common cultivation. These are lands belonging to the communes, the right of use, however, being hereditary in certain families only, and most residents even of long standing and although having political rights, are excluded. The *Allmend* furnishes wood for fire and building, pasture for cattle on the *alp*, and a certain portion of arable land. In some cases there is still periodical division of the land, in others the land is let and the proceeds devoted to the expenses of the commune.

In Scotland, in the crofting parishes, we find as a rule that the tenants have a certain amount of hill ground on which they have the right to pasture so many sheep or cattle, the number varying in different cases according to the holding. As soon as the crops are gathered the ground is thrown open in the same way. There are, however, no periodical divisions, and the village had no rights not derived from the feudal proprietor until the recent legislation giving effect to presumed custom established fixity of tenure at a "fair rent," and made provisions for consolidating holdings.

In England there still survive a number of

COMMONS and LAMMAS-LANDS in which certain members of a village have definite rights, and there are abundant traces of the old agricultural communities. In most of the countries of Europe where private property has become the rule there are also survivals which point to the wide prevalence of customary cultivation in common. On the historical development and gradual decay of the village community, the reader should consult Mr. Seebohm's remarkable work, which, on its broad outlines has been mainly followed in the rest of this article. Although nominally this work is confined to England, the search for a rational explanation led the writer to make a wide survey of many other countries at different times. Before Mr. Seebohm's work appeared many writers had called attention to the wide prevalence of common cultivation in England in recent times. A passage is quoted by Sir Henry Maine (*Village Communities*, p. 90) from Marshall's *Treatise on Landed Property* (1804), in which the writer from personal observation of "provincial practice" attempts to construct a picture of the ancient agricultural state of England. He notices the division of the arable land into three great unenclosed fields adapted for the regular triennial succession of fallow, wheat (or rye), and spring crops (oats, beans, peas, etc.) He describes also the division of these fields into strips and the mode in which the meadows and the waste were used. He gives also statistics on the extent to which in his day these open and common fields existed, which have been summarised by E. NASSE, *The Common Field System for England in the Middle Ages*. Mr. Seebohm points out (p. 14) that taking the whole of England with roughly speaking its 10,000 parishes, nearly 4000 Enclosure Acts were passed between 1760 and 1844, the object of these acts being expressly to get rid of the old common unenclosed fields. But in spite of the Enclosure Acts the old system has left many indelible traces on the surface of the land itself and the nature of the holdings in the size and shape of the fields (compare also Canon Taylor's paper in *Domesday Studies* on "Domesday Survivals"). The open fields were nominally divided into long acre strips a furlong (*i.e.* a furrow-long) in length and four rods in width. Originally these strips were separated by green balks of unploughed turf, and these balks can still be traced. A bundle of these long acre strips a furlong in width made a "shot" (Anglo-Saxon) "quarentena" (Latin) "furlong" (old English), and these furlongs were divided by broader balks generally overgrown with bushes. The roads by which access was obtained to the strips usually lay along the side of the furlong and at the end of the strips, and these roads, often at right angles to one another, still survive. There are further traces on the land itself of the old "head-lands" (Scotch head-

rig), the "linches," "butts," "gored acres" and pieces of "no man's land" (Seebohm, p. 6). Canon Taylor in the paper cited above gives some very remarkable examples of the effects of the same method of ploughing in these open fields having been practised for many generations.

But not only on the surface of the land, but in the present distribution of the fields and "closes" constituting a farm, the effect of its common open fields may be traced. Taking any manor as a centre we find the farms of which it is composed not consisting only of solid blocks (as in the newly-settled land of the United States), but of a number of little fields scattered about in the most "admired disorder," and at a considerable distance from one another. Of the present inconvenience and want of economy involved in the arrangement of farming land there can be no doubt from the modern agricultural standpoint, and if a *tabula rasa* could be made of the land such a wasteful method of distribution would never be adopted. The inference is plain that this irregular straggling scattered ownership and occupation of the land must be a survival from a past custom of which the inner meaning has been lost. The great merit of Mr. Seebohm's work is that he provides a key for the explanation of this peculiarity, and whatever modifications may be found necessary with further research this explanation is certainly at any rate a most valuable working hypothesis. Evidence of the full existence of the open-field system is easily perceived as far back as the 16th, 15th, and 14th centuries. We have the literary remains of the great agricultural controversy, in the two former centuries, on "champion" and "several" already alluded to, and for the 14th century we have the graphic touches of Piers Plowman in describing his "fair felde" full of all sorts of folk. Then through a series of documents such as the *Winslow Manor Rolls* (reign of Edward III.), the *Hundred Rolls* (Edward I.), the records of various abbeyes, the *Boldon Book* (1183 A.D.), we are taken back to the great *Domesday Survey* (1086 A.D.). So far the result of the evidence is certainly to show that the further we go back the more clearly do we discover the wide prevalence of the open-field system and cultivation in common. Up to the time of *Domesday* at any rate, Mr. Seebohm may be admitted to have proved his case, and it will be convenient in this short summary at this point to abandon the retrogressive chronological method and to notice the principal features of the system at the time of the Conquest and the processes and causes of its decay.

At the completion of the Conquest there were certainly manors everywhere, some belonging to the king, others to great barons and prelates, and others to the mesne tenants of these greater lords (cp. Madox, *Exchequer*). Some lords held many manors and were represented by a steward or REEVE (*villicus*). The typical MANOR was a

manorial lord's estate with a village or township upon it under his jurisdiction and held in the peculiar system of serfdom known as villenage.

Passing now to the internal economic constitution of one of these manors and leaving the legal difficulties on one side, we observe that the arable land was divided into the lord's *demesne* and the land in villenage. The whole of the arable land was in three great open fields, and the *demesne* land was interspersed with the villen's land. For the present purpose the *liberi homines* may be omitted, and we may observe that there were three classes of tenants in villenage, namely *villani* (proper), *cotarii* or *bordarii* (cottagers), and *servi* (slaves). The chief interest attaches to the villeins. The typical villen holding was a virgate or yardland, and a VIRGATE normally consists of thirty acres, namely ten of the long-acre strips in each of the three great open fields. It has been calculated (Seeböhm, p. 102) that about 5,000,000 acres were under the plough in the counties named in the survey, about half being held by the villeins.

The normal virgate was an indivisible bundle of strips of land passing with the homestead by regrant from the lord to a single successor. There were also rights to certain use of meadow and waste. The virgates with their homesteads were sometimes called for generations by the family name of the holder. The central idea of the system was to keep up the services of various kinds due to the lord of the manor, and the virgate was a typical family holding. The services consisted of so much WEEK WORK, generally three days, an uncertain quantity of boon-work (*ad precem*, precarious) at the will of the lord, and certain payments, occasionally of money but more frequently in kind. There were also restrictions upon the personal freedom of the villeins, e.g. the lord's licence must be obtained on the marriage of a daughter, or the sale of an ox, etc., and no one could leave the land without the lord's assent.

The normal outfit of the VILLEIN was a pair of oxen, and the ploughing was usually done with a team of eight oxen. Thus even so far as the beasts were concerned the co-operation of at least four villeins was required. We find also that certain craftsmen held their virgates in virtue of their services to the village, and the principal wants of the community were satisfied by its own labour. Everywhere and in everything custom was in force limiting the nature and amount of the services and prescribing the times and methods of cultivation. The principal differences between the English village community at the Conquest and at the time of the Black Death (1349 A.D.) are to be found in the gradual break-up of these overpowering customs and the increasing scope given to individual enterprise and variety. The nature of the

movement is shown by the increasing irregularity of the holdings and the departure from the normal type, by the progressive limitation of the services demanded and above all by the substitution of money payments for these services and payments in kind. This commutation in the mode of rendering tribute to the landowner was the most potent cause of economic progress in the mediæval period. By the time of the BLACK DEATH the option at any rate of money payments had become usual. The landowner found his advantage in the greater efficiency of hired labour, and the villen had the power of benefiting himself by exceptional industry.

For a long time, however, the customary methods of cultivation prevailed, and, as pointed out above, the open fields remained down to the close of last century. The principal point to observe is that starting with the Conquest, economic and agricultural improvement has been closely connected with the disintegration of VILLAGE COMMUNITIES. The nature of this movement is, however, often overlooked, because a comparison is made at different times between different parts of the social scale, the modern farm labourer being compared to the villen with the virgate, to the apparent disadvantage of the former in spite of serfdom. But the true counterpart of the modern labourer was the mediæval slave, and the villen corresponds to the modern small farmer or landowner.

When we go back beyond the Conquest we find strong evidence of the prevalence in the eastern districts of Britain of these village communities in serfdom under manorial lords, though the points of similarity are at first disguised by the difference of language. There seems, however, little doubt that, whatever may have happened at the time of the Saxon invasion and in the dark period which followed after the departure of the Romans, as soon as the Saxons were settled they developed (or adapted) the essential economic features of the manor (compare the Laws of Ine quoted by Mr. Seeböhm, p. 142). It is at this point that the principal controversy arises. The older view generally associated with the name of Von Maurer was that the Saxons imported into this island the fully-developed MARK SYSTEM. The members of the *mark* were freemen, and in their assemblies decided on points of interest to the community. The arable land was divided, and the portions of meadow were allotted by popular vote. According to this view the village community in historical Saxon times had degenerated from this original type, the overlordship of a single individual having taken the place of the free assembly of equals. Against this view, however, Mr. Seeböhm has made out a very strong case. His principal points are that the Saxons in their own homes do not appear to have cultivated land on the THREE-FIELD SYSTEM; that as soon as historical

evidence is available we find the closest analogies between the agricultural systems in Saxon-England and that in the Romano-Teutonic portion of southern Germany; that there is no sufficient time allowed for the full development independently of the manorial from the mark system, and that there is no reason to suppose that the Saxons exterminated the inhabitants and treated the land as if it were virgin forest. The conclusion is that to a great extent the Saxons simply adopted the system which they found already established by the Romans during their four centuries of occupation. This opinion is supported by the close analogy between the conditions of tenure of the Romano-British *colonus* and the later *villani* (Seeböhm, p. 267). Thus the Roman *villa* is made to contribute some of the most important elements of the late English village. But now the question arises:—Whence were the elements of the Roman system in Britain derived? Did the Romans themselves import their own agricultural customs and impose them upon the inhabitants, or did they adapt what they found to their own uses? It is known from other sources that the most usual course of the Romans in their policy of *parcere subjectis* was to amalgamate as far as possible foreign customs with their own. It is known also from historical evidence that before the Roman invasion in many parts of Britain there was a settled system of agriculture, notably in the south-east, and it would be in accordance with their usual practice for the Romans to take what they found as the basis of their own methods of cultivation and extracting revenue from the people. We are thus thrown still further back, in order to discover the elements of this system which existed in Britain before the Roman invasion, and in the search we discover, following the lines of Mr. Seeböhm's investigation, that through the whole period from pre-Roman to modern times there were two parallel systems of rural economy the essential features of which were preserved in spite of the Roman, English, and Norman invasions—namely the *village* community in the east and the *tribal* community in the west of the island. Neither system was introduced into Britain during a historical period of more than 2000 years. The *village* community of the east was connected with a settled system of agriculture; the equality and uniformity of the holdings were signs of serfdom, and this serfdom again had itself arisen from a lower stage of slavery. The *mark* with its equal freemen, so far as this part of Britain is concerned, is thus an untenable hypothesis. We have equality and community, it is true, but they are based not on freedom but on organised serfdom. On the other hand the *TRIBAL SYSTEM* which prevailed in the west of Britain (especially Scotland and Wales) and also in Ireland was connected with

an earlier stage of economic development mainly of a pastoral kind. The tribal community was bound together by the strong ties of blood-relationship between free tribesmen. This free equality involved an equal division amongst the tribesmen according to various tribal rules, and this custom of sub-division has survived to our own day in the "RUN-DALE or "run-rig" system of the west of Scotland and Ireland. In this brief summary many interesting points have been omitted and many certainly require further investigation. The origin of the size and shape of the long-acre strips, the original object of the irregular scattering, and the way in which the system became solidified in such an inconvenient form for modern requirements, can only be alluded to. Perhaps the most remarkable general result is that co-operation which we are accustomed to regard as a purely modern product is very ancient, but whether this co-operation arose, unlike most other ancient institutions, purely from rational elements and from motives of economy and convenience, has not yet been the subject of sufficient investigation. Certainly hitherto the principal danger in re-constructing primitive societies has been to import too readily modern ideas and not to allow sufficiently for what we should now call irrational elements.

L. Gomme, *The Village Community with special reference to the origin and form of its survivals in Great Britain*. London, 1890.] J. S. N.

AGRICULTURAL GANGS. See GANGS.

AGRICULTURAL HOLDINGS ACTS. An Agricultural Holdings Act for England and Wales was passed in 1875, but, not being compulsory, remained inoperative, and was repealed by the act of 1883, which is now in force, and applies to agricultural and pastoral holdings, to market gardens, and to holdings let to tenants in connection with any employments. The principal provisions of this act come under five heads: (a) Compensation for improvements, (b) fixtures, (c) distress, (d) notice to terminate yearly tenancy, (e) resumption of holding by landlord for the purposes of carrying out improvements.

(a) At common law an outgoing tenant is not entitled to compensation for improvements, except under a local custom. It is now provided that every tenant on quitting his holding shall be entitled to compensation for the improvements made at his own expense during his tenancy. The act enumerates three classes of improvements. As regards the first class (comprising the erection of buildings,

laying down of permanent pasture, making of gardens, etc.), compensation cannot be claimed unless the landlord has given his consent to the improvement. As regards the second (drainage), notice must be given to the landlord, who has the option of executing the improvement at his own cost, charging 5 per cent interest. The improvements comprised in the third class (boning, chalking, liming, application of artificial manure, etc.) may be executed without the landlord's consent and without notice to him. The sum payable for compensation is to represent the value of the improvements to an incoming tenant. Any contract made by a tenant, by virtue of which he is deprived of his rights to compensation, is void.

(b) At common law fixtures on agricultural holdings belong to the landlord. The act now provides that engines, machines, fences, or buildings, which the tenant affixes or erects without being obliged to do so, may be removed by an outgoing tenant, unless the landlord (to whom notice must be given) elects to purchase them at a price representing their fair value to an incoming tenant.

(c) In ordinary cases the landlord may distrain for six years' arrears of rent, but in the case of holdings coming under the act the right to distrain is now limited to one year's rent. Some partial and total exemptions from distraint are also created by the act. Live-stock taken in to be fed at a fair price payable by the owner cannot be distrained, if other sufficient distress be found, and cannot in any case be distrained for a sum exceeding the amount remaining due from the owner for the cost of feeding. Hired machinery, and live-stock belonging to another person which is on the premises merely for breeding purposes, are not to be distrained at all.

(d) The usual tenancy from year to year can be terminated at the end of each year by a six-monthly notice, but in the case of a holding coming under the act, one year's notice is now required in the absence of any special arrangement.

(e) The act allows a landlord in the case of a tenancy from year to year to give notice to terminate the tenancy, as to part only, if the land be wanted for labourers' cottages, or gardens, for allotments, for the planting of trees, for mines, quarries, or sand-pits, or for making watercourses or reservoirs, roads, railways, etc. The tenant may, however, within twenty-eight days after receiving the notice, inform the landlord that he accepts it as a notice to quit the entire holding.

An act applying to Scotland was passed in the same year (1883); it contains provisions as to compensation, fixtures, notice, and some matters peculiar to Scots law. As regards Ireland, see IRISH LAND LAW. E. S.

AGRICULTURAL SYSTEMS. ADAM SMITH

uses this term in the title of ch. ix. of bk. iv. of the *Wealth of Nations*, as equivalent to "those systems of political economy which represent the produce of land as either the sole or the principal source of the revenue and wealth of every country." The last part of the chapter deals with the policy of favouring agriculture rather than manufactures and commerce adopted by China and ancient Egypt, Hindostan, Greece, and Rome. This policy Adam Smith treats as an agricultural system, presumably because he thought it to have been inspired by a belief that the produce of land is the "principal" source of wealth. But the chief object of the chapter is to explain and criticise the system of the French "economists" or physiocrats, in which the produce of land is represented as the "sole" source of wealth. For an account of this system see PHYSIOCRATS.

Prof. Oncken maintains in the Introduction to his *Quæsnay*, that Adam Smith has done less than justice to the "sect" of the "economists."

AGRICULTURE IN ENGLAND. The agriculture of the Romans in England, familiar with writers like Columella, and supplying the needs of an advanced civilisation, was superior to that of their barbarous predecessors or successors. During the Roman occupation the land which was owned by individuals was tilled in one of three ways: (1) by slave labour directed by a steward (*villicus*); (2) by tenants at produce rents (*partiarii* or *metayers*); (3) by free farmers at money rents (*liberi coloni*). [See Dickson's *Husbandry of the Ancients*, Coote's *Romans in Britain*, Daubeny's *Lectures on Roman Husbandry*.] It is probable that among the Romans, the Celts, and the Anglo-Saxons, common tillage was practised (on the question whether the Anglo-Saxon communities ever, in this country, owned the land they cultivated, see COMMONS). In one essential point the farming of the Celtic people who preceded the Romans differed from that of the Teutonic settlers by whom they were succeeded. Among the Celts fresh tracts of grass-land were successively taken in by the co-partners, tilled for corn, and then thrown back into pasture. To this primitive form of nomadic farming the name of "wild-field-grass husbandry" has been given (cp. NASSE on *Village Community*, and Marshall's *Agriculture of the Western Counties*). In the common fields of the Anglo-Saxon communities, on the contrary, pasturage and tillage were permanently separated; grass-land always remained pasture; it was never broken up for tillage. This permanent separation of grass-land from tillage appears a retrogression in farming practice. It is the application to England of a system which was better adapted to the drier climate of the country whence the Saxon immigrants came. Among the early Saxons the soil had been tilled by VILLAGE COMMUNITIES. The land held by the association

was divided into two main divisions: (1) round the homesteads lay permanent enclosures held as private property (cp. Tacitus, *suam quisque domum spatio circumdat*); (2) beyond the village lay the common lands of the association. This latter portion consisted of (a) arable fields, sometimes two, generally three, and in later times four, in number; (b) meadowland for hay; (c) rough wild pasture for live stock. Of the three arable fields one was cultivated each year for wheat or rye, another for oats, barley, peas, and beans, and the third lay fallow. Thus each field every third year was fallow. Both the meadow and arable lands were cut into strips and annually allotted to the use of individuals from putting up for hay or from seed-time. Each partner held scattered intermixed parcels in each of the arable fields, so as to equalise the quality of the land, and to give each a share in the different crops cultivated. The farming was regulated by a system of "field constraint," or later by the REEVE of the manorial lord. After the crops were cleared, separate use terminated and common rights recommenced, the cattle and sheep of the community wandering over the fields before the common herdsman or shepherd (for a detailed account of the system see Seeborn's *The English Village Community*). Co-tillage remained a feature of English farming after the Norman Conquest. Up to the close of the 18th century half the soil of England was thus cultivated, and, in 1879, 600 acres at Stogoursey near Bridgwater were farmed on this system (for the theories respecting the changes effected at the Conquest, see COMMONS). By the close of the 11th century, the immediate lordship of the soil was vested in lords of manors, subject to regulated rights of user enjoyed by the co-operative farmers. The manorial estate was divided into three parts, the DEMESNE, the tenemental land of the associated farmers, and the lord's wastes, over which the live stock of the tenants grazed. The soil was tilled by serfs, by freemen, and by semi-servile tenants, who paid for their land by military or agricultural services. Out of these grades in the rural population sprang the freeholder, the copyholder, and the free wage-earning labourer. The most striking features in mediæval farming were the violent alternations from perpetual cropping to barrenness, from indolence to intense labour, from famine to feasting. Scarcely anything was grown for markets; nearly all the produce was consumed at home by the producers. Arable land exceeded grass-land. No manure was employed; horses were scarcely ever used; oxen were more economical; their food, harness, and shoes were cheaper; when dead they were meat for man. The crops were wheat, oats, barley, rye, beans, peas, flax, and hemp. Rye was the chief grain crop. Roots, artificial grasses, and potatoes were unknown. There was little or no winter keep for live stock; consequently cattle

were killed at Michaelmas, after having been well nourished by the aftermath of the meadows, or the stubble and haulm of the arable land, and salted for winter provision. Wheaten bread was a luxury of the richest. The monks were the only pioneers of good farming. In the change from mediæval to modern farming two great epochs must be noted—(A) the Tudor period; (B) the latter part of the 18th century.

(A) The BLACK DEATH, 1348-49-61, is said to have destroyed half the population of the country (see Hecker's *Epidemics of the Middle Ages*; Rogers's *Hist. of Prices*, vol. i.; Jessop, *Coming of the Friars, and other Essays*). The mortality resulting raised the rate of wages 50 per cent. The attempts of manorial lords to fix rates of wages by statute (25 Ed. III.) or to resume personal services, caused the PEASANT REVOLT of 1381. This proves that by 1350 the relations of occupiers and owners had settled down into more modern conditions, that tenant-farmers, copyholders, and free wage-earning labourers had replaced the serfs and villeins, that leases had become common, that the customary services of the peasantry were first rendered certain and then commuted for money rents or money wages (see Denton's *England in the Fourteenth Century*, and Ashley's *Economic History*). The effects of the Black Death were social rather than agricultural, and as such will be noted elsewhere. With the close of the Wars of the Roses and the commencement of the 15th century, begins the era of farming for profit which characterises the Tudor period. Feudalism was extinct; commerce progressed; the wool trade flourished; landlords required money, not retainers. Two great changes were introduced: (1) individual for common occupation; (2) the conversion of arable land into pasture. (1) Lords of manors withdrew from the agrarian associations and enclosed their demesnes and wastes; common-field farmers were encouraged to extinguish their reciprocal common rights, and exchange solid tenements for their scattered strips. (2) Arable land was converted into pasture, farms were consolidated, farm-buildings destroyed, and England became a sheep-producing country. The increase of enclosures and decrease of tillage, combined with the dissolution of the monasteries and the absorption of church lands into the estates of adjoining landlords, inflicted serious losses on thousands of cottagers, common-field farmers, and labourers, and produced the widespread social discontent of the Tudor period. It is the first step in the separation of the peasantry from their interest in land and the extinction of the YEOMEN class. Towards the end of the reign of Elizabeth the balance of social relations began to recover its equilibrium. The 17th century was a period of theoretical progress, practically interrupted by civil disturbances. The improvement is shown in (1) the rise of agricultural literature,

beginning with FITZHERBERT and TUSSEY; (2) the introduction of new crops—hops (Reginald Scot's *A Perfitte Platform of a Hoppe-Garden*, 1574), potatoes (J. Foster's *English Happiness*, 1664), turnips (Sir R. Weston's *Discourse of Husbandry*, 1650), artificial grasses (HARTLIB'S *Legacie*, 1652); (3) improved methods of cultivation—Gabriel Plattes advocated drill-sowing; Vaughan (*Water Workes*, 1610) urged irrigation; Blith (*The English Improver*, 1649) studied drainage as a science; (4) increased attention to live stock—(Mascall's *Government of Cattell*, 1605); (5) removal of feudal abuses (stat. 12 Car. II.); (6) increased enclosures (Joshua Lee's *Eutaxia tou Agrou*, 1656).

(B) The work of the 18th century may be summed up in the practical application, diffusion, and extension of these improvements through the work of men like Tull, Townshend, Bakewell, Arthur YOUNG, and Coke of Holkham. Tull was a man of scientific turn, who invented several improvements in implements and was the exponent of drill-husbandry. "Turnip" Townshend introduced into Norfolk turnips and artificial grasses. The alternations of these crops with cereals enabled farmers to observe what, in the absence of chemical manures, was the golden rule of not taking two corn-crops in succession, largely diminished the area of fallows, assisted them to carry more live stock and feed it in the winter, increased their command of manure, and consolidated the light sandy soils of the eastern counties. Bakewell was the founder of the grazier's art. He was the first scientific breeder of sheep and cattle; and the methods he adopted with his Leicester sheep and Leicester longhorns were applied throughout the country by other breeders to other breeds. As population advanced, sheep and cattle were valued more for their carcases than for their fleece or their powers of draught. So long as the common-field system prevailed, Townshend's or Bakewell's improvements were impossible. England, excluded from foreign markets by wars and commercial policy, was compelled to supply the needs of vast manufacturing centres from her native resources. The common-field system, only adapted to meet the wants of producers, was obsolete. Arthur Young was the theoretical, Coke of Holkham the practical, exponent of the new system of large farms and capitalist farmers. Landlords put themselves at the head of the movement, expended money in buildings, granted long leases. New roads and canals opened out new means of communication. Agricultural societies and shows were multiplied; surveys of the country were made by Young, MARSHALL, and the Board of Agriculture, which was constituted in 1793 (see BOARD OF AGRICULTURE). Between 1760 and 1820 more than 6,000,000 acres of land were enclosed. The change produced a new agricultural and social crisis more

severe than that of the Tudor period. The century closed with the miseries which resulted from enclosures, consolidation of holdings, and the reduction of thousands of small farmers to the ranks of wage-dependent labourers. The result of the crisis was to consolidate large estates, extinguish the yeomanry and the peasant proprietary, and to sever the connection of the labourer from the soil. The subsequent history of agriculture may be summed up in the application of science to practice under the conditions of land-tenure, with which we are now familiar. Vast capital has been expended on farm-buildings and drainage; machinery and steam have lessened the cost of production; the farmer's resources of crops, winter food, manures, and implements are indefinitely increased; new means of transport have opened new markets in every direction; mechanics, capitalists, architects, geologists, chemists, physiologists, botanists, statisticians, are now enlisted on the side of the farmer. Smith of Deanston (1834) and Josiah Parkes (1843) applied their practical and scientific knowledge to drainage; Reed's cylindrical pipes (1843), Serogg's machine (1843) for their construction, and the facilities provided by parliament for raising loans for land improvement (1846) enabled landlords to profit by improved science and new appliances. New manures were discovered. Nitrate of soda (1835), Lawes's superphosphates of bone dust (1843), Henslow's superphosphates from coprolites (1843), Odam's ammoniacal manures (1851), revolutionised the old rules of cropping. Inventions in agricultural implements of every description were rapidly produced. New crops such as swedes, field cabbages, kohlrabi, mangel-wurzel, etc., were introduced. More live stock is kept, and it is better bred, better fed, and more rapidly brought to maturity. Intelligence is more widely diffused both among landlords and farmers. Agricultural statistics supply new and valuable information and record the results of striking experiments. The constitution of the Royal Agricultural Society in 1838, in place of the old Board of Agriculture which expired in 1819, marked the return of prosperity after the disastrous interval from 1795 to 1835. Many legislative improvements were effected, such as the new POOR LAWS, the Commutation of TITHES, the General ENCLOSURES Act, the Enfranchisement of Copyholds, the SETTLED LAND Act, the AGRICULTURAL HOLDINGS ACTS. Recently also (1889) the BOARD OF AGRICULTURE (*q.v.*) has been re-established. But in the last fifteen years agriculture has ceased to progress, even if it has not retrograded, owing to the agricultural depression of 1873-89 (see DEPRESSION, TRADE AND AGRICULTURE).

[Besides the books mentioned in the text the student is referred to the following works: (1) Professor Rogers's *Agriculture and Prices*; (2)

Professor Rogers's *Six Centuries of Work and Wages*, both which contain an immense amount of valuable information; (3) Prothero's *Pioneers and Progress of English Farming*, which is intended to meet the want of a short history of agricultural progress, especially in the 18th and 19th centuries; (4) and the following original authorities—Arthur Young's *Tours of the English Counties* (Southern, 1768, 1 vol.), Northern (1770, 4 vols.), Eastern (1771, 4 vols.),—and *Tour in Ireland* (1776-79);—Marshall's *Rural Economy of the English Counties and Scotland* (1787-98, 14 vols.);—*Reports of the Board of Agriculture*, 1793-1815;—*Reports of the Royal Commissions on Agriculture*, 1820, '21, '22, '33, '36, '37, and '79-81;—Pusey's *Parliamentary Committee on Agricultural Customs*, 1848;—Sir James Caird's letters to the *Times* as *Times* commissioner in 1850-51;—*Landed Interest*, 4th ed., 1880; and the letters of the commissioner of the *Morning Chronicle* in 1850;—the *Parliamentary Inquiry into Land Improvements*, 1873;—*Report of the Central Chamber of Agriculture on Agricultural Customs*, 1874;—and the *Agricultural Returns* annually published since 1864.]

R. E. F.

AICKIN, REV. JOSEPH, author of *Mysteries of the Counterfeiting of the Coin of the Nation* . . . (London, 1696). As a method of "preventing the said abuse for ever," it is proposed that a licence should be required for all occupations in which the materials or implements employed in counterfeiting coin are made, sold, or used.

F. Y. E.

AID, AUXILIUM. A tax, which might be assessed, while the feudal system prevailed, on the knight's fee on three occasions: (1) when the king made his eldest son a knight; (2) when the king gave his eldest daughter in marriage; (3) if the king were made captive, to ransom his person (Dowell, *History of Taxation in England*, vol. i. p. 21). Used also in same sense as SUBSIDY (*q.v.*)

AID, RATE IN. See LOCAL TAXATION.

AIDES, COUR DES. The *aides*, or indirect taxes on commodities, were first imposed in France by the States-general in 1355. Instead of entrusting their administration to the existing financial court, the *chambre des comptes* (see COMPTES, CHAMBRE DES), a new body was created called the *cour des aides*. Before long its functions became almost solely judicial, the decision of disputes arising about the GABELLE on salt and other indirect taxes. Its jurisdiction was curtailed by the usurpations of the *conseil du roy*, and was frequently disputed by the rival *chambre des comptes*. It continued to exist as one of five *cours souveraines* till it was swept away with the other institutions of monarchical France by the Revolution.

[Gasquet, *Précis des Institutions politiques et sociales de l'ancienne France*.]

R. L.

AICKIN, JOHN, M.D. (1747-1822) brother of Mrs. Barbauld and author of *General Biography*, *Works of the British Poets*, etc., editor of *Dodgley's Annual Register* (1811-15), the *Athenæum*,

etc., published in 1795 his *Description of the Country from 30 to 40 miles round Manchester*, giving details of commerce, manufactures, population, in addition to physical features, history, and biography of leading men—a work still valuable for the history of the INDUSTRIAL REVOLUTION (*q.v.*)

J. B.

ASLABIE, JOHN, born December 1670, sat as M.P. for Ripon 1695-1702, then for Northallerton, and for Ripon again from 1705 to his expulsion. He was chancellor of the exchequer in the Sunderland ministry in 1718, and supported the South Sea scheme for paying off the national debt. When the bubble broke in 1720, a secret Committee investigated his connection with the company and he was expelled the House of Commons. He died in 1742. He wrote:

Speech upon his Defence in the House of Lords against the Bill for raising Money upon the Estates of the South Sea Directors, London, 1721, 4to (three editions; also in Dutch).—*Second Speech*, London, 1721, 4to.—*Memorial of the Contractants with Mr. Aislalie in a Letter to Licinius Stolo*, London, 1721, 8vo.

H. R. T.

ALBA FIRMA. The term applied to rents reserved by the crown in silver, or white money, as opposed to rents reserved and payable in kind. 2 Coke's *Institutes*, 19. J. E. C. M.

ALCAVALA. A tax formerly charged in Spain and its colonies on all sales of property. The name, of Moorish origin, had existed from very early times; we possess documents of the 12th and 13th centuries in which it occurs; but it appears to have been then applied to a species of seigniorial due, or, perhaps, sometimes to a tax levied to meet a special emergency and confined to certain places. Alfonso XI., 1342, imposed it on the whole of Castile and Leon, his object being to procure money for the war with the Moors. At first only temporary, the cortes of Burgos, 1377, granted it to Henry II. without limitation of time. It was a duty, originally of 10, afterwards of 14 per cent on the selling price of every sort of property, whether movable or immovable, chargeable as often as the property was sold. In Adam SMITH's time it had been reduced to 6 per cent. It continued to exist down to the invasion of Spain by Napoleon, except in Catalonia and Arragon, those provinces having purchased exemption from Philip V. It violated the fourth of Smith's canons of taxation, taking and keeping out of the pockets of the people more than it brought into the treasury of the state. It was, besides, a great annoyance to manufacturers, merchants, and shopkeepers who, for the purpose of its collection, were subjected to the continual surveillance of the tax-gatherers. USTARIZ attributes to it the ruin of the manufactures of Spain; he might, says Smith, have imputed to it also the decline of agriculture, as it was imposed not only on manufactures, but on the rude produce of the land.

[Colmeiro, *Historia de la Economía Política en España*, vol. ii. p. 550; Smith, *Wealth of Nations*, bk. v. ch. ii.] J. K. I.

ALCOCK, REV. THOMAS, was born in 1709, and died in 1798. He graduated M.A. at Oxford (Brasenose Coll.) in 1741. He was presented to the vicarage of Runcorn in Cheshire, and printed some small pieces, besides the following ably written pamphlets:—*Observations on the Defects of the Poor Laws, and on the causes and consequences of the great increase and burden of the Poor*, London, 1752, 8vo (an attack upon compulsory provision).—*Remarks on two Bills for the Better Maintenance of the Poor*, London, 1752, 8vo.—*Observations on that part of a late Act of Parliament which lays an Additional Duty on Cyder and Perry*, Plymouth, 1764, 8vo. (The duty of 4s. per hhd. on cider imposed in 1763 was repealed in 1766.) H. R. T.

ALEATORY (derived from the Latin *alea*, a die) means uncertain, risky. The more uncertain any prospective advantage appears, the less *ceteris paribus* will be given for the chance of obtaining it. In other words a greater risk must be compensated by a prospect of greater gain, the purchase-money being the same. Thus £100 stock bearing a fixed interest, say £3 per cent, will fetch a lower price the less safe the security is. A person investing a certain sum of money, say £100, will expect a higher interest according as the investment is more speculative. It must not be supposed that the diminution of value due to uncertainty admits of being determined by any actuarial calculation of probabilities. For the depreciation depends not so much on the real uncertainty as on the purchasers' estimate of the risk. On the one hand, as Prof. Sidgwick points out (*Principles of Political Economy*, bk. ii. ch. vi. § 2), "ignorant, rash, and credulous persons investing in novel undertakings are believed to get, on the average, considerably less interest than if they had lent their capital on perfectly good security." On the other hand "there may be and often is something to be allowed as a charge on account of uncertainty" . . . considered as "an evil in itself." . . . A railway stock that is certain to pay 4 per cent will sell for a higher price than one which is equally likely to pay 1 or 7 per cent, or any intermediate amount" (Prof. Marshall, *Principles of Economics*, bk. vi. ch. vi. § 5). Similar principles apply to the influence of risk upon the remuneration of different occupations. Adam Smith's remarks upon the "natural confidence which every man has more or less not only in his own abilities, but in his own good fortune" (*Wealth of Nations*, bk. i. ch. x.), do not require to be quoted. Prof. Marshall thinks that "in the large majority of cases the influence of risk is in the opposite direction" (*loc. cit.*), tending to increase the remuneration by an amount greater than the insurance against risk.

For a fuller discussion see PROBABILITY and RISK AS AN ELEMENT OF COST OF PRODUCTION.

F. Y. E.

ALE-TASTER. This was the title of an officer formerly appointed under the ASSIZE OF BREAD and ale (1267) to inspect the quality and regulate the sale of those commodities in every borough and manor. In some parts of England the office still survives, but its functions have become purely formal. R. L.

ALGAROTTI, FRANCIS, born at Venice 1712, died at Pisa 1764. He was learned and very witty, and owes his reputation to his literary merits and his long personal intercourse and friendship with Frederick II. of Prussia, who ordered a monument to be erected at Pisa to his memory with the epitaph:

ALGAROTTO. OVIDII. AEMULO
NEWTONI. DISCIPULO
FRIDERICUS. MAGNUS

He was a great admirer of English science, English literature, and English political institutions. As an economist he wrote but little—*An Essay on Commerce* and a short pamphlet on the advantages of developing Africa commercially rather than Asia or America. This little tract contained an idea which was utilised thirty years later by the AFRICAN COMPANY, directed by Sir Joseph Banks, at whose expense the famous traveller Mungo Park undertook his expedition. M. P.

ALIENI JURIS. Persons are *alieni juris* if they are not fully capable of binding themselves by contract or to alienate property, alienable in itself, e.g. infants and married women. They are opposed to persons *sui juris*. E. S.

ALIENS. The subjects or citizens of a foreign state. The disabilities of aliens have in England been almost entirely removed. Up to the year 1870, aliens were unable to acquire any land either by descent or purchase, and even natural-born subjects could not make a title to land by descent from alien ancestors. The only disqualification which still remains, as regards the ownership of property, arises from the rule of law that no alien may be owner or part owner of a British ship.

An alien *enemy*, though he can make a valid contract in England, has, during the continuance of the war, no right to enforce it by action, and if the war lasts long enough his claim may thus be barred by the Statute of LIMITATION. An alien cannot be a member of either house of parliament, and has no parliamentary vote; on the other hand he has the privilege of serving on juries if he has resided in England or Wales for upwards of ten years. An alien involved in civil or criminal litigation in England was up to the year 1870 entitled to a jury "de medietate linguæ"—i.e. a jury one half of which was composed of foreign subjects.

An alien may become a British subject by naturalisation, either by special act of parlia-

ment or by a certificate of the Secretary of State. The law as to NATURALISATION is at present regulated by the acts of 1870 and 1872, the effect of which is to confer on naturalised foreigners all the rights and privileges of a British-born subject. A candidate for naturalisation must have resided in the United Kingdom or served under the crown for at least five years, and must declare his intention to establish his permanent residence in the United Kingdom or to take service under the crown. He must also swear the oath of allegiance.

E. S.

ALISON, SIR ARCHIBALD, first baronet, son of Rev. A. Alison (born 1792, died 1867), was educated at Edinburgh University. A paper written by him in reply to MALTHUS determined his profession as a lawyer. Alison was called to the Scottish bar December 1814, and appointed advocate-depute in 1822. He travelled on the Continent, wrote much in *Blackwood*, was made Sheriff of Lanarkshire in 1834, and published his voluminous *History of Europe* (1789-1852), full of economical reflections, some biographies, an autobiography, and other works. The Act restricting the paper currency, the Reform of 1832, and the abolition of the corn laws were his special abominations. Few, if any, writers have insisted with more vehemence on the advantages of an increased production of the precious metals than Alison (*History of Europe*, ch. i. §§ 33-40, 1851-52). It was to the decrease in the supply of gold and silver and to the shrinkage in the circulatory medium thus caused, that he ascribes the decline and fall of the Roman Empire. Hence it was natural that Alison should entirely approve of the SUSPENSION OF SPECIE PAYMENTS in this country carried out in 1797, and the substitution of a paper currency during the severe struggle of the early years of this century (see Walker, *Money*, pp. 81-83, 349, 350, New York, 1883). He wrote:

The Principles of Population and their Connection with Human Happiness, Edinburgh, 1840, 2 vols. 8vo (dull and wordy; the relations between population and subsistence are elaborately set forth).—*Free Trade and Protection, being a Tract on the Necessity of Agricultural Protection*, Edinburgh, 1844, 8vo.—*England in 1815 and 1845, or a Sufficient and Contracted Currency*, Edinburgh, 1845 (4th ed. 1847).—*Free Trade and a Fettered Currency*, Edinburgh, 1847, 8vo.—*Essays*, Edinburgh, 1850, 3 vols. 8vo (many economical).

H. R. T.

ALISON, WILLIAM PULTENEY, M.D., professor of the practice of medicine in Edinburgh, brother of the historian, is best known by his *Observations on the Management of the Poor in Scotland*, 1840 (see Carlyle's *Past and Present*), and his *Remarks on the Report of the Commissioners on the Poor Laws of Scotland*, 1844. He gives extracts from the evidence, drawing special attention to the unemployed. In opposi-

tion to T. CHALMERS, and indeed to the Report itself, he pleads for an extension of legal relief. He wrote a dissertation on the *Reclamation of Waste Lands* (1850), in which he suggests this as a proper field of employment for convicts and paupers.

J. B.

ALLMEND. See AGRICULTURAL COMMUNITY.

ALLONGE. A slip of paper fastened to a bill of exchange to receive indorsements for which there is not space on the bill itself; "as a protection against fraud, and in compliance with the provisions of some of the foreign codes, the first of the indorsements in connection with it is sometimes so made that it begins on the bill and ends on the allonge. There is no legal limit to the number of indorsements."

[Hutchison, *The Practice of Banking*, vol. i. p. 188.]

ALLOTMENT. A small portion of land cultivated by a labourer or artisan in his leisure hours. There is ample evidence to show that previous to the Tudor period the labourer and the artisan had usually a piece of ground attached to their homes. A series of economic changes and the policy of the land system gradually resulted in the separation of the labourers from the soil (see Cliffe LESLIE's *Land Systems of Ireland, England, and the Continent*, London, 1871; NASSE's *Land Community of the Middle Ages*, London, 1871; ROGERS' *Six Centuries of Work and Wages*, London, 1884). An attempt to check this movement was made by the 31 Eliz. c. 7, which prohibited the building of any cottage without an allotment of four acres. The inclosure acts of the 18th century deprived many labourers of their land, though the advantages of allotments were recognised, in 1795, by a select committee of the House of Commons. The Select Vestry Act, 1819, empowered the churchwardens and overseers of a parish to let land to industrious inhabitants and the 1 & 2 Will. IV. c. 42; 1 & 2 Will. IV. c. 59; and 2 Will. IV. c. 42 contained similar provisions. The Allotments Committee of the House of Commons in 1843 recognised the importance of allotments, but the Women's and Children's employment committee of 1868 reported that but sparing use had been made of the facilities granted by the legislature. The total number of separate detached allotments under one acre existing in 1890 was 455,005. The number of other small holdings up to 50 acres was 409,422 (see *Return of Allotments and Small Holdings*, 1890, c. 6144).

In 1887 an act (50 & 51 Vict. c. 48) was passed which empowers a sanitary authority on the petition of six ratepayers to purchase land for allotments not exceeding one acre each. If the land cannot be obtained by agreement, the county council may authorise its being taken compulsorily, the price being determined by arbitration. All the conditions of tenancy are to be

fixed by the local authority, but no buildings save those mentioned in the act can be erected on the land. On the economic advantage of allotments see in addition to the authorities above quoted, *Report of the Poor Law Commissioners*, 1834 ; *English Land and English Landlords*, by G. C. Brodrick (London, 1881). As to small holdings, see Report of Select Committee H. of C., 1890.

[J. S. Mill objects, *Principles of Political Economy*, bk. ii. ch. xii. § 4, to the allotment system. For account of the law previous to 1886, see *The Law of Allotments*, by T. H. Hall (London, 1886).]

J. E. C. M.

ALLOWANCE (TARE, or difference between GROSS and NET). A commercial term signifying the deduction made from the gross weight of the goods, either to represent the weight of the package or refuse, or a particular deduction established by custom of certain trades, districts, or countries. *Tare* has been more especially described as the allowance for the weight of the box or package, or the cart or waggon in which the goods are conveyed ; and *tret* as an allowance for waste, but the former is the word more generally in use ; and gross weight and net weight, live weight and dead weight, and *allowance* in converting from one to the other, are business terms commonly understood. One instance of *allowance* will suffice. The coal merchant receives from the colliery 21 cwt. of coal from the pit for every ton purchased by him, while he sells to the consumer but 20 cwt. The difference is the allowance, or tare, to cover waste in transhipment, cartage, and screening. In many other industries similar allowances are made.

ALLOWANCE SYSTEM. The allowance system was a conspicuous feature in the administration of the poor law at the very end of the last and beginning of the present century. It was a form of out-door relief (see POOR LAW), and may be defined as relief given to those employed by individuals at the average wages of a district. It was thus, in effect, an attempt on the part of the state to regulate wages, and its history gives an illustration of the results which political economy leads us to expect from such interference. It is not too much to say that in the brief space of forty years, the allowance system sent large areas of land out of cultivation, forced capital into less profitable employments, and caused a demoralisation from which the labourers in some rural districts have not yet recovered. The very class which it was designed to benefit has suffered most from its action.

It originated with the administrative authority, viz. the justices of the peace. These derived or assumed their powers under 5 Eliz. c. 4, which authorised them to fix wages, taken in connection with 3 & 4 W. and M. c. 11, and 9 Geo. I. c. 7, which empowered them to order and direct relief. The system in practice dates

from 6th May 1795, when the Berkshire justices resolved to make up by relief from the rates the difference between actual wages and what, in their judgment, was a minimum or "fair" rate for the county. In fixing this last, the price of bread and the size of the family were to be taken into account, e.g. when bread was at 1s. 8d. the gallon, a single man was to receive in all 4s. 6d., a man and wife 6s. 8d., man, wife and five children 17s. 6d. This resolution is often called the "Speenhamland Act," from the place of meeting of the justices, and the scale drawn up for Berkshire was used as a model by most of the southern counties. It may be doubted how far such action was even legal, as, by 9 Geo. I. c. 7, relief had been prohibited to those who refused to accept it in a workhouse ; but it was supported by public opinion, and confirmed in principle the next year by 36 Geo. III. c. 23, which repealed the prohibitory clauses of 9 Geo. I. c. 7, and empowered justices to order relief to any industrious poor person at his own house or home.

The effects of the system were soon seen. Within forty years of the passing of 36 Geo. III. c. 23 it seemed probable that rents would cease altogether to be paid, and in one parish, Cholesbury, Bucks, the rates had actually swallowed up the rental. Where the leasehold system threw the burden temporarily on the occupier, no solvent tenants were forthcoming owing to uncertainty as to the amount which they might be called upon to pay, for in some cases the rates increased threefold in twenty years. In several counties (e.g. Kent, Cambridgeshire, Leicestershire) rent was gradually but surely disappearing.

It might seem, at first sight, as if profits would be raised by a system which forced non-employers to contribute to the wages of labour. But in agriculture any such advantage was more than counterbalanced by an increase in the cost of labour, due to its diminished efficiency. The motive to industry being removed when the reward of the labourer no longer depended on his exertions, industry itself disappeared. In manufactures, on the other hand, where piece-work was generally adopted, a closer supervision exercised, and a larger proportion of non-employers liable to the poor-rate, the system increased profits largely.

Both in agriculture and in manufactures the wages of labour were lowered, partly by the great diminution of efficiency, partly by the increase of population which was stimulated under a system which placed the married man with a family in a better position than the single man, and the mother of illegitimate children than the honest woman, partly, again, because employers were deterred from employing non-paupers by the consideration that they were thus reducing their neighbours' labour bill. More important still was the moral effect of the

system upon the labourers. Industry and prudential foresight were extinguished when the possession of property was a bar to employment, and the position of the thriftless was made an object of envy to the careful: parental responsibility, filial obligation and affection were discouraged; drunkenness, vice, and crime grew apace; and the deterioration of a large part of the labouring population in the districts in which the system was adopted became matter of common knowledge. Had it continued in force but a few years longer the whole social fabric must have crumbled away. The relations between employer and employed were embittered to an extent which showed itself in constant riots; in the southern counties the labourers established a reign of terror. Meanwhile the production of wealth fell off as the rates rose, population grew apace, and civilisation went backwards.

Allowances in aid of wages were gradually abolished as regards men, by the orders of the poor-law board restricting or prohibiting outdoor relief to the able-bodied. It may, however, be questioned whether the same results are not now produced in the case of women by a loose administration of the law.

[For a full account of the allowance system, see Poor-Law Commissioners' First Report, 1834 (reprinted by order of House of Commons, 1885).—Nicholls, *Hist. of the English Poor Law*.—Eden's *State of the Poor*.—Fowle, *The Poor Law* (Macmillan; English Citizen Series).] L. R. P.

[The following statement, taken from the obituary notice of the Rev. Henry Playsted Jeston, late perpetual curate of Cholesbury, Bucks, in the *Guardian* newspaper of 3d July 1889, gives a vivid picture of the effects of the allowance system under the old poor laws.

"In 1830 the parish (Cholesbury), under the old poor law, was on the verge of bankruptcy. In 1831, out of 98 who had a settlement in the parish (the total population being then 127, and in 1881 being 99), there were no less than 64 in receipt of relief, and the poor-rates alone exceeded 24s. in the pound. As the result, the glebe, as well as all the land in the parish save some sixteen acres, was thrown out of cultivation, and the parish had to exist for some time by means of rates in aid levied on other parishes in the hundred. This state of affairs, together with a series of letters which Mr. Jeston wrote to the *Times*, and his evidence before the poor-law commission, had a considerable share in bringing on the present poor law. Before his death Mr. Jeston saw his parishioners in a fairly prosperous condition, not one of them being in receipt of relief from the rates."]

ALLOY. With regard to the derivation of the word "alloy" it may be sufficient to point out that the old French *alei* was retained in the Norman as *alai* or *allai*, whence our word "alloy." Through the erroneous fancy that the French *alei* was equivalent to *à loi* (to law), the word meaning originally simple "combination union" came to be used specially of the

mixing baser metal with gold and silver in coin so as to bring it to the recognised standard, and hence of the standard itself. The French word comes from *alleium* or *alaium*, the original being probably *adligo* (*allego*), to bind to.

The meaning of the word alloy in mint language is different from that ordinarily accepted in scientific phraseology, as it is applied to the base metal added to a more precious one, and not to the mass—which may be either molten or solidified—of the mixed metals.

The reasons for the use of alloys for the coinage in preference to pure metals are somewhat complex, and many conditions have to be taken into consideration in choosing the base metal to be added to the precious metal. The resulting alloy must be of good colour, must be ductile, and must not exhibit any traces of brittleness. In the case of gold, silver forms a very ductile alloy, but then it sensibly lowers the colour of the gold. Copper, on the other hand, heightens the tint and has the advantage of yielding a durable as well as ductile alloy. A triple alloy of gold, silver, and copper may be made of delicate tints, but a triple alloy is difficult to assay, and it is undesirable to complicate the accounts of a mint by the use of two precious metals and a base one in the same alloy, therefore a single base metal—copper—is almost universally used.

It has long been known that the union of two or more metals produces a result which often differs more in physical properties from either of its constituents than these do from each other. Copper and tin, for instance, yield alloys of a wide range of properties, and there is hardly any fact more remarkable in the whole range of metallurgy than the enormous influence exerted on a large mass of metal by a small quantity of another metal as metalloid.

The properties which are found the most desirable to be secured are:—(1) ductility; (2) durability; (3) uniformity of composition.

The alloys actually used for coinage at the present time are not numerous, but looking back over the numismatic history of the world, endless combinations of the precious and base metals will be found to have been used. Pure gold and silver have been used, either singly or alloyed with each other, or alloyed with copper, the latter metal in turn being sometimes employed with only infinitesimal additions of precious metal.

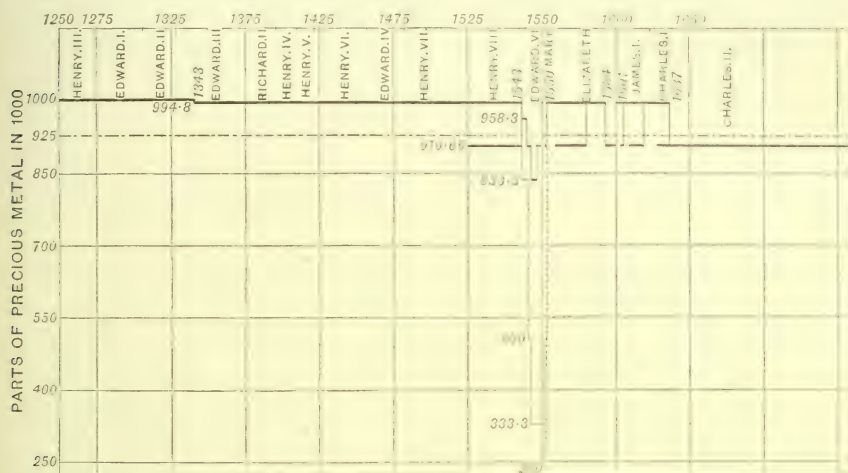

In the case of both the gold and silver currency of this country the adjustment of the relative proportions of the precious and the base metals was undoubtedly guided by the particular systems of weights used. To take the silver coinage first, the fineness of alloys of this metal has from very early times been computed by divisions of the troy POUND, which weight is still retained in weighing

gold and silver. The computation of the standard fineness for alloys of gold is based on the singular "carat" system of weights, the origin of which is popularly believed to have been derived from the weight of an oriental plant seed. It appears more probable, however, that it came from the "*Keration*," a small Greek weight (see also PERIOT).

The standard of fineness of the alloy used at the present time for the British gold coinage is 22 carats, or 916.66 parts in 1000 of pure gold; that for the silver coinage is 925 parts pure silver.

The accompanying table shows the variations in the standard of fineness from the reign of

Henry III. to the present time. The coins in circulation in France from the beginning of the 17th to the end of the 18th century varied in fineness from 900 to 982, when, however, the decimal system of weights and measures was fairly established, coins were issued in conformity with it. The law of the 28th Thermidor, an. iii. (1796), enacted that the standard fineness of the silver coins should be 900, and eight years later a law prescribed the coinage of gold pieces of twenty francs, the standard of which was also 900. A subsequent law lowered the standard fineness of silver coins to 835. By the Monetary Convention of 1865 concluded between France,

Belgium, Italy, and Switzerland these standards of fineness were adhered to, and several other countries have adopted the same monetary system. In Germany the standard fineness of both gold and silver has been fixed at 900, and the same standard has been adopted in the United States for both metals.

It will be evident, from the table as well as from the foregoing remarks, that the two really important alloys used for the coinage of gold have respectively the standard fineness of 916.6 and 900, while the standard 900 is now more widely used than any other, England alone employing 925, which still maintains the connection with Saxon coins. C. R. A.

ALOD, ALODIAL LAND. When the German tribes overran Europe in the 5th century, they distributed among themselves the conquered lands. In England, owing to the displacement of the conquered population, this distribution was probably more complete than elsewhere. Each township or village received an allotment of land, the surplus being the *FOLKLAND*, or property of the tribe. Within the village a further distribution took place among the free heads of households, each of

whom had a homestead as private property, while the arable and pasture land remained for some time in common occupation, being annually distributed for the harvest, whether of hay or corn. Land which was held in separate ownership was called *ethel* or *alod*. The derivation of the latter word is disputed, but it is probably connected with *lot*, and thus expresses the original method of distribution. In the 11th century we find the term applied in England to all land held independently, without rent or service to a superior. It thus included both the original *ethel*, and also *BOCLAND*, or private estates carved out of the *folkland* for the benefit of individuals. After the Norman Conquest alodial land ceased to exist, owing to the general introduction of feudal or conditional tenure.

[See Stubbs, *Constitutional History*, vol. i. ch. v.—Kemble, *Saxons in England*.—Freeman, *Norman Conquest*, vol. i.] R. L.

ALTERNATIVE STANDARD. It has been urged by monometallists that a **STANDARD OF VALUE** formed of two metals is not really a double, but only an alternative standard, debtors, where payment is permitted in either metal, naturally electing to use the cheaper

in discharge of their obligations. Jevons says on this subject, referring to the countries included in the Latin union—"When silver is lower in price than 5s. 0½d. per ounce, silver becomes the standard; when silver rises above this price, gold takes its place as the real measure of value. So far the English economists are no doubt correct; but, in the first place, it does not follow that the prices of commodities follow the extreme fluctuations of value of both metals, as many writers have inconsiderately declared. Prices only depend upon the course of the metal which happens to have sunk in value below the legal ratio of 15½ to 1. . . . At any moment the standard of value is doubtless one metal or the other, and not both; yet the fact that there is an alternation tends to make each vary much less than it would otherwise do. It cannot prevent both metals from falling or rising in value compared with other commodities, but it can throw variations of supply and demand over a larger area, instead of leaving each metal to be affected merely by its own accidents." *Money*, by Prof. W. S. JEVONS, pp. 137-140.

It is alleged, on the other side. (1) That the currency may indeed alternate, in greater or less degree, under the influence of a difference of ratio in another bimetallic country; but that this does not affect the standard, nor the public right under a bimetallic law to have either metal coined at the legal ratio, and to pay one's debts in either at one's own choice.

(2) That, as to internal action, no one has yet shown how the debtor can obtain one metal at a "cheaper" rate than the other, inasmuch as it is inconceivable that the seller, who can get silver coined into a fixed number of francs or shillings at the mint, would be content to take a smaller number from any one else.

(3) That, as to external action, though it were true, which bimetallicists maintain it never was, that either metal was wholly absent from the circulation, yet the effect of the law on monometallic countries would, and always did remain intact, the open mint, and the right of sending either metal to be coined into the current money of the bimetallic state, making it impossible that the metal so sent could materially fall in price in the monometallic state remitting it; because such remittance must always be realisable at the rate of exchange current between the two states; and that accordingly the price (of silver, for example) in the English market, neither did nor could fall below 5s. 0½d., except so far as it might be modified by the current rate of exchange.

(4) That, consequently, a par of exchange was established and maintained between all silver- and gold-using countries. (See BIMETALLISM; GUINEA, RATING OF; STANDARD OF VALUE). These are the contentions on both sides.

[The difficulties experienced in keeping two metals in circulation are described in Sir I. Newton's three reports "Representations on the Subject of Money," 1711-1712, 1717. Private reprint of *Tracts on Money*, collected by J. R. McCulloch (London, 1856), pp. 269-279. The two principal of these reports are also reprinted in *Report and Proceedings International Monetary Conference, 1878* (Washington, 1879), pp. 317-321.—Also *Investigations on Currency and Finance*, Prof. W. S. Jevons.]

ALTHUSIUS, JOHANNES (1557-1638), a German writer, born at Diedenshausen (Witgenstein-Berleburg). He is said to have studied at Geneva under the influence of Calvinistic teachers. In 1586 he became professor of law and ethics at Herborn (Nassau), and in 1604 syndic of the free town of Emden. This honour was conferred upon him on account of his treatise on politics; in his new position he struggled successfully against the pretensions of the nobility and the count of Eastern Friesland. He died at Emden in 1638. His *Politica* is the first systematic treatise on that subject written in Germany; he regards politics as the art of constituting social life—"symbiotic art." The foundation of the organisation of "social life" is an express or tacit contract between associated men. As all rights therefore proceed from the people, they have the right of resistance against usurpations of authority. "Even if the people would like to do so, they could not transfer or alienate the sovereign power to any one else, just as no one can give to another the physical life he himself has." In consequence of these opinions Althusius has been ranked among the "monarchomachic school" (George Buchanan, 1579, *Languet*, 1579; Boucher, 1591; G. Rossaeus, 1590; Hotomannus, 1573; Mariana, 1599; Althusius, and John Milton, 1651), and was assailed by H. Arnisaeus, *De auctoritate principum*, 1611; GROTIUS, *De jure belli ac pacis*, 1625, I. ch. iii. § 8; CONRING, *De auctoribus politicis*, and BOECLER, *Institutiones polit.*, Argentor., 1674, II. ch. i. p. 102. Though forgotten in the latter half of the 17th century, this work seems to have had considerable influence upon the formation of the political ideas of ROUSSEAU (compare Gierke, p. 201). The social and economical ideas contained in it are remarkable. It analyses the historic forms of political associations in the order of formation, and distinguishes between associations for the realisation of private common interests ("peculiare commune"), both natural (the family) and civil (corporations), and associations for public interests (the "politeuma") both particular (parish, town, province) and universal (the state). In the latter resides the supreme power, controlled, however, by ephori, and exercised by supreme "magistratus," whose creation is effected by a contract; and the different forms of government

are only as many species of supreme magistrates, be they monarchical or polyarchical.

The views held by Althusius on economic policy and in respect of which he follows BOTERO, are contained in the 32d chapter (*De administratione mediorum ad vite socialis commoditates necessariorum*). Trade enriches, as is shown by the example of Venice and Genoa, the sovereign and the people. Therefore the sovereign must procure a steady supply of all things needed for the public weal, secure the public from enhancement of prices, prevent the importation of dangerous or immoral commodities, and the exportation of provisions. The establishment of staples and the maintenance of GILD regulations are recommended by Althusius, but monopolies should only be allowed in case private means are not sufficient or security is wanting. Among monopolies he reckons combinations of artisans. His definition of monopolies has been quoted by Edw. MISSELDEN, *Free Trade, or, the Means to make Trade flourish*, 1622, ch. iii. p. 59.

Politica methodice Digesta, Herbornæ, 1603, 2d ed., Groningæ, 1610; 3d ed., Arnheim, 1617; 8th and last ed., Herbornæ, 1654. His other works are: *Jurisprudentia Romana*, Herbornæ, 1588; *Dicæologice libri tres totum et universum jus, quo utimur, methodice complectentes*, Herbornæ, 1617; Francofurti, 1618.—See Otto Gierke, *Johannes Althusius und die Entwicklung der naturrechtlichen Staatstheorien*, Breslau, 1880, and Friedrich Althaus, *Theodor Althaus, ein Lebensbild*, Bonn, 1888. s. v.

ALTRUISM. Altruism is an ethical term which is often used in economic discussions on **SOCIALISM**, **LAISSEZ-FAIRE**, the functions of government, and generally questions of distribution. Altruism is the opposite of individualism or egoism, and embraces those moral motives which induce a man to regard the interests of others. Most English economists have written with the "regulative idea" that self-interest should at least provisionally and hypothetically be regarded as the mainspring of economic activity. In recent times, however, the tendency, especially under German influences, has been to give more weight to altruistic impulses.

[Compare Dr. Sidgwick's *Principles of Political Economy*, bk. iii. ch. ii.—and Prof. Marshall, *Principles of Economics*, bk. i. ch. vi.] J. S. N.

AMANA SOCIETY, THE, a communistic society and religious sect (*Wahre Inspirations Gemeinden*), consisting of Germans, established at Amana, Iowa Co., Iowa, U.S.A. More than a century after its foundation in Germany the sect, in 1843, emigrated to Ebenezer near Buffalo, and there adopted communism. The society thus formed eventually removed to Amana, where it still (1890) exists (see **COMMUNISM**). E. C.

AMERCEMENTS. The mediæval history of pecuniary penalties possesses an economical as well as a legal interest. Even in the royal courts of justice the decision of criminal or

civil causes was not the sole object aimed at. For it was also the duty of the court to assess and account for the various fines and amercements found to be leviable in the course of the sitting. These payments form a regular portion of the issues of the County, and are duly accounted for by the sheriff at the exchequer. Their amount was limited by the clause of the Great Charter declaring that no free man shall be amerced except according to the measure of his offence, and protecting from seizure the freeman's house and household goods and the villein's wainage. The local seigniorial jurisdictions imitated the royal courts in making a free use of pecuniary penalties, but there is reason to believe that the amercements inflicted by them were of a far more extortionate character. The clause in *Magna Charta* gave little or no protection to the **VILLEIN**, and the **STEWARD** or **REEVE** who presided in these local courts, naturally found their chief interest in raising as much money as possible by way of "profits of the court," a regular item in manorial accounts. A glance through Prof. Maitland's *Select Pleas in Manorial Courts* brings out the fact that the regular punishment for manorial offences, such as bad ploughing, or not coming to wash the lord's sheep, was an amercement, amounting in some cases to a tax of 6s. 8d. on the township. Besides this, fines were levied for breaking the **ASSIZE OF BEER**, for trespassing on the lord's wood, for fighting, and for a large number of other reasons. The amount of these must frequently have been burdensome. The oppressive reeve is expressly reproved in the *Ayenbit of Inwyt* (written 1340); in his *Parson's Tale* Chaucer devotes a long passage to the blame of extortionate amercements; and the same tone can be noticed in *Piers Ploughman*, passus ix. (C. text) and in Wyclif's writings.

[*Select Pleas in Manorial Courts*, vol. i., edited for the Selden Society by F. W. Maitland, 1889. —Chaucer's *Canterbury Pilgrims*; *The Parson's Tale*, 1386. *The Vision of Piers Ploughman*, text C. passus ix. 1393, Early English Text Society. —*Unpublished English Works of Wyclif*, Early English Text Society, 1880.] c. g. c.

AMERICAN SCHOOL OF POLITICAL ECONOMY. Strictly speaking, an American school of political economy has not yet arisen, but two movements are sometimes referred to under that title: (1) In the strong protective agitation which began in the United States about 1820, the name "American system" was applied to the general policy of developing the resources of the country by high import duties on the one hand, and by extensive internal improvements on the other. But the phrase obviously points to an episode in political history rather than to a movement in political economy. The best advocacy of this American system is to be found in the speech of Henry

CLAY on the tariff, made in 1824, easily to be found in the various editions of his writings. (2) With more propriety, the term American school may be applied to the doctrines of HENRY C. CAREY (*q.v.*) and his followers. The rejection of the Ricardian doctrine of rent and of the Malthusian theory, the general optimism, the reference of value in all instances to cost of production, the advocacy of protection, are easily seen to be connected with the conditions of a new country possessed of abundant fertile land, rapidly increasing in population and wealth, confronted as yet by few of the difficulties that beset older communities, constantly varying and developing its industries as time passes on. Carey's doctrines in this sense are American; they are the most distinctively national contribution which the United States has yet made to economic literature. None of Carey's followers approached him in the range or quantity of their writings. Among them may be mentioned:

Erasmus Peshine Smith, *A Manual of Political Economy*, Philadelphia, 1852, and later editions. —William Elder, *Questions of the Day*, Philadelphia, 1871. —Robert Ellis Thompson, *Social Science and National Economy*, Philadelphia, 1875, and later editions; *Protection to Home Industry*, New York, 1886. —W. D. Kelley, *Speeches, Letters, and Addresses*, Philadelphia, 1872. F. W. T.

AMORTISATION, or AMORTIZATION. The financial signification of amortisation is the redemption, reimbursement, liquidation, or repayment of debt generally, and the term is often applied in connection with the sinking funds of mortgages and debentures. Thus, in the recent rearrangement of the Venezuelan debt we read, "the surplus applicable, after covering the interest, to amortisation shall be applied half-yearly," etc., and in the instance of one of the Buenos Ayres loans—"the government have the power to at any period increase the amount of the amortisation." But the word is much more often used in French finance. Thus M. Waddington wrote to Messrs. Rothschild on 28th October 1878, "nous déclinons toute responsabilité relativement au paiement de l'intérêt et de l'amortissement de l'emprunt projeté." The French expressions "fonds d'amortissement" (sinking funds) and "caisse d'amortissement" (sinking fund office) are in common use. But here, in the sense of the amortisation of loans, the operation can be treated more in detail under the head of SINKING FUNDS (*q.v.*)

In law amortisation signifies the transfer of lands to a corporation, GUILD, or charitable body in perpetuity, or in other words, an alienation in mortmain. The laws in force restricting such amortisation of property in perpetuity are recounted under MORTMAIN (*q.v.*)

AMSTERDAM, BANK OF. See BANKS, EARLY EUROPEAN.

ANALYTICAL METHOD. We employ an

analytical method in science when we commence with particular facts, and, by analysing them, discover the laws in operation, thus working up to general principles; we employ a SYNTHETIC METHOD when we commence with general principles, known or assumed, and combine them so as to obtain conclusions that serve to explain particular facts. In the one case, we proceed from the individual to the universal; in the other, from the universal to the individual. In political economy one of the main controversies as to method turns on this distinction. It is maintained, on the one hand, that our starting-point should be the analysis of complex industrial phenomena; it is affirmed, on the other hand, that the science should be constructed by deductive reasoning from elementary laws of human nature.

In reality the contrast here indicated is far too sharply drawn. A true economic science can be built up only by a method of combined analysis and synthesis. The former without the latter would yield merely empirical results of uncertain validity, and disconnected with one another. The latter without the former would yield results always hypothetical, and sometimes entirely remote from the actual facts of the economic world. Hence the synthetical method is required to rationalise and systematise conclusions gained by the method of analysis, and the analytical method is in its turn required to guide and give reality to the synthetical. It may be said that upon this point, thus broadly stated, economists are, generally speaking, coming to agreement. At the same time, some difference of opinion is always likely to remain in regard to the relative importance of the two methods in economic science, and the extent to which, at different stages of inquiry, each should in its turn be subordinated to the other. In the last resort, some latitude must be left to the natural intellectual bias of the individual investigator. For further discussion of this question, see DEDUCTIVE METHOD; INDUCTIVE METHOD. J. N. K.

ANARCHISM is the theory held by a party which denies the justice and expediency of both government and property, and tries to overthrow these institutions by violence. At the peace congress of Geneva in 1867, MICHAEL BAKOUNIN (*q.v.*), a Russian exile, advocated the abolition of centralised states, and the substitution of voluntary federations of independent communes. He urged the next congress, held at Berne under the presidency of Victor Hugo in 1868, to declare in favour of socialism, and join the INTERNATIONAL (*q.v.*) Failing to convince the assembly, he formed his supporters into a "Social Democratic Alliance," the aim of which was to make land and capital the collective property of society, and secure that they should be used only by agricultural and manufacturing associations. All existing states were to "dis-

appear in the universal union of free associations." The Alliance desired to be recognised as part of the International, but its claim was rejected, whereupon it dissolved after six months' existence, during which it had been active in Spain and Italy, and its sections joined the International separately. At the beginning of 1869 the groups of the International in French-speaking Switzerland organised themselves as the "Romance Federation." This speedily split into two sections, one of which, under James Guillaume, a disciple of Bakounin, became the "Federation of the Jura." Bakounin, Guillaume, and shortly afterwards the whole Federation, were expelled from the International. The Federation did not acquiesce in its expulsion, but held meetings in 1873, 1874, 1876, and 1877, which professed to be the sixth, seventh, eighth, and ninth general meetings of the International. To its influence Prince Kropotkin, in 1882, ascribed the greater part of the growth of anarchist opinions in France and elsewhere. As early as at the meeting of 1873, Brousse said incidentally "anarchy is your programme," but it was not till five or six years afterwards that the "anarchists" became definitely known by that name, and ceased to rank as collectivists (see COLLECTIVISM). In August 1882, a meeting held at Geneva for the express purpose of making clear "the separation of the anarchist party from all political parties," issued a manifesto which declared the enmity of "anarchists, that is men without chiefs," to all who have, or wish to get power—to the landowner, the capitalist employer, the state, "abstractions of authority," such as God and the Devil, and "the law, always made for the oppression of the weak by the strong." "We declare ourselves allies of every man, group, or society which denies the law by a revolutionary act. We reject all legal methods. . . We spurn the suffrage called universal. . . We wish to remain our own masters. . . Nevertheless we know that individual liberty cannot exist without association with other free comrades. . . Every social product is a result of collective work to which all are equally entitled. We are therefore communists; we recognise that without the destruction of family, communal, provincial, and national boundaries, the work will always have to be done over again." The idea of making the commune the basis of a social reorganisation was a mere Russian importation (see MIR), which never obtained any hold on western minds, and may have been discredited by the failure of the COMMUNE OF PARIS (*q.v.*) to establish its independence. The "free association," which has taken the place of the commune, has acquired no definite shape. Anarchists are content to believe that every one would behave properly if governments with their forcible methods were abolished. They are not satisfied with

watching or even with accelerating the gradual elimination of force which marks the progress of civilisation, but insist on the immediate extinction of force by force.

Bakounin died in 1876; the chief agitators who have carried on his work are Prince Kropotkin, Elisée Reclus, and Emile Gautier in Switzerland and France, and Most, editor of the *Freiheit* newspaper among Germans, first in England, and afterwards in America (see COMMUNISM; SOCIALISM; NIHILISM; PROUDHON).

[J. Garin, *L'Anarchie et les Anarchistes*, 1885. —E. de Laveleye, *Le Socialisme Contemporain*, 3^{me} ed. 1885, ch. ix. x.—Elisée Reclus, "Anarchy" in the *Contemporary Review*, May 1884 (xlv. pp. 627-641, especially 635, 636).—John Rae, *Contemporary Socialism*, 1884.—Prince Kropotkin, "The Scientific Bases of Anarchy," in the *Nineteenth Century*, February 1887 (xxi. pp. 238-252, especially 242).—"The Coming Anarchy," *Ibid.*, August 1887 (xxii. pp. 149-164).—R. T. Ely, *Recent American Socialism* (Johns Hopkins University Studies, 3d Series, No. 4), April 1885.—Wm. Godwin's *Political Justice*, 1793, is to a great extent an anticipation of the anarchist theory.]

E. C.

ANATOCISMUS. A term employed in the technical language of the civil law for compound interest. The Roman law did not allow compound interest and even prevented a creditor from claiming an accumulation of simple interest in so far as it exceeded the amount of the principal.

E. S.

ANDERSON, ADAM, born in Scotland about 1692, was for forty years a clerk in the South Sea House. He died at Clerkenwell, 10th January 1765. His only work was—

An Historical and Chronological Deduction of the Origin of Commerce from the Earliest Accounts to the Present Time, London, 1764, 2 vols. folio (a monument of industry in the form of annals, treating specially of Great Britain and Ireland). A new edition, *carefully revised and continued* (by Wm. Combe), London, 1787-89, 4 vols. 4to. Anderson's text from 1492 to 1760, was incorporated by David MACPHERSON in his *Annals of Commerce*, London, 1805, 4 vols. 4to. H. R. T.

ANDERSON, JAMES, LL.D., born at Hermiston, near Edinburgh, 1739, died at West Ham, Essex, 15th October 1808. A practical farmer, employed by PITT to survey the fisheries, Scottish rural economy owes much to him. Dr. Anderson first propounded the theory of "rent," afterwards rehandled by MALTHUS and RICARDO. In his works, *e.g.* in his *Observations on the National Industry of Scotland* (vol. ii. pp. 208-9, published 1779, but written 1775), he says that rent is a premium for the cultivation of the richer soils, reducing the profits of the cultivators to an equality with those of the cultivators of the poorer.

He edited *The Bee*, Edinburgh, 1790-94, 18 vols. 8vo;—*Recreations in Agriculture, Natural History, etc.*, 1799-1802, 6 vols. 8vo, and wrote among

other things :—*Inquiry into the Nature of the Corn Laws, with a View to the new Corn Bill proposed for Scotland*, Edinburgh, 1777, 8vo (the earliest explanation of the theory of rent usually called after Ricardo ; see also his *Recreations*, v. 401-28).—*Inquiry into the Causes that have hitherto Retarded the Advancement of Agriculture in Europe*, Edinburgh, 1779, 8vo.—*Account of the Present State of the Hebrides and Western Coasts of Scotland*, Edinburgh, 1785, 8vo.—*Essays Relating to Agriculture and Rural Affairs*, 5th ed., London, 1800, 3 vols. 8vo.—*Investigation of the Circumstances that have led to the Present Scarcity of Grain in Britain*, London, 1801, 8vo (friendly to protection).
H. R. T.

ANDERSON, JAMES (No. 2). Passages such as *Observations on the National Industry of Scotland* (vol. ii. pp. 208-209, published 1779, but written 1775) show clearly that Anderson had a more correct view of the theory of rent than his greater contemporary and compatriot, A. SMITH. Rent, he says, is a premium for the cultivation of the richer soils, reducing the profits of the cultivators to an equality with those of the cultivators of the poorer.
J. B.

ANGARIE, DROIT D' (*ἀγγαρεία*, see St. Matthew v. 41). Angarie means in international law the actual impressment of foreign (even neutral) vessels, as distinguished from embargo, which is mere exclusion from the ports. The right was exercised by the Prussians in the war of 1870-71, when they sank six English ships in the Seine.
J. B.

ANGEL. English gold coin (Edward IV. to Charles I.) of the following weights, fineness, and value—

Reign.	Year.	Rating.	Weight.	Fine-ness.	Value in gold 916·6, fine at £8 : 17 : 10½ an oz.
Edward IV.	1466	6s. 8d.	85·25 grains.	994·8	15s.
Henry VIII.	1527	7s. 6d.	80	"	14s. 1d.
"	1543	8s.	"	916·6	12s. 11½d.
Edward VI.	1551	"	"	994·8	14s. 1d.
Mary	1553	10s.	"	"	"
Elizabeth	1601	"	79	"	13s. 11d.
James I.	1605	"	71	"	12s. 6d.
"	1606	"	65·5	"	11s. 6½d.
"	1610	11s.	"	"	"
"	1619	"	64·25	"	11s. 3½d.
Charles I.	1627	10s.	"	"	"

F. E. A.

ANNA (British India). One sixteenth of a rupee. Silver coins: 4 and 2 annas, 916·6 fine; weight 45 and 22½ grains; value 6½d. and 3¼d., or ·59 fr. and ·30 fr. respectively.
F. E. A.

ANNATES. This was the first year's revenue of a bishopric or benefice which was paid to the pope in all countries which acknowledged his spiritual headship. It is probable that the practice was not introduced into Eng-

land until after 1213, when John did homage to the papacy. This and other papal exactions were very unpopular in England, and the clergy themselves petitioned for the abolition of annates, when Henry VIII. quarrelled with the pope about his divorce. A bill for this purpose was passed by parliament in 1532, but Henry postponed his consent, hoping to use it as a means of influencing the Roman court. In 1534, however, the Annates Act became law. Besides prohibiting the payment to Rome, this Act also laid down the regulations for the choice of bishops which are still observed. To the great disappointment of the clergy, the annates, instead of being abolished, were transferred to the crown. Mary surrendered them, but they were restored to the crown under Elizabeth. Ultimately Anne gave them back to the church, in order to subsidise small livings, and the fund still exists under the name of Queen Anne's bounty.

[Perry, *History of the English Church*, 1887, vol. ii.]
R. L.

ANNEALING. Most metals and alloys, when submitted to the operations of rolling or wire drawing, lose their malleability or power of being extended. This may be restored by *annealing*, which consists in raising the metal to a high temperature, usually above redness, and allowing it to cool slowly. With some metals it is immaterial whether the cooling from the high temperature takes place rapidly or slowly. Thus certain alloys of copper and tin are rendered most malleable by rapid cooling and the same observation applies to alloys of iron and manganese which contain more than 8 per cent of manganese. In the preparation of steel for industrial use annealing is of great importance, and the particular temperature suitable to each variety of steel has to be determined with great accuracy. The density of rolled metals is generally diminished slightly by annealing. The process is of importance in the coinage of the precious metals (see ALLOY).
C. R.-A.

ANNUAL RENT (Scotch). Nearly equivalent to rent charge.

ANNUITY. The simplest way in which an annuity can be defined from an economic point of view is to regard it as a payment in one instalment, or in any number of instalments, composed (1) of the sinking fund to redeem or restore the principal or purchase money of the annuity by an investment increasing at interest in geometrical progression; and (2) of the interest on the principal or purchase money and its unredeemed balances throughout the term of the annuity, such interest decreasing in geometrical progression until the sinking fund replaces the whole of the principal or purchase money. Thus, if an annuity of £100 for one year be bought to pay 3 per cent interest, it is worth £97·0874 purchase money, and the annuity itself is made up :—

- (1) Of the present value at 3 per cent interest of the sum of £100, due at the end of one year, or of a sinking fund of £97·0874
- (2) Of the interest at 3 per cent for one year on the £97·0874 purchase money 2·9126

Total annuity £100·0000

The value of each instalment for any term of years for which an annuity is granted, may be similarly calculated; thus, the value at 3 per cent interest of an annuity of £100 per annum to endure in perpetuity or for an infinite number of years, may be stated in the same manner as made up:—

- (1) Of the present value of £3333·3333 (or of the purchase money at 3 per cent of a perpetual annuity of £100) redeemable at the end of an infinite number of years . . . £000·0000
- (2) Of the annual interest at 3 per cent upon the £3333·3333 purchase money 100·0000

Total annuity £100·0000

In any scheme of taxation which deducts a percentage, or so much in the pound, upon the whole or gross amount of an annuity, without distinguishing between what part of it is sinking fund and what part interest, the result is that the fiscal burden infringes on property as well as on income, although in ordinary language this common mode of procedure is called an income-tax. If it were so purely and truly, it would, in the first of the above examples, make a deduction for tax, not upon the whole £100 of annuity, but upon £2·9126 only, so that the exaction is more than thirty-three times too great. In the second example the tax is rightly levied upon the whole £100 of annuity, as there is no possible existence of a sinking fund where the term the annuity has to run is infinite. It follows that the shorter such term is the greater is the inequity of assessment, and the longer the term the less its inequity. So much has this been felt by those who purchase annuities or rent charges by way of equated payments continuing for a given number of years, that it is not uncommon for purchasers of such annuities, or lenders of money on their security, to contract themselves out of the incidence of the INCOME-TAX on that part of the annual payment which represents SINKING FUND. This is done by the annuity or mortgage-deed containing a schedule setting forth in separate columns what is sinking fund and what is interest. Thus, for example, in an annuity of £100 granted for two years and calculated to pay the purchaser 3 per cent, the value or purchase money of this is, by calculation, £191·3470. The schedule runs thus:

Col. 1.	Col. 2.	Col. 3.	Col. 4.
Year.	Repayment of Purchase Money.	Interest on Yearly Balance of Purchase Money.	Total Annuity (col. 2+col. 3).
1	£94·2596	£5·7404	£100·
2	97·0874	2·9126	100·
Total payments	£191·3470	£8·6530	£200·

By this means income-tax becomes assessable in the two years upon £8·6530 instead of upon £200.

The same methods of analysis of an annuity ceasing at the death of a single life or of the survivor of any number of lives, could be applied so as to distinguish between capital and income, and the sinking fund and interest admit of being similarly separated and defined from the initial year or age at which the life-annuity commences to its ultimate or terminal year, which, in such cases, is the oldest age to which it is possible the life or lives can attain, according to the particular table of mortality on which the annuity is based or valued.

From what has been above stated several important economic conclusions follow—(1) that when a state borrows money by grant or sale of TERMINABLE ANNUITIES ceasing at the expiration of a certain number of years, long or short, and its fiscal system at the same time includes the imposition of what is called an income-tax, such a tax falls upon the whole of the capital out of which the annuity is constituted, and the tax becomes one on property as well as on income; (2) that although the system of borrowing on terminable as compared with that of borrowing on perpetual annuities has been frequently extolled as the more provident and beneficial of the two arrangements, it is really subject to much qualification, as it involves in every instance an obligatory sinking fund, which cannot be suspended, for the repayment of principal. This must continue for the whole of the term of years the annuities have to run, during which the borrower (and few modern states fail to be in that position over many years) is hampered with the prejudicial condition of having to borrow to pay debts, a course generally antagonistic to the principles of sound finance; (3) that as in these terminable annuities the state as borrower repays portions of principal combined with every payment of interest, the state creditor, small as well as great, is, in his turn, compelled to reinvest, periodically and with undeviating regularity, fractions of the principal returned to him, unless he be content to see his capital destroyed. This necessity of re-investment is a troublesome, and sometimes a difficult, task, and has a tendency

towards improvidence on the lender's part, as it exposes him to the temptation of omitting to save the means by which he may restore his capital; (4) the knowledge of these circumstances and the unfair incidence of the income-tax on terminable annuities combine in rendering it impossible, as a general rule, for large state loans to be contracted at as low a rate of interest in terminable annuities as in perpetual annuities. The market price of the former as compared with the latter has in almost every known instance revealed a lower public estimation of the terminable annuity, and it has shown that as the repayment of the principal augments in geometrical proportion with each instalment, the depression of the security grows greater and greater as the annuity approaches nearer and nearer to its terminal period. Out of the total sum of about 585 millions sterling raised by loans in England in 1792-1816, not more than $1\frac{1}{2}$ per cent can be estimated to have been obtained through the employment, as an adjunct to other financial methods, of the terminable annuity system. The remaining $98\frac{1}{2}$ per cent of what in those days was a huge mountain of fresh indebtedness, was raised by perpetual annuities. The terminable, or long annuities as they were called, mostly granted for sixty years, were only floated on terms of market valuation imposing a differential and higher rate of interest on the borrower of at least 1 per cent as compared with the terms for perpetual annuities. The writer of the present article was associated with the late Mr. NEW-MARCH, in 1854-55, in the investigations that served as the basis of the elaborate essay by that economist *On the loans raised by Mr. Pitt during the first French War, 1793-1801, with some statements in defence of the methods of funding employed*. London: Effingham Wilson, 1855 (*vide* pp. 29-31). This essay has now become extremely scarce. A short paragraph may be quoted from it as giving the pith of a very laborious inquiry. "Upon mere financial grounds a public loan contracted in terminable annuities is, perhaps for the state, the form of borrowing the most desirable, for at the lapse of the term the annual burden of the debt ceases. But connected with the plan of terminable annuities there are other considerations of a higher and more general nature than those of mere finance; and when the whole question has to be discussed it will appear, that while terminable annuities may be employed with advantage as one of several forms of funding, it would be exceedingly unwise to resort to them as the sole or even as the principal method." For TERMINABLE ANNUITIES see DEBT, NATIONAL.

F. H.

ANSELL, CHARLES, F.R.S., born 1794, died 1881. He entered the Atlas Fire and Life Assurance Company in 1808, became actuary of the life branch in 1823, and held the office

down to 1864. He applied himself much to the actuarial problems connected with friendly societies, and wrote—

A Treatise on Friendly Societies in which the Doctrine of the Interest of Money and the Doctrine of Probability are applied, London, 1835, 8vo (published by the Society for the Diffusion of Useful Knowledge; one of the first attempts to treat the subject scientifically).

H. R. T.

ANTEDATE. To date a document from a point of time earlier than the actual date of execution. If this is done with the intention of defrauding a third party, the parties to the document are liable to be prosecuted for forgery.

E. S.

ANTICHRESIS. A contract of Roman law by which a mortgagee acquired the right to take the profits of the mortgaged property in the place of interest on the mortgage debt. Such contracts were not allowed, if they were made with the intention of evading the Roman usury laws.

E. S.

ANTI-CORN-LAW LEAGUE. It cannot be doubted that the irritation caused by the agitation for the factory acts, which applied to children only in the manufacturing districts, and not to those in the agricultural part of the country, supplied a great stimulus to the agitation against the corn laws. The formation of an association under the name of the Anti-Corn-Law League was the inevitable consequence, and apart from an active canvass all over the country, the association at last started a newspaper of great force and ability under the name of the *League*, complete copies of which are now very uncommon.

The success of the League was in great degree assisted by the potato plague and the very scanty harvest of 1845. Sir R. PEEL, then in power, took the step of opening the ports, an expedient which the executive had frequently adopted during the scarcities of the 18th century. It was impossible to reverse this policy, and the repeal of the corn laws became inevitable in the next session of parliament. It is remarkable that a parliament certainly summoned to defend and maintain the laws, should have been the instrument of extirpating them, but the situation could not be trifled with, and Peel, as the introducer, said that his action averted the troubles of 1848 from the United Kingdom.

As soon as the act repealing the corn laws had received the royal assent, the leaders of the League at once broke up their organisation and extinguished the machinery which they had driven at high pressure. This policy was exceedingly conciliatory, and greatly assisted in obviating any reaction.

J. T. R.

ANTI-RENT AGITATIONS. The phrase has been used by English writers with special reference to the movement countenanced by O'Connell in 1843, and a similar movement

countenanced by some of the Irish leaders in 1881, among the Irish tenants. In both cases the threat to pay no rent was a temporary expedient to enforce an article of popular policy. The advocates of the nationalisation of the land cannot be said to conduct an anti-rent agitation, for they do not aim at the removal of rent, but at a change of landlords. In the United States the name "anti-renters" was given to the farmers of New York State, holding their lands on long leases, who demanded the removal of quit rents and ground rents (1839-46). The movement led to riot and bloodshed; and was at the time only partially successful, though now the system of land-tenure which occasioned it has all but wholly disappeared.

See E. P. Cheyney, *The Anti-rent Agitation of the State of New York*, Philadelphia, 1887. J. B.

ANTONINUS, Sr., archbishop of Florence, was born 1389 and died 1459. Following AQUINAS (*q.v.*), Antoninus defines what transactions are to be condemned as usury; and remarks on the difficulty of determining the fair price JUSTUM PRETIUM of an article on sale. See his *Summa Theologia in quatuor partes distributa*, 2d Part, Title II. ch. 6, 7. F. X. E.

A POSTERIORI reasoning is reasoning that is directly based on observation and inductive generalisation. It follows, therefore, and does not precede experience of the specific class of phenomena to which the conclusion relates. The kind of reasoning with which it is contrasted is called A PRIORI (*q.v.*)

It is held by the majority of English economists that in political economy the purely a posteriori method is inefficacious for arriving at any considerable body of valuable truth. The opposite view is maintained by the HISTORICAL SCHOOL OF ECONOMISTS. Without entering here upon the controversy between these schools, it may be pointed out (1) that the a posteriori method is, in certain cases, employed even by those who for the most part reject its aid in economic reasoning; and (2) that when entire reliance is not placed upon it, it may still be used to supplement reasoning of a different type. As an illustration of a posteriori reasoning in economics, reference may be made to MILL's treatment of the subject of peasant proprietorship in the second book of his *Principles of Political Economy*. A considerable mass of evidence is cited as to the working of this system in those countries in which its operation can be observed on a large scale; and the force of Mill's argument as to the influence of peasant properties in stimulating industry, training intelligence, and promoting forethought and self-control, depends more upon the generalisations that the above evidence seems to justify, than upon direct deductions from general principles of human nature.

A posteriori reasoning is also described as analytical, and as inductive. For further discussion, see ANALYTICAL; DEDUCTIVE; INDUCTIVE; SYNTHETIC METHOD. J. N. K.

APPANAGE (French *apanage*, from Provençal verb *apanar*, to give bread), the provision made by French kings and barons for daughters and younger sons (*puîs-nés*), as distinguished from the eldest son (*ainé* = *aisné*, *avant-né*). The appanage of royal princes consisted in some cases of lands so extensive and wealthy (e.g. Normandy or Burgundy) that the possessors were dangerous rivals to the monarch himself, especially as the salic law increased their prospects of ultimate succession to the throne; hence the attempts (e.g. of Charles V. in 14th century) to limit the appanage of sons to a specified money revenue from land. As early as Philip Augustus (13th century), the daughters' dowries were paid in that form. From St. Louis downwards (13th century), the kings tried to secure the reversion of the appanage to the crown on failure of male heirs; and the crown lands ceased in point of fact to be redivided. Appanages were abolished by the constituent assembly in 1790, and the burden put on the civil list; revived by Napoleon and the Bourbons, they disappeared definitively in the revolution of July 1830.

The corresponding provision in England is an annual income voted by parliament out of the imperial taxes (e.g. in 1889 for the Queen's grandchildren). A similar course is followed in Italy. In many German states the appanage is often a mere rent-charge on crown-lands. The German lawyers of last century confined the term *apanagium* to the provision in money, and used *paragium* for provision in lands (see CIVIL LIST). J. E.

APPLETON, NATHAN, merchant and cotton manufacturer; born in New Hampshire 1779; died in Massachusetts 1861. He was one of the three founders of the great manufacturing town of Lowell; served a number of years in congress, where he was a champion of Whig principles. His best known pamphlet is *Remarks on currency and banking*, Boston, 1841, pp. 48 (3d ed. 1857, pp. 63). He favoured a national bank as a fiscal agent of the treasury, but denied its necessity to regulate the currency, equalise the exchanges, or supply a uniform paper medium. He also wrote *An examination of the banking system of Massachusetts in reference to the renewal of the bank charters*, Boston, 1831, pp. 48. Appleton objected to state banks with small capitals: the bank should have a paid-up capital exceeding its issues; and the tax should be upon the circulation instead of upon the capital. He persistently advocated high tariff duties by speeches in congress; of these the one of 30th May 1832 is the most valuable, in which he criticised at length the theory that a tax on imports is a tax on exports. In an article on *Labour*

in *Europe and America compared*, Hunt's Magazine, 1844, pp. 16, he denied that the theory of wages as stated by English economists applied to American labour, owing to the cheapness of land. A list of his writings is found in Robert C. Winthrop's *Memoir of Nathan Appleton*, Boston, 1861, pp. 64.

Among them may be mentioned, *What is a Revenue Standard? and a Review of Secretary Walker's Report*, 1846.—*Introduction of the Power-Loom and Origin of Lowell*, 1858.

D. R. D.

APPLIED ECONOMICS. The term *applied economics* or *applied political economy* has been used in at least three different senses: (a) To designate the application of economic science to the solution of practical questions; in this sense equivalent to what is also called the ART OF POLITICAL ECONOMY. (b) To designate the application of economic science to the interpretation and explanation of particular economic phenomena. (c) To mark off the more concrete and specialised portions of economic science from those more abstract doctrines, which are held to pervade all economic reasoning. The term is used in this last sense by JEVONS when he remarks that "currency, banking, the relations of labour and capital, those of landlord and tenant, pauperism, taxation, and finance, are some of the principal portions of applied political economy, all involving the same ultimate laws, manifested in most different circumstances." (*Fortnightly Review*, Nov. 1876, p. 626.)

J. N. K.

APPORTIONMENT (No. 1). The distribution of one subject in proportion to another previously distributed. Though RENTS form the chief subject matter of apportionment, the term is also applied to the division of covenants and conditions. As regards rents a distinction has to be drawn between rent services and rent charges. A rent service may be apportioned by (1) act of God; (2) operation of law; (3) act of parties. (1) Where a portion of land demised is surrounded or covered by the sea, this being the act of God, the rent is apportioned so that the tenant pays rent in respect of the uncovered land only. (2) At common law there could be no apportionment of rent in respect of time, the contract for payment being regarded as "entire," or incapable of division. Hence a successor in interest succeeding before a periodical payment became due took the whole, and the representatives of his predecessor took nothing. This was remedied by the 11 Geo. II. c. 19, § 15; 4 & 5 Will. IV. c. 22; and 33 & 34 Vict. c. 35. The effect of these statutes is that all rents, annuities, dividends, and other periodical payments in the nature of income are like interest on money lent, to be regarded as accruing from day to day, and to be apportionable in respect of time.

(3) Where a part of a reversion was granted away, an apportioned part of the rent passed with it as incident thereto. By the 22 & 23 Vict. c. 35, § 3, where a reversion is severed into parts, and the rent is "legally apportioned," the assignee of each part becomes entitled, as regards his part, to the benefit of all conditions for securing the payment of rent attached to the original undivided rent, and the 10th section of the Conveyancing Act, 1881, extends this principle, and renders all conditions and provisos apportionable.

As regards rent charges, the general rule was that they could not be apportioned, and hence if the owner of a rent charge purchased any portion of the land out of which it issued, the whole rent charge became extinct. This was remedied by the 10th section of the 22 & 23 Vict. c. 35, which provided that the release from a rent charge of a part of the land charged, should only bar the right to recover any part of the rent charge out of the land released.

[*The Law of Rents*, by W. A. Copinger and J. E. C. Munro, London, 1886.] J. E. C. M.

APPORTIONMENT (No. 2). Apportionment may be further explained as the distribution of benefits or burdens connected with property among several persons becoming successively or simultaneously owners of the property to which they refer. With regard to *successive* owners, rent and other periodical payments were formerly not apportionable. If land was leased for the life of the tenant-for-life only, the sub-tenant was not liable to pay any rent for the period between the last payment and the death of the tenant-for-life. If the lease extended beyond the life of the tenant-for-life, and if the person entitled to the rent for life died on the day before the rent became due, his representatives could not claim any part of the rent, and the whole of it went to the person next entitled to the income of the land; the same thing happened with respect to dividends on stock, or annuities to which a person was entitled for life. Successive acts of parliament, beginning with one passed in the reign of George II., have gradually removed these anomalies, and now the Apportionment Act of 1870 provides that all rents, dividends, and periodical payments in the nature of income, shall be considered as accruing from day to day, and shall be apportionable in respect of time accordingly. Apportionment of benefits or burdens between persons becoming *simultaneously* owners of property was formerly not possible in many cases. Rent-charges, for instance, were not apportionable, and if the owner of a RENT-CHARGE purchased part of the land subject to it (which naturally had the effect of releasing that part from the rent-charge) the whole property became discharged; in the same way the benefits of conditions of re-entry and other conditions in leases could

not be apportioned; if land subject to a lease was sold in part or sold in several lots, the benefit of such conditions lapsed entirely. Ordinary rent was always apportionable between persons becoming simultaneously the owners of the property with respect to which it was payable, and modern acts (among which the Property Law Amendment Act of 1859, and the Conveyancing Act of 1881, are the most important) have provided for the apportionment of rent-charges, and of the benefit of conditions in leases among simultaneous owners of land subject to a rent-charge or a lease. Under the TITHE COMMUTATION ACT of 1836, the rent-charge in lieu of tithes may be specially apportioned, so as to throw the amount attributable to the tithes of an entire estate upon some particular persons in exoneration of the residue.

E. S.

APPRAISERS. Sworn and licensed valuers of poinded goods (goods on which execution is levied) in Scotland. The business of appraisers (valuers) in England is usually conjoined with that of the auctioneer.

APPRECIATION OF STANDARD. The alterations in purchasing power of the standard of value are, when the period over which the investigation extends is only a short one, among the most difficult questions into which the economist has to inquire. Remote events stand out in this respect more clearly. The great, and up to the present time permanent, depreciation occasioned by the enormous finds of the precious metals in South America which followed the discovery of that continent by Columbus, is now matter of history, as is also the further change in the same direction occasioned by the development of new mines in California and Australia, commencing rather less than fifty years ago. During a comparatively recent period, however, now extending over ten or fifteen years, the balance appears to have turned the other way, and an appreciation of gold, to a considerable extent, to have taken place. It was pointed out by Giffen, *Essays in Finance*, 2d series, p. 19, that average prices, 1885, stood "about 5 per cent less than the average of 1845-60," and by Palgrave, *Appendix B, Third Report of Royal Commission on Depression of Trade and Industry*, pp. 329, 330, that, as compared with 1865-69, prices in 1885 showed a drop of more than 20 per cent. *The Variation of Prices and the Value of the Currency since 1782-1865*, a paper by JEVONS, *Journal of the Statistical Society of London* for June 1865, reprinted in his volume *Investigations in Currency and Finance*, shows the oscillations of prices very clearly. Periods of transition in matters of this description are, as CHEVALIER remarks (*De la Baisse Probable de l'Or*), painful to pass through. It is here, however, the fact of a recent appreciation which it is desirable to note, not the causes

which have led to it, or the results which have followed it. Though the tendency of the standard of value appears, so far as history extends, to have been generally towards depreciation, and not towards appreciation, so recent and marked an instance of appreciation deserves record (see also DEPRECIATION OF STANDARD, STANDARD OF VALUE).

[For history, Jacob, *On the Precious Metals* London, 1831.—Jevons, *Investigations in Currency and Finance*, London, 1884.—Giffen, *Essays in Finance*, 2d series, London, 1886.—Palgrave, *Appendix B, Third Report, Royal Commission on Depression of Trade and Industry*, 1886.]

APPRENTICESHIP. A system by which those intended to follow a particular occupation engage to serve and work under a master for a certain period, and the master engages to teach them during that period the industry or branch of industry in which he is occupied. This system was once very common, if not universal; and with few, if any, exceptions, every workman was compelled to serve a master for seven years before he could practise a handicraft on his own account. A large number of the rules and regulations of the mediæval craft guilds (see GUILDS) dealt with the conditions of apprenticeship; and a solemn ceremonial was observed when a boy was bound over to be an apprentice, and when, the period of his service being ended, he became a full member of the guild. These rules and regulations, which obtained the binding authority of uniform custom, were embodied in law by the statute of apprenticeship (5 Eliz. c. 4) by which it was "enacted that no person should for the future exercise any trade, craft, or mystery at that time exercised in England unless he had previously served to it an apprenticeship of seven years at least." The system, however, was open to abuse; and Adam SMITH (*Wealth of Nations*, bk. i. ch. x. part ii.), protested against the way in which the trade corporations employed it, to maintain a monopoly of their exclusive privileges. But gradually it came to be held that industries which had arisen since the passing of the statute, or which were not carried on in market towns, were exempt from its limitations; and in the development of factory industry at the close of the last and the commencement of the present century, manufacturers exhibited a wholesale disregard of the restrictions of apprenticeship. The efforts of the early trades unions (see TRADES UNIONS) were directed in many cases towards securing the observance of the ELIZABETHAN LEGISLATION. Prosecutions were instituted against the masters with successful results. But the operation of this statute was suspended by parliament for the cloth trade during successive years from 1803 to 1809, and in the last year it was altogether rescinded for that trade, and in 1814 for all trades. The custom, however, of apprenticeship

continued to prevail; and it still forms part, in theory at least, of the policy of some trades unions to attempt, by positive regulation or otherwise, to restrict the number of apprentices, and to insist on the production of evidence of having served a regular apprenticeship before a man is admitted to the membership of the union. But despite of these efforts the system appears, with the growing subdivision of labour, to be falling into disuse, in many trades, at any rate in its strict form. Some writers have urged, although others have maintained that this is impracticable, that technical education should be generally introduced as a substitute for apprenticeship.

[For the regulations of the old craft guilds on the matter cp. Brentano on *Gilds* and Howell's *Conflicts of Capital and Labour*, ch. i. pt. iv. For the efforts of early trades unions cp. the same book, ch. ii., and Arnold Toynbee's *Industrial Revolution: Lecture on Industry and Democracy*, pp. 178, etc. For the present attitude of workmen cp. Howell, ch. v. and Marshall's *Economics of Industry*, bk. iii. ch. v. §§ 3 and 9. A list of recent German works on Apprenticeships is given by Prof. Stieda in an article in *Jahrbücher für Nat. Oek. u. Stat.* 21st June 1890 ("Das gewerbliche Lehrlingswesen").]

L. L. P.

APPRENTICESHIP, STATUTE OF (5 Eliz. c. 4). This statute is of considerable importance in the history of English labour. Its general drift was not new. Many of its provisions had been previously enacted. The preamble points out the failure of former statutes "partly through the imperfection and contrariety" in the laws themselves, and "chiefly for that the wages and allowances . . . are too small, and not answerable to this time (1562) respecting the advancement of prices of all things." The legislature proposed therefore "to digest and reduce into one sole law" the substance of the old statutes, in the hope that the new law (duly executed) would "banish idleness, encourage husbandry, and yield unto the hired person, both in the time of scarcity and in the time of plenty, a convenient proportion of wages." Former statutes, thirty-four in number since Edward III., were repealed so far as they concerned the hiring, keeping, wages, etc. of servants, labourers, artificers, and apprentices. According to the new statute certain persons were confined to the craft in which they were brought up, and all persons not otherwise employed, nor possessing a certain amount of property, were compelled to serve in husbandry. The latter clause was supplemented with a law of settlement, which however was relaxed in time of harvest. The regulations with regard to apprenticeship were important. The term of apprenticeship was to be seven years. Except in the case of smiths, wheelwrights, plaisterers, bricklayers, etc., certain property qualifications were necessary for apprenticeship, and the craft

could be carried on only by those who had served their time. Every person with three apprentices must keep one journeyman. No one could be apprenticed over the age of twenty-one. Penalties of imprisonment were imposed on those who refused to be apprenticed. The act was administered by the justices of the peace, or other magistrates specified in the act. They were empowered to fix the rate of wages in their districts, etc. at the Easter Quarter Sessions, and to enforce this rate by fine and imprisonment. They were also to arbitrate in disputes between masters and apprentices. The hours of labour were to be from 5 A.M. till 6 or 8 P.M. in the summer, and from daylight to dusk in the winter, not more than two and a half hours being allowed for meals. There were numerous other provisions of a less important character. By 39 Eliz. c. 12 the act was extended to weavers. It was continued by 43 Eliz. c. 9, and 1 Jac. c. 6, the latter of which extended the power of the justices and town magistrates to fix limits to the wages of all labourers and workmen whatever. As Prof. Rogers points out (*Agriculture and Prices*, vol. v. p. 821) the law was "effectually supplemented" by 14 Car. II. c. 12, 3 W. and M. c. 11, 8 & 9 Will. III. c. 30, 9 Will. III. c. 11, and 11 Will. III. c. 13.

It is not easy to form a just estimate of the effects of Elizabeth's legislation. The materials are scanty, and contemporary evidence of the working of the statute difficult to obtain. A. SMITH (*Wealth of Nations*, bk. i. ch. x. pt. ii.) criticised the apprenticeship clauses in terms which were certainly justified at the end of the 18th century. Brentano (*English Gilds*, § 5) has taken a more favourable view of the statute, and has produced evidence to prove that modern trade unions originated in the non-observance of its provisions. Brentano's criticism, however, is open to much adverse comment. Prof. THOROLD ROGERS attributed much of the misery of the working classes in succeeding generations to the operation of this statute. He described it (*Work and Wages*, p. 353, cp. also *Agriculture and Prices*, vol. v. ch. xxiii., xxviii.) as "the third in the set of causes from which pauperism was the inevitable effect." He justly remarks that the statute "seems to favour traders and artisans at the expense of labourers in husbandry, by limiting the number of the former and making the latter the residuum of all non-apprenticed labour." It may be doubted, however, whether at present it is possible to form an accurate judgment with regard to the working of the statute. Comparatively few wages assessments have yet been discovered. In 1793, RUGGLES could refer to only one. Sir F. EDEN increased the number to eight, and Thorold Rogers to eleven. Four more are printed in Hamilton's *Quarter Sessions from Elizabeth to Anne*,

pp. 12, 163, 249, and 273, and two in the Belvoir Papers (one of them, 9th April 1621, in full). The act was no doubt a great hardship where it was rigorously enforced, especially amongst the agricultural labourers. Three Devonshire assessments covering a period of 119 years (*vide* Hamilton) indicate a very slow increase, except in the case of indoor servants, while in Bucks the rate of wages for farm labourers in the reign of Anne was no greater than that fixed in Devonshire in the reign of Elizabeth. It may, however, be doubted if the act was on the whole effectual. Prof. Rogers's statistics show that the wages received by the labourers in the main exceeded the rate fixed by the justices, *i.e.* the employers were more merciful than the Quarter Sessions, or (more probably) wages fluctuated in spite of the statutes. The statute continued in force, without substantial modification, until 1825, when it was repealed; but it had been practically a dead letter for many years.

APPROPRIATION. The appropriation of the instruments of production by individuals either singly or in groups, is of great antiquity. Food and other forms of movables seem to have been appropriated prior to land, and though we cannot imagine a time when private property was unknown, there is strong evidence to show that in primitive times the important forms of property were regarded as belonging to the group and not the individual. The Irish early feudal system was, for instance, based on the loan of cattle by the chief to his adherents, the land belonging to the whole tribe. The accumulation of movable property would begin, when once a separate household was acquired by a family, since a house would involve the necessity of some movable articles. When in course of time the relative importance of land and movables altered, land was appropriated by groups of men united by a real or supposed blood relationship. From this collective form of ownership private property in land was slowly evolved (see **PROPERTY**).—Maine's *Early History of Institutions*, London, 1875;—Maine's *Village Communities*, London, 1871;—Laveleye's *Primitive Property*, London, 1878).

The title of modern states to the territories appropriated by them is based either on conquest or on discovery and occupation, confirmed by lapse of time (Wheaton's *Int. Law*, ed. Boyd, London, 1880, c. iv.) It is now admitted that

the high seas, *i.e.* the seas more than 3 miles distant from low water mark, cannot be appropriated either by a state or an individual (*Ib.* p. 251) though the fish in such seas may be taken by capture. As regards the seas within 3 miles of the coast, some writers allow a state jurisdiction only, whilst others assign to it property over such seas (see the various views in Hall's *Int. Law*, Oxford, 1890). From the maxim *cuius est solum eius est usque ad cælum et ad inferos*, it follows that not only mines but even air may be appropriated. Under English law the owner of land as such is entitled to all the light and air that fall perpendicularly on his land. By lapse of time, *i.e.* twenty years, he may also acquire a right to the reception of light and air in a lateral direction, and that either for domestic or trade purposes (Gale on *Easements*, London, 1888).

The extent to which appropriation of natural agents is to be permitted is a matter for state regulation (see **OCCUPATION**, **POSSESSION**, **PROPERTY**).

J. E. C. M.

APPROVED BILL. A bill of exchange to which no reasonable objection can be made.

A PRIORI reasoning is reasoning that starts from general principles, and not from an inductive examination of particular instances. What constitutes the basis of the argument is thus prior to observation or experience of the specific class of phenomena to which the conclusion relates.

RICARDO's ordinary method of reasoning is *a priori*. Thus, in order to show that a tax on raw produce falls on the consumer, he takes for granted the general principles that profits tend to equality, and that the price of raw produce is determined by its cost of production on land that yields no rent. Then, taking the case of produce raised on the margin of cultivation, he argues as follows: "A rise of price is the only means by which the cultivator could pay the tax, and continue to derive the usual and general profits from this employment of his capital. He could not deduct the tax from his rent, and oblige his landlord to pay it, for he pays no rent. He would not deduct it from his profits, for there is no reason why he should continue in an employment which yields small profits, when all other employments are yielding greater. There can then be no question, but that he will have the power of raising the price of raw produce by a sum equal to the tax. A tax on raw produce would not be paid by the landlord; it would not be paid by the farmer; but it would be paid, in an increased price, by the consumer" (*Principles of Political Economy and Taxation*, ch. ix.) It will be seen that this argument does not presuppose any examination of instances in which taxes on raw produce have actually been imposed, or of the consequences observed to result therefrom. According to the school of Ricardo the right method of economic reasoning in general is of the above character; it is *a priori*. The

same view is expressed in Senior's dictum that "political economy depends more on reasoning than on observation."

A priori reasoning is also described as synthetic, and as deductive, the terms used in antithesis being *A POSTERIORI* (*q.v.*), analytical, inductive. For further discussion see ANALYTICAL; DEDUCTIVE; INDUCTIVE; SYNTHETIC METHOD.

J. N. K.

AQUINAS, ST. THOMAS (*b.* 1225, *d.* 1274), the greatest of the schoolmen, is of the utmost importance in the history of economic thought, in that he sums up the teaching of the mediæval church, and at the same time furnishes the point of departure for all subsequent reasoning down to the Renaissance. He would seem, indeed, to have had no special interest in the economic side of life; he was led to handle it partly because his *Summa Theologica* was intended to be encyclopædic, partly because the growth of industry and trade, and the tendency to apply to them the maxims of the CIVIL LAW (*q.v.*), rendered necessary a restatement of Christian principles. Politics and economics were not yet separated from theology; accordingly the utterances of Aquinas on political economy are to be found not in any one place, but scattered up and down his great treatise and his minor writings. It will, however, be convenient to group them under three heads—(i.) fundamental questions of social organisation; (ii.) the ethics of business; (iii.) the theory of taxation.

(i.) The early Christian Fathers had used language which might seem to deny the justice of private property; the canon law had expressly included community of goods among its examples of natural law, and had even incorporated a passage ascribed to Clement of Rome (bishop of Rome in the latter part of the 1st century), wherein it was laid down that the use of all that is in the world ought to be common to all men. Aquinas, with strong common sense, set himself to justify individual ownership without directly taking up a position of antagonism to those earlier ideals. In the first place, he explained away the significance of the generally accepted phrase as to natural law, by drawing a distinction between what was natural absolutely, and what was natural by way of consequence. In the former sense, it was true, there was no reason why a field should belong to one man rather than to another; but in the latter sense such ownership might properly be called natural, considering how necessary it was that the land should be cultivated and that its fruits should be enjoyed in peace. Moreover, argued Aquinas, the phrase did not mean that natural law forbade private property, but only that it did not introduce it; its introduction was due to positive law, the invention of human wisdom. In the second place, he fell back on the teaching of Aristotle—whose *Politics* he was the first of the

schoolmen to incorporate with mediæval thought—and pointed out the beneficial results of private property; and in Aristotle's maxim that property should be *owned* separately but *used* for the common good, he found a distinction which seemed to harmonise with the meaning of the Fathers.

But if the absence of private property was not suitable for society generally, might it not be a duty incumbent on such Christians as sought perfection in the religious life to divest themselves of their wealth? St. Francis had taken poverty for his bride; there was a strong party among the Franciscans who opposed even the corporate holding of property; and the question of apostolic poverty was already beginning to tear the church asunder. Accordingly Aquinas devotes to this topic a more than usually long section. Poverty, he lays down, is not an end in itself, but a means—a means towards following Christ. Riches, therefore, are wrong only so far as they are hindrances in the way of this object. And if external goods are possessed only in such moderate quantities as are necessary for men's due maintenance, they need not distract the soul. If they are the common property of a religious body, the care of them may even be regarded as a work of charity. But in this case the degree in which material goods are desirable, will depend on the character of each particular organisation.

The duty of almsgiving had been closely associated in the teaching of the Fathers with their views as to property; and it had been inculcated without much regard to possible limitations. Here again Aquinas endeavoured to state traditional principles in a more prudent form. The giving of alms was, of course, with him also, a matter of divine command, and not merely a counsel of perfection. But it was to be guided by right reason, according to which men were not bound, unless in exceptional cases, to give more than their superfluity; and superfluity was defined as that which remained after providing for a man's due maintenance, and that of those dependent on him, in the rank of life to which they belonged.

In what to Aristotle was the other great fundamental question, viz. SLAVERY, Aquinas was clearly but little interested, doubtless owing to the changed conditions of society. He nowhere discusses at any length the justice of personal servitude, and his occasional arguments on the subject seem purely academic. He would appear to have accepted Aristotle's view of the expediency of slavery; but he differed from him in believing that by nature (in the "absolute" sense of the term) all men were equal; and he followed some of the Fathers in holding that slavery was among the consequences of the fall of Adam.

(ii.) Of wider practical importance was his teaching as to the ethics of business. He

contributed but little to the development of church doctrine in this regard; but he gave it a systematic shape which greatly strengthened its hold upon men's minds. In laying down that, in buying and selling, nothing but a JUST PRICE (*q.v.*) should ever be demanded or paid, Aquinas was quite conscious that he was enunciating a principle in direct opposition to that of the civil law; and he met the difficulty by urging that human law was necessarily limited, and that it could not, like divine law, prohibit all that was opposed to virtue. As to trade, he agreed with Aristotle that it was base (see ARISTOTLE), and with the Fathers that it was sinful, if carried on for the sake of gain; but it was not sinful when the merchant sought only a moderate reward for his exertions, and spent it in the maintenance of his family or the relief of the poor; still less when it was carried on for the public good, that a country might not be without the necessities of life (see FATHERS). Concerning usury he repeated the arguments of his predecessors Alexander of Hales and Albert the Great, laying particular stress on the distinction between FUNGIBLES and CONSUMPTIBLES (*q.v.*): with the loan of a consumptibile, such as money, passed the right to make use of it, so that to demand the return of the money and a payment for its use was to make a double charge for one thing. He allows, however, that a compensation may justly be received for a DAMNUM EMERGENS (*q.v.*), i.e. the loss arising from the non-restoration of a loan at the appointed time, though not for a LUCRUM CESSANS (*q.v.*) But he makes two dangerous concessions when he allows that a man may, without sin, borrow from one who is already a usurer, if it is for some good object; and that a man may, without sin, entrust his money to a usurer, if the purpose is not gain, but the safe keeping of the money.

(iii.) The treatise *De Regimine Principum*, the most popular manual of statecraft in the later Middle Ages, is, unfortunately, from the hand of Aquinas only as far as the middle of the second chapter of the second book (see PROLEMY OF LUCCA). But there is extant almost interesting letter of his in reply to certain questions of the Duchess of Brabant; among others as to the justice of TAXATION. Aquinas replies that as princes are established by God, not that they may seek their own gain, but the common utility of the people, they should, as a general rule, content themselves with the revenues of their demesne lands. But when these will not suffice for the defence of the country or to meet other emergencies, then it is just that subjects should be called upon to give their aid. This position is identical with the demand, which appears so often in the constitutional struggles of the 14th century in England, that the king should "live of his own."

[There is no adequate account of the economic

teaching of Aquinas, which indeed may be best collected from Aquinas himself. See the *Summa Theologica*, as to *private property*, Secunda Secundæ, Quæstio 77, Articulus 3; Q. 86, Art. 1, 2: as to *voluntary poverty*, Q. 188, Art. 7; as to *alms*, Q. 32, Art. 5, 6; as to *slavery*, Pars Prima, Q. 96, Art. 3; Pars Secundæ, Q. 94, Art. 5; as to *price*, Secunda Secundæ, Q. 77; as to *usury*, Q. 78; as to *taxation*, *De Regimine Judeorum* among the *Opuscula*. The best brief account will be found in C. Jourdain, *La Philosophie de S. Thomas d'Aquin*, 1858. See also W. J. Ashley, *Economic History*, vol. i. pt. i., 1888;—P. Janet, *Histoire de la Science Politique*, 3d ed., 1887;—H. Contzen, *Geschichte der Volkswirtschaftlichen Literatur im Mittelalter*, 2d ed., 1872;—J. J. Baumann, *Die Staatslehre des h. Thomas*, 1873 (little more than a series of extracts in German). For its relation to the teaching of the church in general, W. Endemann, *Studien in der Romanisch-Kanonistischen Wirthschafts u. Rechts-lehre*, vol. i., 1874; vol. ii., 1883; and the brief *Geschichte des Kirchlichen Zinsverbotes* of F. X. Funk, 1876.]

W. J. A.

ARABLE LAND, CONVERSION TO PASTURE IN GREAT BRITAIN. Naturally and historically Great Britain is a grass-growing pastoral country. Nature, by the moist climate, suggests a preponderance of permanent grass-land: history proves that, before the Napoleonic wars and the pressure of scarcity and corn laws, this preponderance in fact existed. But, at the beginning of last century, vast areas of poor soils, of downs, heaths, sheep-walks, and rabbit-warrens, were ploughed up under the temptation of high prices. These tracts cannot now be tilled with profit, nor can many of them be restored to pasture so as to benefit the present generation. Within recent years, the heavy fall in the price of cereals has led to the reconversion of arable land to pasture, and the consequent diminution of the corn-growing area. The increase of permanent pasture has been greatest in grain-growing districts, which are, by climate and by soil, least adapted for pasture, and the economic loss is consequently greater. In 1872 the total acreage of permanent pasture was 12½ million acres; in 1877 it was 13,575,606 acres; in 1887 it was 15,671,395 acres; in 1890 it is over 16 million acres. Bearing in mind the fact that the increase has been greatest in corn-growing districts, it is improbable that the reconverted pastures are really permanent, or that they represent more than a temporary loss of capital. The immediate results of the change are: (1) a considerable reduction in the farmer's labour bill. Assuming that farmers save £1 an acre by the change, more than two millions are annually withdrawn from the wages of the agricultural population. Half the population only is required when dairying replaces tillage, and less than half where neat stock are kept. The full results of the displacement of labour cannot be gauged, partly because the

area over which it extends is wide, partly because agricultural labourers, especially the older generation, remain at their homes, though employment may be precarious, in preference to seeking permanent work elsewhere. The census returns for 1881, compared with those for 1871, show a decrease in the number of agricultural labourers of 91,550. Part of this decrease must be of course attributed to the development of agricultural machinery. (2) A considerable loss in the producing power of the country is, for a time at least, the second result of the conversion. Under favourable circumstances of soil and climate, it takes ten years before a profitable permanent pasture can be obtained. Under unfavourable conditions, the period may be doubled or even trebled. The expense of converting arable land to pasture is greatest where the return is least, and longest postponed. Thus in the moist climate of the west, permanent pasture may be secured by allowing arable land to fall down to grass. In the eastern counties, "tumble-down" land can scarcely ever become profitable pasture. Great care, liberal management, abundance of manure, are necessary. If these are neglected, especially in the third and fourth years from the sowing, the soil will become bare as the desert. On reconverted pasture, the value of the additional sheep, cattle, pigs, hay, and milk will for many years—and the greater the necessary outlay of capital the longer the profits are postponed—fall below the value, even at present prices, of the corn and straw they replace.

[The practical side of the question is treated in all books on agriculture. But see especially the article by Mr. Faunce de Laune of Sharnsted, Sittingbourne, in the *Journal of the Royal Agricultural Society*, pt. 1, 1882, and *Permanent and Temporary Pastures*, by Martin J. Sutton.] A. E. E.

ARBITRAGE (STOCK EXCHANGE). On the stock exchange arbitrage dealings are those which are done by houses in London, for instance, to cover other transactions which may be done in Paris or Berlin or New York or in other distant places. The method pursued is often something like this: The arbitrage dealer learns by telegram from some distant place that his colleagues stationed there have bought or sold certain securities at advantageous prices. His business then is to sell or buy in London if possible at a better price for the same securities. For example, A. sells Egyptian Unified bonds in Paris at a price corresponding to 80 here. B., an arbitrage dealer in London, thereupon endeavours to buy the same amount here at 79½, leaving a profit of ½ per cent to be divided between the two firms. Or C. buys in New York Erie Railroad shares at 23½, and seeks to improve his bargain by instructing D., his colleague in arbitrage business, to sell the same number of shares at 30 here if possible. The nicest attention to the rate of exchange, cost of transit,

insurance, loss of interest, etc., must be given to these transactions. Arbitrage is also conducted, under the title of "shunting," between London and Liverpool, or Manchester, or Glasgow, as the case may be, the favourite operations between these markets being English railway stocks, which are dealt in indifferently in each. A. E.

ARBITRAGE (GENERAL BUSINESS). An expression used in general business language for international dealings in stock exchange securities, bullion, specie, bills of exchange, etc. If the price of a security is higher in one place than in another, it is said that there is a margin between the two places in the particular security, and arbitrage dealers, whenever they discover such a margin, take advantage of it by effecting purchases in the cheaper, and sales in the dearer market. As one of the two operations must precede the other, the margin may disappear before the transaction is completed; but this is not the only element of uncertainty. The original arbitrage transaction always involves a covering transaction to reimburse the buyer for his outlay. The reimbursement can be effected either by a reversed buying and selling of some other security, or by the remittance of bills of exchange from the seller to the buyer, or by the issuing of a draft on the seller by the buyer. The first operation may not always be possible without loss, and the second and third may be disturbed by an unfavourable fluctuation in the rate of exchange. The original margin ought to be wide enough to cover all these risks as well as the outlay for carriage, insurance, bill stamps, security stamps, brokerage, etc. In some cases it may be advisable, instead of forwarding the securities, to continue the bargains on each side until the margin is reversed, and then to close the transaction by buying in the place where the first sale took place and by selling in the place where the first purchase took place. In this way all the forwarding expenses and stamps are saved on both transactions, but there must, of course, be a reasonable prospect of such a reversal in the margin within a measurable time, and there must be no unfavourable difference between the rates of continuation in the two places (as to rates of CONTINUATION, see CONTANGO). As whenever there is a margin in any security all arbitrage dealers buy in the one place and sell in the other, the price in the cheaper place necessarily rises almost immediately, and in the same way the price in the dearer place falls, and as, moreover, for various reasons, which it would not be possible to explain in a short space, arbitrage operations are frequently effected with a very slight, or even without, margin, the natural effect of arbitrage business is to maintain the prices of securities in all places on the same level. E. S.

ARBITRAGE (EXCHANGE). The difference in the rates of exchange (i.e. the prices payable

for bills of exchange on foreign countries) in different places occasions the so-called "arbitrage transactions in exchange." If, for instance, bills on demand on Berlin can be bought in London at 20'40, and bills on London can be bought in Berlin at 20'35, it will be profitable for a Berlin banker to buy the latter and to obtain in exchange bills on Berlin. For every £1000 on London which he buys he has in that case to pay 20,350 marks, while the same £1000 in London will enable him to purchase 20,400 marks on Berlin; he therefore receives 50 marks more than he spent, from which sum, however, the expenses for postage, bill stamps, brokerage, etc., must be deducted. In the case of long bills, allowance must also be made for the rates of discount on both sides. These transactions become more complicated if a bill on a third place is remitted from one of the two places—if, for instance, the Berlin banker, instead of obtaining a bill on Berlin in London in exchange for the bill on London remitted by him, instructs his correspondent to send a bill on St. Petersburg; in such a case there is more risk of loss involved, as, before the St. Petersburg bill is received in Berlin and negotiated there the exchange may vary to the disadvantage of the transaction. The competition of arbitrage dealers naturally reduces the margins of profit, and the consequence is that the rates of exchange in all important centres very nearly correspond with each other.

E. S.

ARBITRATION BETWEEN EMPLOYERS AND EMPLOYED. A system of adjusting industrial disputes. It should not be identified with conciliation (see **CONCILIATION, BOARDS OR**), although a hard and fast line of distinction cannot be drawn. Arbitration may, perhaps, be said to be adapted to a more advanced stage of a dispute, and to be more compulsory in character. If the representatives of employers and employed at a board of conciliation cannot arrive at a mutual agreement, they may refer—and definite provision is generally made for such ultimate reference—to an arbitrator. Arbitration may also be found possible where there is no board of conciliation established, and has sometimes paved the way for the institution of such a board. The details of arbitration are subject to great variation. The arbitrator may be an outsider, or he may be himself a member of the trade in which he is called upon to arbitrate. The advantage of the former alternative is the avoidance of suspicions of bias which may naturally arise in the latter case; but one disadvantage is the necessity of acquainting the arbitrator with the meaning of those technical terms which would be familiar to a member of the trade. In some cases the attempt is made to avoid these difficulties by the appointment on either side of an arbitrator who is a member of the trade, and by the selection, in addition, of a

single umpire who is an outsider invested with the power of final decision should the arbitrators disagree. The questions referred to an arbitrator may also be various, but, in the generality of cases, they are concerned with the regulation of wages. The procedure pursued, again, is subject to variation, but is usually of the following nature. The arbitrator holds a court, as it is termed, on a fixed day. Some time before he is furnished with statements from both the contending parties, setting forth their rival claims and the arguments on which they are based. On the day when the court sits representatives of both sides attend and state their case, sometimes by means of printed or written documents, sometimes supplementing these by, or substituting for them, oral pleadings. The arbitrator asks for any additional evidence he may consider necessary, and makes his award either at once or at a subsequent date. The difficulties connected with industrial arbitration may be summarised under three heads. The award may be disregarded, and to avoid this some writers have urged that a legal character should be given to courts of arbitration, and a legal sanction to the awards of arbitrators. Others have contended that this would tend to impart too elaborate and technical a character to the proceedings, and that it is not in harmony with English traditions or inclinations. They have also pointed to the fact that there is already provision in the statute book for legalised arbitration, *e.g.* (1) a series of acts passed in the 18th century, providing for the settlement of disputes in particular trades, and consolidated in 5 Geo. IV. c. 96; (2) Lord St. Leonard's Act of 1867 (30 & 31 Vict. c. 105), providing for the establishment of councils of conciliation after the model of the French *conseils de prud'hommes* (see **CONSEILS DE PRUD'HOMMES**); and (3) Mr. Mundella's Arbitration Act of 1872 (35 & 36 Vict. c. 46), and that this legislation has hitherto proved inoperative. And therefore, they contend, the only satisfactory means of avoiding the difficulty is to secure thorough representation of the contending parties by means of **TRADES UNIONS AND MASTERS' ASSOCIATIONS** (which see). The second difficulty connected with arbitration is the element of contentiousness naturally attaching to the proceedings, which are, however, often, if not generally, conducted with remarkable courtesy. The third and last, and perhaps the crucial, difficulty is that of securing accurate data for the arbitrator, and of determining the principle on which his award should be based—whether, that is, decisions as to changes in wages should rest on changes in the prices of the articles produced by the wage earners, or on changes in the cost of the raw material, or on these or other circumstances combined (see **COMPETITION**).

[For an account of these difficulties see Price's *Industrial Peace*, ch. iii., where a history is

given of the board of conciliation and arbitration in the manufactured iron trade of the north of England, and Professor Marshall's preface to the same work.—Consult also Jevons's *The State in Relation to Labour*, ch. vii.—Marshall's *Economics of Industry*, bk. iii. ch. viii.—Howell's *Conflicts of Capital and Labour*, ch. xi. part ii.;—and for the difficulty of determining the principle on which the award should be based, Sidgwick's *Principles of Political Economy*, 2d ed., bk. ii. ch. x. § 5, and bk. iii. ch. vii. § 7, and Price's *Paper on Sliding Scales and Economic Theory* (*British Association Report*, 1889, pp. 523-35)—Crompton's *Industrial Conciliation* contains a good account of experiments in arbitration and conciliation, but is now out of print.] L. L. P.

ARBITRATION, SCOTCH. The principal distinctive features are: (1) the arbiter's award ("decreet-arbital") can only be set aside by an action of reduction on the ground of bribery, corruption, or falsehood; (2) the arbiter has implied power to give costs; (3) the decree is attested and executed in the form of a regular deed; it is transcribed in the public registers, and gives warrant for execution issuing against either party. A. D.

ARBUTHNOT, JOHN, M.D., born 1667; died 27th February 1734-35; he was appointed physician to Queen Anne; founded the Scriblerus Club with Swift, Pope, Gay, and Parnell; wrote some witty political satires, a few professional papers, and the following important work.

Tables of the Grecian, Roman, and Jewish Measures, Weights, and Coins reduced to the English Standard, London [1705], 8vo, reprinted as *Tables of Ancient Coins, Weights, and Measures, Explained and Exemplified* [published by his son Charles], London, 1727, 4to.—*Second Edition, with Appendix, containing Observations*, by B. Langwith, D.D., London, 1754, 4to (Latin translation by D. König, Lugd. Bat., 1764, 4to). H. R. T.

ARBUTHNOT, JOHN, of Mitcham (Surrey), towards the end of 18th century, whose abilities as a farmer have been acknowledged by Arthur Young (*On the Husbandry of three celebrated British Farmers*, 1811, pp. 17-28), refutes, in *An Inquiry into the Connection between the present Price of Provisions, and the Size of Farms, etc.*, By a Farmer, 1773, the views of authors ascribing the high price of provisions to large farms, asserts that the proportion of land which is in some degree governed by its value should be equal to a given capital (p. 35), and ascribes the dearthness to failures of crops, luxury in the mode of living, and the increase of post-horses. The remedy consisting in the extension and improvement of agriculture, he recommends enclosures. Then "make the trade free . . . let corn flow like water, and it will find its level" (p. 88). Even the bounty on its exportation is needless. The effects of importation from America are not dangerous, "for there labour is dear." He laments only that the

development of large farms was accompanied by "the loss of our yeomanry, that set of men who really kept up the independence of this nation; and sorry I am to see their lands now in the hands of monopolising lords, tenanted out to small farmers, who hold their leases on such conditions as to be little better than vassals ready to attend a summons on every mischievous occasion," p. 139 (see YEOMEN).

This work has been translated into French by Fréville, 1775, as the second volume of his *Arithmétique politique de A. Young*.—See M'Culloch, *The Literature of Political Economy*, pp. 193, 194.—K. Marx, *Capital*, vol. ii. pp. 746 note 2, 751 note 1. S. B.

ARCO, GHERARDO GIAMBATTISTA DEI CONTI D'ARCO, born at Arco in the Tyrol 1739, died at Goito 1791, was a great personal friend of CONDILLAC. As an economist he was a man of sound common sense, possessing no brilliant talent. His writings, consisting mostly of prize essays written for academies, have been collected by CUSTODI in his *Economisti classici Italiani*, 1804, Milano. His principal essays are dated as follows:

On the Political and Economical Harmony between Towns and Country, 1771 (Mantua Academy).—*On Corn Stores*, 1775 (Mantua Academy).—*On the Influence Commerce exerts over Talents and Habits*, published in 1782 (written in 1777 for the Academy of Marseilles).—*On the Influence the Spirit of Commerce exerts on the Domestic Economy of the People and on the prosperity of States*, 1778 (published in Cremona).—*Reply to the Question whether Agriculture or Industry is to be preferred in a fertile Country*, 1780 (Mantua Academy).—*On the Liberty of Transit Commerce*, 1784 (published in Mantua). M. P.

ARGENSON, RENÉ LOUIS DE VOYER DE PAULMY, Marquis d', born 1694, died 1757; was the eldest son of the "Garde des sceaux" of the same name, under the Regency. He is better known by his celebrated *mot* "*Pas trop gouverner*,"—lineal ancestor in the spirit of the "*laissez-faire, laissez-passer*" of GOURNAY,—than by his works, now little read. His *Considérations sur le gouvernement ancien et présent de la France* (published 1764, but written more than thirty years previously), in which he treats of democracy in a state governed by a monarch, deserves, however, to be reprinted. He was one of the most active members of the *Club de l'Entre-sol* (Place Vendôme), which was founded in 1724, and closed in 1731 by order of Cardinal de Fleury. A. C. F.

ARGENTARIII. The bankers of ancient Rome. There were some special rules regarding their transactions. An action of a special kind could, for instance, be brought against an argentarius who had engaged to answer for the debt of another. The argentarii had special privileges as regards the right of set-off. E. S.

ARISTOCRACY. Aristocracy meant to the Greeks "government by those who are best,"

in other words not government by one individual (monarchy), or by the majority (democracy), but by a select class, who are privileged because of some real or alleged superiority to the rest. Government by a class, if it possessed no such superiority, was not aristocracy but oligarchy (government of the few). Such are in the main the distinctions of ARISTOTLE (*Politics*). Aristocracy, however, has come to mean in our own day simply that class in society which is, or claims to be, superior to the rest, with or without any special power in the government. Historically, therefore, there have been as many forms of aristocracy as there are forms of excellence amongst men. There were aristocracies built on a superiority of race and birth, aristocracies of culture (such as a caste of priests); aristocracies of age and experience (*senatus*, *γερουσία*); military aristocracies, territorial aristocracies (of proprietors of land), and finally aristocracies of wealth (*equites*, merchant princes). It is of the last that Cicero recorded his opinion: "Nec ulla deformior species est civitatis quam illa in quâ opulentissimi optimi putantur" (*Rep.* I. 34). The popular notion of aristocracy changes with the popular standard of excellence; and the changes have clearly been, on the whole, for the benefit of civilisation. Between the actual equality of men in barbarous societies, and the endeavour after equality in the most civilised, there are intervening stages where society is necessarily composed of privileged and unprivileged classes. The relative justification of slavery, for example, lies in the sparing of the conquered, the training of them to habits of industry, and the securing to their masters of the leisure for the acquisition of science and culture. But if these were the conditions of the beginning of progress, they are not necessarily the conditions of its continuance.

In the same way an aristocracy of birth has been the means of reducing a people to military and political discipline, as in the Roman republic and mediæval Europe. The republic of Venice grew strong and wealthy under a governing council filled entirely by sons of office-holders. But the lessons once learnt, the teachers are dismissed. In Venice, *e.g.*, the closing of the *Libro d'oro* in 1309 was the suicide of the governing class. In modern times the two types of most importance in economical and social development have been the territorial and the commercial aristocracies. The aristocracy of feudalism became territorial when the reward of victory was the grant of lands. Land was in those times "the means not of subsistence merely, but of power and protection." Such customs as PRIMOGENITURE and ENTAIL preserved the estate to the lord's family; to divide the land would have been to lessen the power. But by thus endeavouring to maintain their own power, the lords were giving security of person to their dependants, and to their country

a continuity and stability of institutions which every country in Europe needed above everything in those times. In addition they introduced a rule of conduct (*noblesse oblige*) which had in many ways a real superiority to that of common folk. Nevertheless the growth of absolute monarchies, of towns, guilds, and commerce, not only made the feudal institutions unnecessary as guarantees of stability, but revealed the fact that they might be hindrances to progress. Economical causes worked, among others, to free the dependants and to raise up formidable rivals to the power of the nobles. Politically their exclusive privileges may be said to have lasted in France till the Revolution of 1789. In England territorial nobles tempered the hostility of the merchant princes by admitting many of the latter from time to time within their ranks; and they thus saved their privileges for another half century. The aristocracy of wealth, which at first rivalled and then conquered the aristocracy of birth in England, will no doubt give place in its turn to a successor when its work is done. It is of a nature to invite the odium of those who are excluded from it, in proportion as fortunes seem to be due to chance and speculation more than to industry and talent. The recognition of its superiority is often the confession of weakness in presence of strength rather than reverence before admitted excellence. The latter feeling is not only consistent with modern democracy, but is an imperative condition of its health. Democracy claims a fair field for the exercise of all the powers of men, and anything like a hereditary caste of privileged persons would never be willingly created, and is very reluctantly maintained by it. But it recognises an inequality of ability, an aristocracy of genius, and an aristocracy of labour. The differences in talent between individuals, and the effect of heredity in intensifying them, will remain a constant factor of economical and social development (see also EQUALITY, FEUDAL SYSTEM, HEREDITY, INHERITANCE).

[Bluntschli, *Staatslehre*, II. x. and VI. xix. (1875).—Stahl, *Philosophie des Rechts*, vol. ii. p. 103, *Der Adel* (1878).—Ad. Smith, *Wealth of Nations*, bk. iii.—G. C. Lewis, *Use and Abuse of Political Terms*, § 8 (1832).—Montesquieu, *Esprit des Lois*, II. iii., III. iv.] J. B.

ARISTOTLE. By *Æconomic* (οἰκονομική) Aristotle meant the practical science, or art, of household management—practical wisdom (φρόνησις) applied to the household (*Eth. Nic.* VI. 8 § 3), the household (οἶκος) including the three relations of husband and wife, father and child, master and slave, and obviously requiring property for its maintenance (*Pol.* I. 2). The two disconnected books called *The Economics*, which have come down to us among Aristotle's writings, are certainly not his, but works of the Peripatetic school, the first being earlier and of

more value than the second (Zeller, *Phil. der Griechen*, Ed. 3, Theil II., Abtheil. II. p. 944). The first book of the *Politics* constitutes his own contribution to the subject (cp. *Pol.* I. 3, § 1; and III. 6, § 3), and is, indeed, summarised under the title of *περὶ τοῦ οἰκονομικοῦ*, i.e. *Concerning the Economist*, in the epitome by Areius Didymus (?) preserved in Stobæus (*Ecl.* II. c. 6).

Χρηματιστική, the science or art of wealth, is, he tells us, by some considered identical with household management, by some regarded as the most important part of it (*Pol.* I. 3, § 3). He treats of it in chaps. 8-11; and in these chapters, taken along with *Eth. Nic.* V. 5, §§ 6-16, we have what would now be called the "political economy" of Aristotle. Both households and states require means for their support. WEALTH (*πλοῦτος*) is, therefore, defined as "a quantity of instruments for the household or state" (*Pol.* I. 8, § 15). This definition MILL (*Pol. Econ.* "Preliminary Remarks") would consider "philosophically correct," though like other English economists he prefers to define wealth in terms of EXCHANGE. In *Eth. Nic.* IV. 1, § 2, Aristotle defines, or rather describes, property (*Χρήματα*) as "everything whose value is measured by money;" but the more scientific definition of the *Politics* serves him as a basis for his opinion about the true relation of *χρηματιστική* to *οικονομική* and *πολιτική* (as we should say "of economics to politics"). A science of instruments or means is obviously subordinate to a science of ends.

Aristotle uses *χρηματιστική* in the widest sense as equivalent to *κτητική*, the art of acquisition in general; but in a narrower sense it is limited to the art of acquiring that wealth which is only rendered possible by exchange and, on any considerable scale, by MONEY. The kinds of acquisition are distinguished as "natural" and "unnatural," the latter arising through the introduction of exchange. "Natural" wealth is to the household just what nature's provision of food is to animals, e.g. mother's milk to the young, or its ordinary food to the graminivorous or carnivorous animal. And so hunting, either of wild animals for their flesh or skins (fishing would fall under the same head), or of slaves to serve as "living tools," is named among the "natural" modes of acquisition. The "nomadic" life of those who rear sheep and cattle, agriculture (including the cultivation of fruit-trees), the keeping of bees (important when sugar was little known), and the rearing of fowls and fish—all these are considered "natural" ways of supporting life. Intermediate between these and the "unnatural" class, Aristotle places wood-cutting and mining: the man who grows corn is in immediate contact with nature, but the man who makes the spade, or plough, or procures the materials for it, is a step removed from nature—such, at least, seems to be his line of thought. Exchange

(*μεταβλητική*), as already said, introduces the "unnatural" kind of acquisition. Aristotle distinguishes, as Adam SMITH did again long afterwards, between the VALUE possessed by anything in *use* and its value in *exchange* (*Pol.* I. 9, § 2). If a shoe be worn, that is according to nature; if it be used to purchase other commodities, that is not "natural," though still a use of the shoe *quâ* shoe; for the person who takes it in exchange takes it because it is a shoe. Exchange only comes to be needed when we pass outside the limits of the household. In early stages of society, "as among many barbarians still," it took place by simple BARTER (*Pol.* I. 9, § 5). The introduction of money (*νόμισμα*)¹ makes no difference in the character of exchange (*Eth. Nic.* V. 5, § 16), but facilitates it enormously by supplying a measure of value (*πάντα ποιεῖ σύμμετρα*, "it makes all things commensurable," *Eth. Nic.* V. 5, § 15) and a convenient medium of exchange. Money is defined as "a conventional exchangeable representative of demand" (*ὑπάλλαγμα τῆς χρείας κατὰ συνθήκην*, *Eth. Nic.* V. 5, § 11). GOLD and SILVER serve this purpose best; being useful themselves, they are at the same time easily carried about (*Pol.* I. 9, § 8), and, although liable to change in value, they do so less than other commodities (*Eth. Nic.* V. 5, § 14). At first they were always weighed, afterwards a stamp was imposed (*Pol.* I. 9, § 8). This brings out the *conventional* character of CURRENCY, so that a change in the currency will make the old coins useless (*Eth. Nic.* V. 5, § 11). About money there are two opposite errors: (1) that wealth consists in a quantity of money (*Pol.* I. 9, § 10); (2) that it is something utterly valueless—(here he doubtless alludes to Cynic theories, such as are maintained in the pseudo-Platonic *Eryxias*).

The "unnatural" kind of *χρηματιστική* includes (1) Trade (*ἐμπορία*, commerce, and *καπηλική*, retail trade), different forms of which are ship-owning, the carrying-trade, shopkeeping; (2) Money-lending (*τοκισμός*, *ὀβολοστατική*), which is even more unnatural, for it is a perversion even of the natural use of money to make money breed money, instead of simply facilitating exchange; (3) LABOUR for wages (*μισθοπρία*); for while, in Aristotle's view, there are slaves by nature, the hired labourer, whether skilled or unskilled, is something contrary to nature—

¹ A remarkable proof of the force with which this conception has been impressed on modern thought is found in the reference made by MIRABEAU to Aristotle at the session of the National Assembly, 12th December 1790 (see DANA HORTON, *Report on International Monetary Conference*, Paris, 1878, p. 29 (art. BI-METALLISM)).

The same influence is also exemplified in the statement made by recent bi-metallicists, "that the greater part of the value of *νόμισμα* (money) is given it by *νόμος* (law), to which it, as Aristotle says, both etymologically and actually owes its origin" (see letter to the *Times* of Chrysargyros, 20th May 1881), and in the remarks of H. Cernuschi, "Money is instituted by law; *nomos*, law; *nomisma*, money" in his work, *Bi-metallicism as a necessity of the Continent, for the United States, for England*, by H. Cernuschi, London, P. S. King, 1881.

something for which he can find no proper place in his political ideal. Regarding wealth as an *instrument* to life, and therefore as a means and not as an end, Aristotle rejects the money-making life as one that no rational man would choose (*Eth. Nic.* I. 5, § 8, ὁ δὲ χρηματιστὴς [sc. βλος], βλαβὸς τὴς ἐστίν, "The money-making life is" either "unnatural" or rather "chosen only under compulsion," "as a mere necessary"—a passage of which the mistranslation, "The money-maker is a violent person," determined the position of the users in Dante's *Inferno*, canto xi.) But is Aristotle quite consistent in holding, as he does, that the city state is "prior by nature," and so higher in type, than the village community or patriarchal family, and yet condemning as unnatural all the more complex economic conditions of city civilisation? His economic views are really dependent on the ethical principle that conduct (πρᾶξις), and not the production of commodities (ποιήσις), is the end for man. This and the prejudices of a slave-holding society prevented him, perhaps, from sufficiently understanding the economic structure even of the very society in which he was living.

To return to the original question, his answer is that only the natural kind of χρηματιστική is a part of household management. The other kind is subordinate or subservient (ὑπηρετική, *Pol.* I. 10, § 3); and, because concerned with mere means and instruments of living, both kinds are to be pursued only to a limited degree. Thus those are wrong who identify household management with amassing wealth, and statesmanship with finance.

While thus laying the foundations of a special science of wealth, Aristotle never treats the subject apart from ethical and political considerations. In *Eth. Nic.* V. 5, he seems to consider that the value of commodities is, in some way, determined by the value of the producers. Fair exchange is reciprocal action regulated by proportion (τὸ ἀντιπεπονηθὸς κατ' ἀναλογίαν), e.g. as the farmer to the shoemaker, so must be the quantity of shoes that the farmer receives to the quantity of corn that the shoemaker receives. Money, as already said, makes commensurability and so equalisation possible between such incommensurable quantities. We may perhaps make his idea intelligible to ourselves by thinking of the amounts to be given in exchange as in the *inverse ratio* to the value of an hour's labour of each producer.

Aristotle was fully alive to the close relation between social or political institutions and economic conditions. In *Pol.* I. 8, he points out that, just as the food of animals determines their habits as gregarious or solitary, etc., so are men's lives different in the pastoral, the hunting and fishing, and the agricultural stage (or in various combinations of these). The pastoral is here placed first, not as being the rudest, but as

that which leaves most leisure. And so in *Pol.* VI. (= VII. in the changed order of St. Hilaire, etc.) 4, when grouping the different types of democracy according to economic conditions, he considers a pastoral democracy less stable than an agricultural, because there is more leisure for political interests; while, again, an industrial population, living in a city, develops the most extreme form of democracy.

COLONIES are referred to as a remedy for over-population (VI. 5, § 9). The nature of a MONOPOLY (with the use of this term) is illustrated in I. 11. In criticising Plato's COMMUNISM Aristotle uses the argument, often repeated since, that "the magic of property" is needed to ensure due care of anything. Not abolition of all private property, but equalisation of property among the free citizens, along with the maintenance of a nearly equal population, constitutes his own ideal state on its economic side (*Pol.* VII. = IV. in order of St. Hilaire, etc.)

Most of Aristotle's economic discoveries may be said to have lain dormant, and to have required rediscovery in modern times. His influence, however, was directly exercised as one of the factors in the mediæval abhorrence of usury (cp. Ashley, *English Economic History*, I. pp. 145, 152. See CANON LAW; USURY).

[Newman, *The Politics of Aristotle* (Oxf. 1887), i. pp. 125-138; ii. pp. 165-208.—Jowett, *The Politics of Aristotle* (Oxf. 1885), vol. ii. pp. 24-37, especially p. 35, where will be found a convenient table of the various divisions of κτητική, which we are permitted to reproduce here in English:—

The art of acquisition (κτητική: but χρηματιστική is sometimes used in this wide sense).

1. Hunting (a) of wild beasts (b) of those who are "by nature slaves."
2. χρηματιστική (c. 9, § 1), the science or art of wealth.
 - (1) Natural, including
 - (a) keeping of cattle, flocks, etc.
 - (b) agriculture (including cultivation of fruit trees).
 - (c) bee-keeping.
 - (d) keeping of fish.
 - (e) keeping of birds.
 - (2) Intermediate,
 - (a) wood-cutting.
 - (b) mining.
 - (3) Unnatural (= μεταβλητική, exchange).
 - (a) trade (commerce and retail trade).
 - 1st, ship-owning.
 - 2d, carrying-trade.
 - 3d, shopkeeping.
 - (b) money-lending (usury).
 - (c) labour for hire.
 - 1st, of the skilled artisan.
 - 2d, of the unskilled.] D. G. R.

ARITHMETIC, POLITICAL. Economic inquiry was sometimes styled thus during the early development of the study of economics, the best known example being found in the works of Sir William PETTY, who, writing in the latter half of the 17th century, speaks of

the mode in which he conducted his economic investigations—a mode which later inquirers have scarcely been able to improve on—thus: “The Method I take to do this, is not yet very usual; for instead of using only comparative and superlative Words, and intellectual Arguments, I have taken the Course (as a Specimen of the Political Arithmetick I have long aimed at) to express myself in Terms of *Number, Weight, or Measure*; to use only Arguments of Sense, and to consider only such Causes, as have visible Foundations in Nature; leaving those that depend upon the mutable Minds, Opinions, Appetites, and Passions of particular Men, to the Consideration of others: Really professing myself as unable to speak satisfactorily upon those Grounds (if they may be called Grounds,) as to foretell the Cast of a Dye; to play well at Tennis, Billiards, or Bowls (without long Practice,) by Virtue of the most elaborate Conceptions that have ever been written *De Projectilibus et Missilibus*, or of the Angles of Incidence and Reflection” (p. 98).

Several Essays in Political Arithmetick, by Sir William Petty, London (Fourth edition), 1755.

ARITHMETIC, POLITICAL. HISTORY OF. The name of this mother science, both of statistics and of political economy in England can be traced to Sir William PETTY's *Discourse made before the Royal Society the 26th of November 1674, Concerning the use of duplicate proportions in sundry important particulars*, London, 1674 (the Epistle Dedicatory to His Grace William, Lord Duke of Newcastle). “There is,” he says, “a *political arithmetic* and a *geometrical justice* to be yet further cultivated in the world; the errors and defects whereof neither wit, rhetoric, nor interest can more than palliate, never cure. For falsity, disproportion, and inconsistency cannot be rectified by any sermocinations, though made all of figurate and measured periods, pronounced in tune and cadence, through the most advantageous organs; much less by grandisonous or euphonical nonsense farded with formality; no more than vicious wines can be remedied with brandy and honey, or ill cookery with enormous proportions of spice and sugar: *Nam Res nolunt malè administrari.*” Besides the founder of this new science other eminent British writers laboured on the subject of “political arithmetic,” desiring to supply by its means solid arguments in favour of the economical superiority of the nation. They extended the field of investigation to the extent and productiveness of land and population, considering them to be the real sources of national riches. These computations could be no more than estimates of complex facts of political interest, starting from the most typical and calculable instances. Though Adam SMITH confesses not to have great faith in political arithmetic (*Wealth of Nations*, bk. iv. ch. v.), its conclusions have

often been affirmed by later investigations and its methods followed by modern statisticians.

This method is exemplified by the *Natural and Political Observations mentioned in a following Index and made upon the Bills of Mortality*, By John GRAUNT, citizen of London, *With Reference to the Government, Religion, Trade, Growth, Ayer, Diseases, and the several changes of the said City*. London, 1662. By an ingenious analysis of the bills of mortality (after 1603), Graunt constructed a rude statistical statement of births, deaths, and disease, the very beginnings of vital statistics.

Sir W. Petty used political arithmetic to inquire into the wealth of the nation, taking sometimes the annual consumption, sometimes the poll and other taxes as basis. His followers were Gregory KING (1696), whose name is connected with the laws of prices; Ch. DAVENANT (1656-1714), Erasmus PHILIPS (1725), A. HOOKE (1750), Mitchill (1767), Pulteney (1779), Arthur YOUNG in the second part of his *Political Arithmetick* (1779), the first being a treatise on agricultural politics (1774), and G. CHALMERS (1783, 1812). Decaying since Davenant, this branch of political arithmetic reached its end with the inquiries founded upon the new income tax [introduced in 1843]; H. BEEKE (1800); W. PLAYFAIR (1801, author of a *Breviary* showing on a principle entirely new the resources of every state and kingdom in Europe), London, 1801, and P. COLQUHOUN (1815), still professing the old method.

In France VAUBAN, *Dixme Royale* (1707), and later on QUESNAY and MIRABEAU (1760), LAVOISIER (1791), and LAGRANGE (1796) tried to calculate the production and consumption and revenue of their nation, relying on the doctrines known under the title of AGRICULTURAL SYSTEMS (q.v.).

To the inquiries into the number of population and its increase, about which numerous controversies had taken place (Hume v. Wallace, Temple v. Bell, Howlett v. Price, and at last Malthus v. Godwin), the census of 1801 put an end. The inquiries on the movement of population were continued and developed in the most remarkable manner by E. HALLEY, *An Estimate of the Degrees of Mortality*, 1693. He gave the first exact account of the chances of life and hints as to its application to insurances and annuities on lives. His followers in England were Derham (1713), De MOIVRE (1725), SHORT (1750), Simpson (1742), HODGSON (1747), Brakenridge (1755), PRICE (1771), HEYSHAM (1797);—see C. Walford, *The Insurance Cyclopaedia*, vol. i., Annuities on Lives and Bills of Mortality. This branch of political arithmetic, concerning insurance calculations, has survived the others and is sometimes still called by its old name.

Following this line of inquiry, W. KERSSERBOOM (1777) in Holland, A. DEPARCIEUX (1746) in

France, Wargentin (1754-1767) in Sweden, inquired into the average probabilities of life. The most systematic of this series of writers is John Peter SÜSSMILCH (*Göttliche Ordnung*, 1741, 4th ed., 1775). Taking the regularity of the phenomena of mortality and conjugal fertility, as well as that of the rarest events of life for a proof of divine interference, his work became the forerunner of MALTHUS's theory of population as well as of QUETELET's moral statistics.

It is besides worth notice that modern DEMOGRAPHY (*q.v.*) comprehends nearly the same domain of statistical inquiry which was originally cultivated by political arithmetic; it deals with the numerical apprehension of facts "concerning trade and government, others concerning the air, countries, seasons, fruitfulness, health, diseases, longevity, and the proportions between the sex, of ages of mankind" (John Graunt, *Natural and Political Observations*, 1662. The Epistle Dedicatory).

[See Davenant, *Of the use of Political Arithmetic* (1698); *Works*, vol. i. p. 128.—Melon, *Essai politique sur le commerce*, 2d. ed. 1736, ch. xxiv.—Egerton Brydges, *Censura Literaria*, 1805, vol. i. pp. 59-79.—Ingram, *History of Political Economy*, p. 51.—John, *Geschichte der Statistik*, pp. 155-273.—Meitzen, *Geschichte, Theorie, und Technik der Statistik*, pp. 15-181.—J. Giffen, *The Growth of Capital*, 1890.—Gabaglio, *Storia e teoria generale della statistica*, 1880.—H. Westergaard, *Die Grundzüge der Theorie der Statistik*, 1890, pp. 253-270.—Farr, *Vital Statistics*, 1885.] s. b.

ARITHMETICAL RATIO OR PROGRESSION. Three or more quantities are in arithmetical progression when they increase or decrease by a common difference, *e.g.* 1, 4, 7, 10, where the common difference is 3; 2, $2\frac{1}{2}$, 3, $3\frac{1}{2}$, where it is $\frac{1}{2}$; and 25, 21, 17, 13, where it is 4. MALTHUS introduced the term into political economy in comparing the possible increase of food with that of population. He thought that after a country was as fully peopled as Great Britain was in 1798, the addition which could be made in the course of any given period, such as twenty-five years, to the normal annual production of food would actually decrease as the annual production of food grew larger. But for the purpose of argument he was willing to suppose that instead of decreasing, the possible periodical addition might remain the same. Under this supposition, if the annual production of food were always increased as much as possible, it would be represented at the end of successive equal intervals of time by quantities in arithmetical progression, or, as Malthus put it, the production of food would increase in an arithmetical ratio. Population, on the other hand, Malthus described as having the capacity and tendency to increase in a GEOMETRICAL RATIO (*q.v.*)

[Todhunter's *Algebra*.—Malthus, *Essay on the Principle of Population*, bk. i. ch. i., and "Population" in the *Encyclopædia Britannica*, 4th ed., Supplement 1824.] E. c.

ARLES OR ARRHES. Earnest-money—money paid on initiation of a bargain to secure its fulfilment.

ARMED NEUTRALITY. The right of neutral states to trade with belligerents was one of the most important questions in the 18th century. According to the policy of the MERCANTILE SYSTEM every power tried to monopolise the trade with its own COLONIES. But in time of war such a monopoly was often rendered impossible, and a belligerent found it necessary to relax its restrictions in order to receive colonial produce in neutral ships. England, in its frequent wars with France, endeavoured to prevent this practice, and acted upon the old-established principle that "the goods of an enemy found on a neutral ship are liable to seizure." The maritime ascendancy of England enabled it to exercise its right of search with an efficiency that was resented by the neutral powers, especially as ports were often declared to be blockaded when there was no sufficient force to close them. In 1780, when France and Spain were supporting the American colonies of Great Britain against the mother country, the northern states, headed by Russia, concluded the Armed Neutrality to protect their interests. The chief principles which they laid down were, that neutral vessels may carry all goods of belligerents which are not contraband of war, and that a BLOCKADE need not be respected unless there are a sufficient number of ships to enforce it. This league was extremely advantageous to the enemies of England, because it protected them from the complete interruption of their commerce which England was endeavouring to bring about. It was only gradually broken up by treaties between England and the various powers (see SEARCH, RIGHT OF).

In 1800, during the war with revolutionary France, the northern states concluded a second Armed Neutrality on the same lines as the league of 1780. England still refused to accept the principles thus laid down, but this time she was able to act with more energy than on the previous occasion. Copenhagen was bombarded and the Danish fleet seized. In 1801 the death of the Czar Paul broke up the Armed Neutrality, and a convention at St. Petersburg fixed limits to the right of search and agreed that a blockade must be efficient to be respected. But the great questions at issue remained unsettled, and to this day the extent to which a belligerent is entitled to damage the trade of its enemy is a subject of discussion.

[Wheaton, *International Law*.—Lecky, *History of England in the 18th Century*.—Alison, *History of Europe*.] R. L.

ARMSTRONG, CLEMENT (an English writer

about 1530) complains of the speculations in wool of merchant staplers, who drive by importations of foreign commodities the money out of the realm and destroy husbandry by converting the cornfields into sheepwalks. He proposes to erect a staple of woollen cloth in London, to restore tillage, and to set people to work, for "the holl welth of the body of the realme risith out of the labours and workes of the common peple" (p. 61). *Sermons and Declaracions agaynst Popish Ceremonies*, reprinted in *Drei volkswirtschaftliche Denkschriften aus der Zeit Heinrichs VIII. von England*. Zum ersten Male herausgegeben von Reinhold Pauli, 23, Bd. Abhandlungen der K. Gesellsch. der Wissenschaften zu Göttingen, 1878.—G. Schanz, *Englische Handelspolitik gegen Ende des Mittelalters*, Bd. i. pp. 83, 475.—Cunningham, *The Growth of English Industry and Commerce*, 1890, p. 292 n. S. B.

ARND, KARL (a German economist), born at Fulda, 1788, was an architect in Hesse, and died, 1877, at Hanau. He was a warm advocate of FREE TRADE and of one SINGLE TAX on rent. He opposed RICARDO's theories and his German followers, as well as Fr. LIST's protectionist views.

Die neuere Güterlehre, 1821.—*Die naturgemässe Volkswirtschaft*, 1845.—*Die Volkswirtschaft, begründet auf und anelbare Naturgesetze*, 1863.—*Die Befreiung der Bodenrente und die Emancipation des Bauernstandes*, 1865.—*Adam Smith's des jüngern Prüfung der heutigen volkswirtschaftlichen Systeme*, 1867; see Roscher, *Geschichte der Nationalökonomik in Deutschland*, p. 500; and *Handwörterbuch der Staatswissenschaften*, herausgegeben von Conrad, Lexis und Loening, 1890, vol. i. p. 931. S. B.

ARNOULD, AMBROISE-MARIE (1750-1812) a French economist, was director of the board of commerce under the revolution. His works contain valuable information upon the theory of trade, the state of the BALANCE OF TRADE in Europe during the 18th century, French finances, etc. He advocated the division of France into departments according to their homogeneous economical nature; and appealed to all maritime nations to confederate against the menacing power of England.

De la Balance du Commerce, 2 vols., 1791.—*Repartition de la contribution foncière*, 1791.—*Système maritime et politique des Européens pendant le 18e. siècle*, 1797.—*Histoire générale des finances de la France*, 1806. S. B.

ARRANGEMENT WITH CREDITORS. See BANKRUPTCY.

ARRANGEMENT, DEED OF. An instrument embodying an agreement between a debtor and the general body of his creditors for the purpose of modifying the debtor's obligations without resorting to bankruptcy proceedings. Some additional security is frequently given in such cases, but the fact of the other creditors foregoing part of their claims, and thus making the debtor's position an easier one, is

considered to be a valid consideration for the indulgence granted by any individual creditor. An arrangement of this nature is, of course, binding on those creditors only who expressly assent to it. The Deed of Arrangement Act 1887 (50 & 51 Vict. c. 57), provides that a deed of arrangement is void unless registered within a given time and stamped with an *ad valorem* stamp. The register is open to the public. The act defines a deed of arrangement so as to include (a) any assignment of property; (b) any agreement for a composition; (c) any deed of inspectorship; (d) any letter of licence to carry on business with a view to the payment of debts; (e) any agreement for the carrying on or winding up a business for the benefit of creditors. E. S.

ARREARS. Sums remaining unpaid after they are due; for example—interest in arrear; arrears of dividend; instalments in arrear; arrears of wages, of rent, etc.; contracts in arrear, etc. Such arrears often involve penalties (see CONTRACT, LAW OF; WAGES).

ARREST. A process of the Admiralty Division of the High Court by which the removal of a ship or cargo pending an action referring to the same is prevented. Certain actions in that Division (called actions *in rem.*) are not brought against a personal defendant, but against a ship or a cargo against which the claim is directed. The owner may, on giving security, prevent the arrest by the entry of a *caveat* (s.v. CAVEAT) or, after the arrest has been effected, obtain a release. E. S.

ARRESTMENT (Scots law). Attachment of debt either before or after judgment.

ARRESTMENT JURISDICTIONIS FUNDANDÆ CAUSA. See JURISDICTION, SCOTCH.

ARRIVABENE, GIOVANNI, Count, born in 1787 in Mantua, died June 1881. Condemned to death for political conspiracy in 1824, he fled abroad. In 1847 he was a promoter of the economical congress of Brussels. His high position amongst political men, and in cultivated society, gave him a standing as an economist which he otherwise would not have held. He was a friend of N. W. SENIOR and translated some of his best writings. Arrivabene's writings were collected in 1870 under the title, *Scritti morali ed economici*, Firenze. A part of his life has been told by himself in *Un'epoca della mia vita, Memorie*, Torino, 1860. The book which first established his credit was written by him in London, *Di varie società e istituzioni di beneficenza in Londra*, 1828, Lugano. M. P.

ART OF POLITICAL ECONOMY. By the majority of English economists for the last half century political economy has been held to be in itself a positive science, concerned exclusively with the investigation of uniformities, and not directly formulating a single practical rule of action. While the knowledge it affords may be turned to practical account by the legislator or

the social reformer, it is described as in itself standing neutral between competing social schemes. In other words, a sharp line of distinction is drawn between economic science, and the application of economic science to practice. A very different view is taken by the majority of continental economists, who, generally speaking, make little attempt to separate theoretical and practical problems. Adequately to treat these problems apart from one another is even maintained to be an impossibility, and hence it is denied that political economy can properly be regarded as a purely positive science. Its primary function, according to this view, is to direct conduct to given ends rather than merely to investigate facts of a given kind.

It has been further maintained that English economists are themselves inconsistent, and that, professing to construct a pure science of economics, they do in fact build up an economic art. It is pointed out, for instance, that nearly the whole of the last book of MILL's political economy is concerned with the discussion of practical questions. It would not be difficult to explain away this apparent inconsistency, so far as our leading economists are themselves concerned; but at the same time it cannot be maintained that the distinction which they profess to draw between political economy and its applications has ever been clearly grasped beyond what may be called the inner circle of their disciples. One consequence of this has been grave misconception as to the true meaning of many of the laws which they have formulated. They have often been understood to prescribe what ought to be, when their sole intention has been to determine what is. Partly to correct this error, and partly for other reasons, it has been proposed explicitly to recognise the twofold aspect of economic inquiry by definitely formulating an economic art as well as an economic science.

[See, in particular, Sidgwick, *Principles of Political Economy*, 1887, p. 395. The art is described by Dr. Sidgwick as consisting mainly of the theory of what ought to be done by government to improve production or distribution, and to provide for governmental expenditure. A similar division of economic doctrine was indicated by Senior, *Political Economy*, Introduction, p. 2 *et seq.*, ed. 1854, and the distinction is also put clearly by Professor Cossa. The latter writer describes the art of political economy as studying economic phenomena with the immediate aim of providing safe rules for administration, or of directing economic institutions, so that they may conduce to the general welfare. Compare, further, Keynes' *Scope and Method of Political Economy*, ch. ii., note B.] J. N. K.

ARTEL (Russian for "gang,") is used specially of the Russian associations of independent workmen undertaking a job in concert and dividing its gains equally. This primitive form of *artel* is still to be found (*e.g.* among the

fishermen of Archangel). But the peasants, at least in the less fertile districts, find greater security in working for a contractor; and the "gangs" so working have no co-operative feature, except occasionally the common purchase of provisions. In towns the *artel* is often simply a trade guild with mutual responsibility; thus that of bank porters is jointly responsible for its several members. Since the Emancipation, 1861, various local councils throughout Russia have tried to establish associations for production, with scant success. The workmen's own attempts have been more fortunate, especially in popular banks. But the new co-operative societies will not be a mere revival of the old *artel*. The industrial village of Struve & Co., engineers (founded 1885), is on the model of Pullman City, U.S. The communism of the sect called Douchobornians differs both from true co-operation and from the old *artel* (see BANKS, POPULAR; CO-OPERATION).

[*Les Artèles et le Mouvement Co-opératif en Russie*, W. Longuinine, (Paris, 1886).—*Russia*, Mackenzie Wallace, ch. vi. (1877).—*Proprieta Capitalista*, Loria (1889), vol. ii. pp. 436-7.—*Political Science Quarterly* (New York), March 1887, —Rabbino, *Le Società Co-operative*, Part I. (Milan, 1889). See too the article by W. Stieda in the *Jahrbücher für Nationalök. und Statist* (Neue Folge), vi. pp. 192-230. The Russian authorities include Isajeff, Kalachoff, Nemiroff, Vreden, Scherbina, and Novoselsky.] J. B.

ARTICLES OF APPRENTICESHIP. Written agreements by which the master promises to instruct, and the apprentice promises to learn and serve. The master frequently receives a premium, which must be set forth as the consideration of the agreement for the purpose of ascertaining the stamp duty. Seven years were formerly the minimum period of apprenticeship, but there is now no fixed period. The master is entitled to all the apprentice's earnings and has certain other rights under the contract notwithstanding the apprentice's infancy, but he cannot bring an action to enforce the covenants of an infant apprentice, and the apprentice may disaffirm the contract on attaining the age of twenty-one. The master's bankruptcy determines the contract. Disputes between masters and apprentices to the business of a workman may be brought before the justices, who may make an order directing the apprentice to perform his duties under the apprenticeship, or may rescind the instrument of APPRENTICESHIP (*q.v.*) (38 & 39 Vict. c. 90, §§ 5-7). E. S.

ARTICLES OF ASSOCIATION contain the regulations concerning the constitution and management of joint-stock companies registered under the Companies Acts. The first schedule of the Companies Act 1862, Table A, contains a set of regulations which may be adopted wholly or in part, and which in the case of a company limited by shares are deemed to be adopted by the company, if the memorandum

of association is not on registration accompanied by articles, or in so far as the articles do not expressly exclude or modify them. In the case of a company limited by guarantee, or of an unlimited company, articles of association *must* always accompany the memorandum. While the MEMORANDUM OF ASSOCIATION cannot be varied even by the unanimous decision of all the shareholders unless such variation is confirmed by the court under the provisions of the act of 1890 (except with regard to the amount and division of the capital), articles of association may be varied by special resolution and the company cannot deprive itself of its power to alter them. In a conflict between the articles and the memorandum the former must give way. Articles of association generally contain most of the following heads: (1) Preliminary (definitions, commencement of business, allotment of shares, etc.), (2) Certificates, (3) Calls, (4) Transfer and Transmission of Shares and Stock, (5) Share Warrants, (6) Forfeiture and Lien, (7) Conversion of Shares into Stock, (8) Increase of Capital, (9) Reduction of Capital, Consolidation and Sub-division of Shares, (10) Surrender of Shares, (11) Borrowing Powers, (12) General Meetings, (13) Votes of Members, (14) Directors (qualification, etc.), (15) Proceedings and Powers of Directors, (16) Officers, (17) Dividends, (18) Accounts and Audit, (19) Notice, (20) Arbitration, (21) Winding up (see COMPANIES, JOINT-STOCK, etc.) E. S.

ARTICLES OF ROUP (Scotch). Conditions of sale by auction.

ARTISAN. An artisan is a person employed in the industrial arts, such as a carpenter or mechanic. It has been suggested that the artisan is distinguished from other labourers by the fact that he works for himself. This, however, is only true of a few remaining village artisans, such as the blacksmith and the carpenter. The early English artisans were few in number. They supplied labour only, their employers finding materials. In course of time they became organised in guilds, at least in the towns (see GUILD). The 15th century saw the rise of the capitalist artisan, but the invention of machinery paved the way for the modern forms of industry under which production is carried on by associated labour working under capitalists. The artisan is now usually a workman employed by others, though in some districts and in some villages a few of the old capitalist artisans still remain.

[*Six Centuries of Work and Wages*, by J. E. T. Rogers, London, 1884.—*Labour in Europe and America*, by Edward Young, Washington, 1870.—*Conflicts of Capital and Labour*, by George Howell, London, 1878 (see LABOUR, SKILLED).]

J. E. C. M.

ARTS AND CRAFTS. See CORPORATIONS OF ARTS AND TRADES.

AS. A Roman coin, of an alloy of copper

and tin called *aes*, of different weights and composition at different times. Originally 1 lb., reduced to 2 oz. after the first Punic War, to 1 oz. during the second Punic War, and finally, by the Papirian Law, to $\frac{1}{2}$ oz. Design: a sheep, (*pecus*, hence the word *pecuniary*), an ox, or a sow.

F. E. A.

ASGILL, JOHN, born at Hanley Castle, Worcestershire, 1659, called to the English bar 1692, expelled from the Irish House of Commons 1703, and from the British Parliament 1707, for an eccentric pamphlet contending that man could be translated to heaven without dying. He left this world in the ordinary way, 1738. He wrote the following economic works.

Several Assertions proved in order to create another Species of Money than Gold and Silver, London, 1696, 8vo (based on the theory "man deals in nothing but earth;" a contemporary pamphlet asserts that it is plagiarised from J. BRISCOE's (q.v.) *Discourse on the Late Funds*, 1694, 4to).—*Essay on a Registry for Titles of Land*, London, 1698, 12mo (4th ed., 1758).—*A Collection of Tracts*, London, 1715, 8 parts, 8vo.—*Abstract of the Publick Funds Granted and Continued to the Crown since 1 W. & M.*, London, 1715, 4to (reprinted in Somers's *Tracts*, 1815, xiii. pp. 730-742).

H. R. T.

ASHBURTON, ALEXANDER BARING, first lord, second son of Sir Francis BARING, was born 1774. He visited America on business connected with his father's firm, the head of which he became in 1810; he was president of the BOARD OF TRADE in 1834, and raised to the peerage in 1835. He concluded the boundary treaty between the United States and England at Washington in 1842, and died 1848. He wrote—

Inquiry into the Causes and Consequences of the Orders in Council and an Examination of the Conduct of Great Britain towards the neutral Commerce of America, London, 1808, 8vo (two editions; opposes restrictions on commerce).—*The Financial and Commercial Crisis Considered*, London, 1847, 8vo (three editions; to show how mischievous at that date was the Bank Charter Act of 1844).

H. R. T.

ASHLEY, JOHN, member of council in Barbadoes, died at Blackheath, Kent, 1751. He wrote—

The Sugar Trade, with the Incumbrances thereon laid open, London, 1734, 8vo.—*Some Observations on a direct Importation of Sugar from the British Islands*, London, 1735, 4to.—*Memoirs and Considerations concerning the Trade and Revenues of the British Colonies in America*, London, 1740-43, 2 parts, 8vo.

H. R. T.

ASSAY. The assay methods for SILVER and GOLD are analogous, in so far that both are purified by the action of a solvent, but the base metals are removed from silver by fused litharge, while in its turn silver is parted from gold by nitric acid.

If the silver has been associated only with readily oxidisable metals, especially copper, as is usually the case when silver coins are

assayed, it then only becomes a question of providing the amount of lead necessary to furnish, by oxidation, sufficient litharge to dissolve the oxides and carry them away. If, however, the silver is associated with gold, the latter metal resists oxidation, and will remain on the cupel with the silver. The cupellation stage must then be supplemented by a "parting" operation, that is, the silver must be dissolved away by some solvent that will leave the gold untouched, and for this purpose nitric acid is universally employed. If the silver contains but a minute particle of gold, the presence of the latter will be indicated by a few specks of brown powder left at the bottom of the vessel in which the silver is dissolved; if, however, the silver contains about one third of its mass of gold, and has been extended into a strip, the gold will remain, after the action of the acid, as a coherent band retaining the original form of the strip but much reduced in volume. There is this difference between the assay of gold and silver. In the case of the cupellation assay of silver, the button of metal has only to be removed from the cupel, and when the adhering bone ash has been removed with a brush, it passes direct to the balance. The process would also be sufficient for gold, if it contained no other precious metal; when, however, the problem is to ascertain by assay how much gold is contained in an alloy, which may contain silver or platinum and other metals of similar properties, then care must be taken that the amount of gold believed to be present in the alloy does not exceed the third part of the mass, as a larger proportion of gold would protect the alloy from the solvent action of the acid, and the greater the amount of gold, the less perfect would be the attack of the acid. The first stage of assaying a gold alloy, say a sovereign, is to melt it with such an amount of silver as shall yield a button containing rather less than one third of its weight of gold. For the sake of convenience and for the incidental advantage that the solvent action of fused litharge removes copper and other impurities, the first stage of the assay of gold is conducted on a cupel, the object to be attained being mainly to secure a button of gold and silver in a convenient form for submitting to the subsequent operations. The alloying stage would, however, be just as effective if it were conducted in a small non-porous receptacle, such as a small crucible of glazed porcelain.

The subsequent operations are, flattening the button, annealing it, rolling it into a strip, and annealing it a second time. It is then coiled into a spiral, or cornet, and treated by two successive portions of nitric acid in order to remove the silver; after this the spiral of spongy gold, which retains the original form

given to the silver-gold alloy, is heated to redness, when it becomes bright, and is sometimes so coherent that it may be unrolled without fracture. The cornet is then weighed on a delicate balance, and its weight, compared with that of the portion of metal taken for assay, affords a means for readily calculating the proportion of precious metal present in the mass assayed (see ALLOY; PERIOT). C. R. A.

ASSESSED TAXES. A group of taxes "on houses, carriages, men-servants, saddle and carriage horses, and race horses" (Dowell, *History of Taxation*, 2d ed. vol. ii. p. 189). These were placed under better supervision by W. PITT, 1785, and were intended to be taxes on "luxuries." Hair powder and armorial bearings were afterwards added. The sporting and dog duties, though not included among assessed taxes, may be considered as of an analogous nature. Some of these taxes, as those on horses and hair powder, have been remitted, but the principle of taxing luxuries has been maintained, though not unfrequently modified, in our fiscal system (see TAXATION, TAXES, etc.)

[Dowell, *History of Taxation and Taxes in England*, 4 vols., 1888, 2d ed.]

ASSESSMENT. The official valuation of income or property for the purposes of taxation. The word is sometimes used in another sense, viz. the amount of a tax a particular person has to pay. It was also applied to certain taxes on lands and goods levied during the commonwealth, and which Dowell (*History of Taxation*, London, 1888, iii. p. 72) says formed the link between the *Subsidy* of the Tudor and earlier Stuarts and the *PROPERTY TAX* of William III. Where a tax has to be levied on property or on income, the amount of such property or income must be ascertained, and this is by no means an easy task. Even then the principles of taxation may require certain allowances to be deducted before the taxable property is ascertained. In some cases the assessors are officials, in other cases they are elected directly or indirectly by those who pay the tax.

1. *Imperial Taxation.*—In the case of imperial taxes, assessment is required for the *LAND TAX*, the inhabited house duty, the income tax, and the *DEATH DUTIES*. The amount of the land tax payable by each parish is fixed by statute, and each parish raises its quota by a rate on the yearly value of all lands and hereditaments. The great increase in the value of land in many parishes has greatly diminished the rate per £ necessary to raise the quota in such parishes (Bourdin's *Land Tax*, by S. Bunbury, London, 1885). Inhabited houses are assessed to the inhabited house duty at the yearly rent they are worth. Where the occupier is also the owner, some difficulty often exists in fixing the yearly value. Perhaps the soundest principle would be to take a certain interest, so much per cent, on the selling value as the estimated

rental (see INHABITED HOUSE DUTY). As regards income tax, income from landed property including houses, is assessed at its rent or annual value, but speaking generally with respect to profits for occupation of land the assessment is one-half the rent in England, and one-third in Scotland and Ireland, subject to rectification if the profits are less. No deduction is allowed on account of repairs. Returns are made by the occupiers, and on such returns the assessment is made. Income derived from public funds or from public offices is assessed at the amount received, and the tax is deducted where possible before the income is paid. Income derived from professions, trades, and other occupations is assessed upon the average profits of the preceding three years, other forms of income are assessed at the amount actually received. Incomes under £150 are exempt, and incomes under £400 are entitled to an abatement of £120 (see INCOME TAX).

2. *Local Taxation.*—Taxes required for local purposes, such as the poor rate, the county rate, the borough rate, are levied upon the full rateable value, with certain exceptions that are based on no definite principle. The assessment for the lighting and watching rate is three times greater on buildings than upon land, certain lands are assessed to the general district rate at one-fourth the rateable value, whilst owners of small tenements, if they compound for the rates, are assessed at one-half the rateable value. The rateable value for the poor rate which is conclusive for the majority of rates, is defined by the 6 & 7 Will. IV. c. 96, as “the net annual value of the several hereditaments rated thereto; that is to say, of the rent at which the same might reasonably be expected to let from year to year free of all usual tenants’ rates and taxes and tithe commutation rent-charge, if any, and deducting therefrom the probable average annual cost of repairs, insurances, and other expenses, if any, necessary to maintain them in a state to command such rent.” The provisions of 6 & 7 Will. IV. c. 96, do not, however, apply to the metropolis. In the metropolis the gross value is taken as the basis of the assessment for the purpose of ascertaining the rateable value, and deductions are made which vary according to the nature of the tenement, a maximum percentage being fixed for the deduction in each case. The maximum deduction is in the case of: Houses and buildings, or either of them, without land other than gardens, when the gross value is

under £20,	25 per cent.
When the gross value is £20 and under £40,	20 „
When the gross value is £40 or upwards,	16 $\frac{2}{3}$ „

(32 & 33 Vict. c. 67, §§ 4, 51, 52, and third schedule). Land occupied by the crown for public purposes, property unoccupied or not

capable of yielding any rent, and personal property, are not rateable. (As to the taxation of ground rents, see GROUND RENT.) The basis of the county rate is ascertained in a similar way, but the assessors are not bound to follow the poor-rate assessment (see COUNTY RATE). By the bill introduced by Mr. Goschen in the House of Commons on the 3d April 1871 it was proposed to render “every hereditament, corporeal or incorporeal,” with the exception of rent-charges, liable to be rated to all local taxes (see *Local Taxation*, by G. J. Goschen, London, 1872; and the Report of the Select Committee of the House of Commons on Local Taxation, 1871).

[On assessment for local taxation see *Local Government and Local Taxation*, by R. S. Wright and H. Hobhouse (London, 1884).—*Law of Rating*, by E. J. Castle (London, 1886).—*Handbook for Council Authorities*, by A. Pulling (London, 1889). (For assessment for general average, see ADJUSTMENT, AVERAGE; AVERAGE, MARITIME).] J. E. C. M.

ASSETS (Lat. *ad satis*; French *assez*); literally, sufficient. Originally the use of the word was confined to property which an executor or heir could apply for the discharge of the debts and legacies due from the estate of a deceased person. These obligations could only be enforced in so far as the property available for that purpose was sufficient. The application of the expression was afterwards extended to the property which could be applied for distribution among the creditors of an insolvent debtor, and in course of time acquired the still wider meaning of any person's property in so far as it could be used for the discharge of his liabilities. The assets remaining after the discharge of liabilities are a person's actual capital.

ASSIENTO TREATY. This treaty requires mention, owing to the connection between it and the development of slavery in North America. In 1713 Spain by agreement (Assiento) conceded to France the privilege of carrying negro slaves to the Spanish colonies. France, by the treaty of Utrecht, surrendered this privilege which, by the treaty de l'Assiento, was granted to England for thirty-three years from the 1st May 1713. England engaged to furnish 4800 slaves annually, and in return was entitled to send two ships every year with negroes to America. The SOUTH SEA COMPANY obtained the benefit of this monopoly. At the outbreak of the war with Spain, the Assiento was suspended, but it was renewed in 1725 and again in 1748.

[The leading clauses are set out in Hosack's *Law of Nations*, London, 1882, p. 355, and are taken from *Actes et Mémoires de la Paix d'Utrecht*. See also *Histoire des Traités de Paix*, par F. Schoell, p. 214 (Brussels, 1837).] J. E. C. M.

ASSIGNAT (from Lat., *Assignatus*). The PAPER MONEY issued by the French republic in 1789-94, in consequence of the scarcity of coin, was termed assignats because it was secured,

not upon coin, but upon crown and church property, in the purchase of which these notes were receivable at par. Each note was of 100 francs (£4), and notes returned to the state in payment of purchase money were to be cancelled. The first issue of 400,000,000 francs carried interest at a daily rate (as exchequer bills did here prior to 1862), but were inconvertible except in payment for property publicly assigned for the purpose. A second issue of 800,000,000 francs carried no interest, and further issues effected rapidly brought the total up to 3,750,000,000 francs, or £150,000,000, nominal. At that time, in August 1793, the depreciation of the assignat had become so great, it being quite impossible for the country properly to absorb this vast amount of paper, that the 100 francs nominal ranked for less than 20 francs coin. Then recourse was had to protective legislation. First, May 1793, a decree was issued that farmers must declare the quantity of corn in their possession, and sell it in recognised markets, no one being permitted to purchase more than sufficient for one month's consumption. Then maximum prices were decreed, and as such laws could not rehabilitate the assignats, a forced loan of 1,000,000,000 francs, and the forced prepayment of taxes, were applied to the reduction of this paper currency. In this way the total was brought down to about 2,500,000,000 francs. But the wants of the government were so pressing that but a few months had elapsed before these notes had been reissued, and a far larger amount followed. In June 1794 the assignats in circulation reached the vast total of 6,536,000,000 francs, or £261,440,000, nominal. The result of legislation then was that the land remained untilled and all business was paralysed. At this time the 100 francs assignat was not worth 1 franc, and though, after the fall of Robespierre, the maximum laws were relaxed, the value of the assignats did not recover. The government and the entire country had been reduced to a state of pauperism, and when, in October 1795, the Directory had been established, the total issue reached 22,000,000,000 francs, or £880,000,000, nominal. Yet in two months another 15,000,000,000 francs were issued, and the depreciation was such that the paper became entirely valueless. Then followed the conversion of the assignats into *mandats* (or warrants) at the thirtieth part of their face value, and these in their turn were returned to the state in 1796 at about the seventieth part of the value of coin. Thiers' *History of the French Revolution* gives a vivid description of this eventful period, and of the disastrous effects of these issues of inconvertible paper.

In Russia in the early part of the present century an issue of paper was made similar in form to the assignats in France and became greatly depreciated. These notes were subsequently to a large extent withdrawn.

Professor F. A. WALKER has in his work on *Money* (ch. xvi.), described the development of the paper issue, and the fruitless opposition of NECKER. It was assumed that the republic could do safely what had been (1719-21) disastrous under the monarchy. "Paper money," it was argued before the assembly, "paper money under a despotism is dangerous, it favours corruption; but in a nation constitutionally governed, which takes care of its own notes, which determines their number and their use, that danger no longer exists." A desire to commit the thrifty middle class of France to the principles and measures of the Revolution for political purposes largely actuated the assembly. This was avowed by Mirabeau, "Partout où se placera un assignat-monnaie, là sûrement posera avec lui un vœu secret pour le crédit des assignats, un désir de leur solidité . . . partout où se trouvera un porteur d'assignats, vous compterez un défenseur nécessaire de vos mesures, un créancier intéressé à vos succès." These notes, the Comte de MIRABEAU continued to declare, could never be issued in excess. "They represent," he said, "real property, the most secure of all possessions, the soil on which we tread." Again, "There cannot be a greater error than the fear so generally prevalent as to the over-issue of assignats. . . . Re-absorbed progressively in the purchase of the national domains, this paper money can never become redundant."

The following table of the depreciation of the assignats, derived from M. Bresson (*Hist. Financière de la France*), shows how entirely Mirabeau's anticipations were falsified by events.

24 livres in coin were worth in assignats—

April 1, 1795 . . . 238	Oct. 1, 1795 . . . 1205
May " " . . . 299	Nov. " " . . . 2588
June " " . . . 439	Dec. " " . . . 3575
July " " . . . 808	Jan. " 1796 . . . 4658
Aug. " " . . . 807	Feb. " " . . . 5337
Sept. " " . . . 1101	

At the last, "an assignat professing to be worth 100 francs was commonly exchanged for 5 sous 6 deniers, in other words, a paper note professing to be worth £4 sterling passed current for less than 3d. in money" (Twiss, *Progress of Political Economy*, p. 263). M. Joseph GARNIER gives (*Traité de Finances*, p. 408), the following statement from a work of M. Ramel, former minister of finance. The figures represent millions of francs.

Assignats créés par l'assemblée constituante (lois des 21st Déc. 1789, 17th Avril 1790, 19th Juin 1790)		1,800
" "	par l'assemblée législative	900
" "	directement par la Convention	7,278
" "	par les Comités autorisés	33,603
" "	par le Directoire	
		<u>43,581</u>

M. Bresson gives a total differing by only two or three millions from the above (see *Money*, by Francis A. WALKER, pp. 336-347, for further details). See CHAMBERLEN, H. ; LAW, J.

ASSIGNATION (Scots law term). Assignment.

ASSIGNEE. One to whom a right or property is transferred. The term "assignee in bankruptcy" is not used under the present bankruptcy law, but there is an "official assignee" on the London stock exchange on whom certain duties devolve in the case of the insolvency of a member.

ASSIGNMENT. The transfer of a right or property. In strict legal phraseology the word is used with reference to personal property only. It is correct to speak of the assignment of a lease, but the term could not be applied to the transfer of freehold property.

ASSIGNMENT, DEED OF. This expression, though it might be used for every deed assigning property, is more specially applied to instruments by which a debtor's property is conveyed or assigned to a trustee for the benefit of his creditors generally. An assignment of this nature is considered an act of bankruptcy (Bankruptcy Act 1883, § 4 (a)). E. S.

ASSIGNOR. One who transfers a right or property.

ASSIZE OF BREAD AND BEER. In the collection of ancient acts of parliament, two are always cited as of indefinite antiquity, neither reign nor date in which they were first enacted or promulgated being given, or indeed discoverable. These are the statute on weights and measures, and the assize of bread and beer. It is highly probable that these statutes are declaratory of very ancient custom, and were necessarily reduced to a form because they each represent rules exhibited in figures. They are constantly copied in those legal handy books which lawyers possessed and referred to, and of which some still survive, dating occasionally from the 13th century. It was at first the duty of the local court (that of the MANOR), to enforce the assize, and the records of those courts contain frequent entries of fines levied on those offenders who had broken the assize.

The assize of bread and beer is drawn up in the form of a sliding scale, the price of the unit (in bread, the weight of the unit) varying with the price of grain by the quarter, wheat and malt as the case may be, information as to the price having been easily procurable from market rates. The scale of prices goes beyond recorded experience of cheapness or dearness, at least as far as the writer has registered prices. The assize was therefore a regulation by ancient custom or law of the rate at which baker and brewer should be remunerated for the service which their labour did to society. The uniformity of this practice was the justification for

other and subsequent statutes regulating the price of labour, statutes which were enacted and re-enacted from 1349 till 1824, at which latter date the labour statutes were repealed *en masse*. After the discipline of the manor court had become obsolete, the assize of bread and beer was enforced in quarter sessions uncertainly, but by the corporations of towns regularly into the last quarter of the 18th century, the archives of these corporations constantly supplying evidence of wheat and malt prices. The assize of bread and beer proves indirectly that the traditional food of the English was wheaten bread, and their drink barley beer, for the assize was a law which was operative all over England from the Scottish border to the Channel. It is to be observed that, except on very rare occasions, the legislature or the government did not affect to fix the price of the materials, wheat and malt, as foreign governments, especially that of France, habitually did. The regulation, too, was avowedly in the interest of consumers, for the rolls of parliament and the statute-book supply abundant evidence of the anxiety with which the government foresaw and provided against artificial dearness. Later experience has inferred that their remedies were nugatory, or even mischievous, but there can be no doubt as to their motives. In brief, the assize of bread and beer had the same object with the laws directed against BADGERS ; FORESTALLERS, AND REGRATORS, viz. the protection of the consumer.

J. E. T. R.

ASSIZE OF WEIGHTS AND MEASURES.

Besides the assize of bread and beer, weights and measures, and the articles themselves which were thus computed, were subject to similar legislation. Thus innkeepers, licensed victuallers, vintners, butchers, and others were subject to regulations of the same class. The "inholders" were to use measures "a small quantity bigger than the standard" to allow for the "working and ascending of the Yest and Froth," and, with the "Cooks and Victuallers," were "forbidden to bake, seeth, or roast, any Fish or Flesh twice, or sell and utter unto the subjects any manner of corruptible Victuals, which may be to the hurt and the infection of Man's body"—their "excessive price" was guarded against, and a scale appointed at which horses were to be received "to Livery at Hay and Litter by Day and Night." If the price of hay was 3ls. 6d. a load, the calculation was as follows:—

"Then if the Botel of Hay shall weigh three Pounds for a halfpenny, which is six Pound for one penny, and so 18 Pounds of Hay for three pence, the which 18 Pounds of Hay, with reasonable Provender at every watering, will suffice one Horse Day and Nigut." The rate for litter being fixed in proportion, it was considered that the "Inholder" would have "sufficient gain." The rates were to vary according as the

price of the "Load of Hay shall yearly increase and diminish." The rules for the butchers were more particular. These were "most carefully looked into and provided for by good and ancient Orders and Laws of this Realm, and also by Advice of the learned and skilful Physicians of the same;"—the Butchers were to take the utmost care that the meat was to be wholesome, they were not to "kill and sell any Bull or Bulls unbaiten." The weight also was to be exact and true. They were not to "sell their Flesh, with any Beam or Balance inclining more unto one end than to the other"; "Musty and Corrupted Meat" was also strictly guarded against. Similar regulations were also extended to other articles. "The Assize of Fuel, to be observed in the City of London, Westminster, and the suburbs of the same," fixed the size and weight of the sack of charcoal, the billet, and the faggot, requiring each "Faggot-band to contain in length three foot, and the Band of every such Faggot to be 14 inches about, besides the knot." Among the punishments for these offences was the pillory, the fraudulent butcher to be exposed there, and "his corrupt flesh to be burnt openly before his place in the Market-place," the fraudulent seller of fuel with a "Billet, Faggot, or Sack of Coals bound to some part of his body." Besides articles of this class, building materials were subject to similar regulations; the dimensions of lath, timber, and tiles were strictly laid down, and directions even given as to the manner in which the earth of which the tiles were made was to be worked. These regulations, together with those which regulated the assize of bread and beer, may be found described in *The Assize of Bread and other Assizes of Weights and Measures*, to which the name of John Powel, clerk of the market, originally of the king's (James I.) household, is attached. Reference is made in this to the order in council 31st January 1604, in which the whole question was reconsidered. The edition from which the quotations made above are made contains references to the early acts of parliament, etc., and is dated 1714. It is interesting as giving incidentally a vivid picture of "state regulation" in early ages.

[An account of the assize of bread, meat, and other necessities in Germany is given by Rohrscheide in *Jahrbücher für Nationalökonomik*, October 1888.]

ASSUMPTION, DEED OF (Scots law term). Deed of appointment of new trustees.

ASSURANCE. See INSURANCE.

ASSYTHMENT (Scots law). Damages suable at common law by wife, family, or relatives of person killed, from person culpable, though not convicted and punished, the assythment being both a consolation and an indemnification for pecuniary damage. A. D.

ATELIERS NATIONAUX, government workshops, tried in France 1848, with the object of affording relief, in the form of wages, to the

unemployed. The name is inexactly given to (1) the old *ateliers de charité*, which gave employment and a small wage, often in kind, to destitute workmen; (2) Louis Blanc's proposed *ateliers sociaux* or state-supported co-operative productive societies.

On the 25th February 1848, the day after the abdication of Louis Philippe, the provisional government, under urgent popular pressure, published a decree undertaking to guarantee a livelihood to every one who would work, and therefore to find labour for any citizen. Three days later public works were proclaimed to begin from 1st March; every one in want of employment was invited to apply to his mayor, who would immediately direct him to the national workshops. So precipitate was this step that no workshops could be found, nor any works except some trifling road repairs and navvies' jobs. To gain admittance to the "workshops" a man procured from his landlord a certificate of six months' residence in Paris, had this visaed by the local police, and exchanged it at the *mairie* for an admission ticket. The pay was two francs a day. When the number employed reached 6000 no work could be found for more. After vainly applying at each district, and having their admission tickets endorsed accordingly, men were paid 1½ frs. daily. Two central bureaux were opened to avoid the inconvenience of visiting each district. When the lack of work became notorious, men in regular work attended these bureaux, and drew 1½ frs. without quitting their own employment. Unscrupulous men obtained certificates from two landlords, and drew double pay. Moreover the "inactive" men formed angry crowds around the bureaux, endangering public order and alarming the government.

At this stage (3d March), a young chemist, M. Émile THOMAS, suggested that the men should be brigaded so as to assure regularity, centralise relief, and prevent double inscriptions, while a free registry should facilitate their employment by private persons. His plan was approved, and he was appointed director (6th March). He embodied ten men in a squad, five squads in a brigade, four brigades in a lieutenancy, and four lieutenancies in a company. Each division was under an officer eventually elected by his subordinates. A company, therefore, numbered 900 men. A *chef de service* commanded three companies, a *chef d'arrondissement* a district. The daily pay was: cadets, *élèves* is the original word, 5 frs.; these were students chosen by Émile Thomas from his old school the *École Centrale des Arts et Métiers*, where they were training for civil engineers, etc.; lieutenants, 4 frs.; brigadiers, 3 frs.; heads of squads, 2½ frs. (active), 1½ frs. (inactive); men, 2 frs. (active), 1 fr. (inactive).

By dint of tact and energy, M. Thomas maintained order. This was all he had under-

taken to do. He could not procure work. The government, glad to be momentarily rid of peril, turned a deaf ear to his appeals. He set some of the men to make shoes and clothes for others, but such small expedients availed little. His numbers steadily swelled, being: 21st March, 30,000; 16th April, 66,000; 15th May, 100,000; 25th May, over 115,000. The needy and criminal classes flowed in from all parts of France, and even from Belgium, and easily obtained false certificates of domicile. Ministers and influential men constantly pushed their friends and supporters into appointments as officers. 600 actors, artists, and clerks claimed in one day the right to employment. The expenses grew rapidly, but the government had political aims in view. At one time it counted on the *ateliers* for support at the polls; at another a minister spoke of using the men in the streets in case of a rising; yet again it was hinted that collapse would be useful in damaging the party of Louis Blanc, whose principles of *l'organisation du travail* and *le droit au travail*, were supposed to be bound up with the experiment (see BLANC, LOUIS). The jealousy of the official engineers still starved the *ateliers* of work. So futile were the tasks set the men that one of them sarcastically predicted they would be set to bottle off the Seine! After the elections, the government became alive to the expense and political danger of the growing agglomeration. The director was ordered (23d May) to dismiss immediately all bachelors under twenty-five who would not enlist in the army, all men who could not prove six months' residence in Paris, and all who refused offers of private employment in their own trade. Day work was to give way to task work; and men were to be liable to be drafted into the provinces. M. Thomas protested that this ordinance was harsh, dangerous, and contrary to the previous decree of the whole government (25th February, *supra*). It was withdrawn for a time. But on the 20th June (M. Thomas having, meanwhile, been superseded) it was approved by the national assembly, and published. The workmen revolted at once throughout Paris. The *ateliers* were dissolved, and the rising was suppressed by troops after three days' fighting (23d to 25th June), during which 10,000 men were killed and 12,000 captured.

The *ateliers* were evidently not fairly tried. But they are open to fatal political and economic objection. A heterogeneous crowd of social failures employed in indefinite numbers by a party majority must seriously endanger political morality. Louis Blanc would have each man engaged at his own trade. Obviously, however, this replaces private enterprise by pure socialism. MILL (*Dissertations*, ii. 384) contends that the right to labour depends upon the same principle as the poor law of Elizabeth. But is the state fitted to discharge the correlative duty of em-

ployment? Taxing and trading are widely different functions. Fawcett (*Manual*, p. 586) considers that government might possibly, though rarely, be justified in giving employment during occasional depression.

[Consult *Histoire des Ateliers Nationaux*, par Émile Thomas, Paris, 1848; well condensed in the *Quarterly Review* for June 1850 (vol. lxxvii. No. 173).—*Rapport de la Commission d'Enquête sur l'Insurrection du 23 juin, et sur les événements du 15 mai 1848*, Paris, 1848.—*Histoire de la Révolution de 1848*, par L. A. Garnier-Pagès, Paris, 1861-72.—*1848 Historical Revelations*, Louis Blanc, London, 1858.] H. H.

ATKINSON, WILLIAM, born towards commencement of 19th century, was a Fellow of the Statistical Society, from which he retired in 1844. One of the early assailants of the classical school, he lays great stress on its inability to agree upon questions of population, of the preference of home over foreign trade, and its want of moral and religious principle. Though his own arguments in favour of protection are founded upon a rather abstruse "law of proportions," they have been welcomed by American economists. His last work gives curious details upon the influence of the orthodox school on commercial politics in England.

The Principle of Protecting Home Trade or the Principle of Free Trade Refuted, 1833.—*The State of the Science of Political Economy investigated*, 1838.—*Principles of Political Economy*, 1840 (reprinted 1843, New York, with an introduction by Horace Greeley).—*Principles of Social and Political Economy*, vol. i. (and last) 1858 (see CLASSICAL ECONOMISTS). S. B.

ATTACHMENT. 1. The legal seizure of a debtor's property. In the Rules of the Supreme Court the term is used for the process by which a judgment creditor tries to secure for himself the judgment debtor's money claim against a third party (called the GARNISHEE). The court may, on satisfactory proof that the judgment remains unsatisfied, and that the garnishee (who must be within the jurisdiction) is indebted to the judgment debtor, order the garnishee to pay the applicant to the extent of his claim. A peculiar process (called *foreign attachment*), by which any part of a debtor's property may be seized *before* judgment, is available for creditors whose claims have arisen within the city of London, through the instrumentality of the Lord Mayor's Court.

2. A writ of attachment against a disobedient party is used in the supreme court for the enforcement of—(1) judgments for the recovery of any property other than land or money; (2) judgments for payment of money into court if the liability is within the exceptions of the Debtor's Act; (3) judgments or orders against corporations wilfully disobeyed by the directors or officers; (4) orders to answer interrogatories, or for discovery or inspection of documents, and in several other cases. The disobedient party

is imprisoned until his discharge is ordered by the court. E. S.

ATTESTATION. The verification of a document by the signature of a witness or witnesses who were present at the time of its execution.

ATTORNEY, POWER OF. A document generally authorising an agent to act for his principal.

ATTORNMENT. An acknowledgment of tenancy by the tenant to a landlord. The purchase of land subject to leases was formerly incomplete till the lessees had attorned to the purchaser; but this was rendered unnecessary by the statute 4 & 5 Anne, c. 3. It was formerly usual to insert attornment clauses into mortgage deeds, so as to create a tenancy between the mortgagor and the mortgagee, and to give the latter a landlord's preferential rights. A clause of this nature would now mostly be futile unless the forms required by the Bills of Sale Acts of 1878 and 1882 are complied with; and as it exposes the mortgagee to certain special liabilities, it is considered more prudent for mortgagees to omit it. E. S.

ATTWOOD, THOMAS (born 1783, died 1856), belonged to a Birmingham firm of bankers during the first half of this century. The Birmingham Currency School, to which he belonged, were, as mentioned by J. S. MILL (*Principles of Political Economy*, bk. iii. ch. xiii. § 5), strong supporters of inconvertible currency. Thomas Attwood wrote the following pamphlets:

Letter to N. Vansittart on the Creation of Money and on its Action upon National Prosperity, Birmingham, 1817, 8vo.—*Observations on Currency, Population, and Pauperism*, Birmingham, 1818, 8vo.—*Exposition of the Cause and Remedy of the Agricultural Distress*, Hertford, 1828, 8vo. Evidence of Thomas Attwood before the Select Committee on the Depressed State of Agriculture, 1821, Parliamentary Papers, viii. pt. ii.—*Scotch Banker*, 1828, embodying six articles on banking and currency contributed by Thomas Attwood to *The Globe* (reviewed by Cobbett in his *Political Register*, for 24th May 1828, and noticed by the *Quarterly Review*, No. 78).—Letters of Thomas Attwood to the *Times* [and comments of the *Times* thereon, Oct.-Dec. 1843.] H. R. T.

ATTWOOD, THOMAS, AND THE BIRMINGHAM SCHOOL. Thomas Attwood is a signal example of good sense and general intelligence overborne by a futile monetary theory. He was the leader of the "Birmingham School," who advocated high prices maintained by inflation of the currency. Attwood and his followers taught a lesson needed by some of their contemporaries when they insisted on the hardship inflicted on debtors by a fall in general prices, or rise in the value of the monetary standard. But the extent of the evil was greatly exaggerated when the RESUMPTION OF SPECIE PAYMENTS in 1819 was made responsible for almost every trouble which subsequently befell the kingdom—the agricultural distress in England, the turbulence

of O'Connell in Ireland, or the "Rebecca" riots in Wales. The argument directed against the resumption deserves particular attention. It was held that the depreciation of paper with respect to gold just before the resumption was much less than the appreciation of gold with respect to things in general which followed the resumption. "That measure (which it was said would only effect a charge to the extent of 3 per cent) had imposed an additional burthen of 25, 30, or 40 per cent on every man in the community in all cases of deed, mortgage, settlement, or contract." Prof. WALKER appears inclined to ascribe some weight to this argument (*Money*, p. 388; *Money, Trade, and Industry*, p. 282).

Thomas Attwood's advocacy of monetary reform derived strength from his political influence. He was the founder of the "Political Union" at Birmingham, and took an active part in the agitation for parliamentary reform. It was believed that Attwood desired political reform principally as a means whereby to obtain a rectification of the currency. To that end he moved in the reformed parliament for a select committee to inquire into the causes of the general distress. This motion, like others which emanated from the Birmingham School, was lost.

Thomas Attwood was greatly assisted in this monetary crusade by his brother Mathias (born 1779, died 1851). Mathias's speech on the currency, 11th June 1822, is placed by Alison with HUSKISSON's speech on the other side, as "containing all that ever has, or ever can be, said on the subject." In 1830 Mathias proposed a double standard of silver and gold; at the rate of 15 $\frac{2}{3}$ lbs. of silver to 1 lb. of gold (Hansard, 1830, vol. xxv. pp. 102-145; Alison, *History of Europe*, 1815-52, vol. iv. ch. xxii. § 32). Mathias, unlike his brother, was a Tory. He was a successful banker, co-founder of the National Provincial Bank of Ireland, the Imperial Continental Gas, and other companies. So little is business power alone a guarantee of sound economical theory.

There is an appreciative account of Thomas Attwood and the Birmingham School in a series of letters which were addressed to the *Midland Counties Herald* in 1843 by two Birmingham men (T. B. Wright and J. Harlow) signing themselves *Gemini*, and were republished in 1844 in the form of a book under that title. The title *Gemini* was appropriate according to Sir Robert PEEL, for "the efforts of no single writer are equal to the production of so much nonsense" (Speech on the Bank Charter, 1844). According to this *par nobilis* "the political economy of Mr. Attwood has this one great distinguishing feature, that it releases the nation from the thralldom of the heart-chilling doctrine of MALTHUS. The world is capable of multiplying its production to an

almost unlimited extent; the governments of the world would have only to provide for the proper distribution of the productions, and the wants of all people will be supplied." Such are the beneficent results of "accommodating our coinage to man, and not man to our coinage" (*Gemini*, Letter 24). The cardinal tenets of the "Birmingham economists" are compendiously stated at page 104, and again at page 285 of *Gemini*.

There is in the library of the British Museum a life of Thomas Attwood by his grandson, C. M. Wakefield, "printed for private circulation;" which throws much light on the history of the Birmingham School. Mr. Wakefield does not profess to interpret his grandfather's views on currency.

J. S. Mill devotes a paragraph to the refutation of Attwood's theory of currency (*Pol. Econ.*, bk. iii. ch. xiii. § 4).

F. Y. E.

AUBAINE, DROIT D'. Under the French rule of law, known as the *droit d'aubaine* or right of alienage, the whole property of an alien dying in France without leaving children born in that country escheated to the crown. The royal right was not universally exacted, and at a very early period special exceptions were introduced in favour of certain classes. Thus Louis XI. exempted merchants of Brabant, Flanders, Holland, and Zealand from the operation of the law, and a similar privilege was extended by Henri II. to merchants of the Hanse towns, and from Scotland. Henri IV. and Louis XIV., in their desire to promote the settlement of skilled artisans in France, exempted at a later date various classes of workmen, and the latter king extended the exception to include aliens serving five years in the navy and then settling in France. The towns of Lyons, Toulouse, Bourdeaux, and some other ports in Provence and Guienne were also free from the operation of the rule.

Originally one of the rights possessed by the feudal lord, the *droit d'aubaine* or similar institutions, existed in most countries where the form of society was feudal; and the alien's power of bequest was restrained in the same manner in Tuscany, the two Sicilies, Spain, Germany, Prussia, Holland, Denmark, and other countries. Even in England the power of the crown over the goods of aliens was formerly considerable, though no strictly similar rule of law seems to have existed in this country. Treaties for the mutual abrogation of the right did something to modify the application of the law. But its complete abrogation is due primarily to the policy of NECKER, who was controller-general of finance at the time when the decree of the 6th August 1790 abolished the *droit d'aubaine* and the *droit de détraction* in France. In his work *De l'administration des Finances* he had already pointed out that owing to the expenses of collection the

annual net produce of the right did not amount to more than 40,000 écus. The *droit d'aubaine* in its original form was never re-established in France. But with the *droit de détraction*, which enabled the state to confiscate part of the property bequeathed by aliens, it reappeared in the *Code Civil* in a modified form. Under the provisions of sections 726 and 912 no alien could possess in France a larger power of succession or bequest than a Frenchman would possess in the alien's country. But even this relic of the old feudal right was abolished by the law of the 14th July 1819.

C. G. C.

AUCKLAND, WILLIAM EDEN, first lord, the third son of Sir Robert Eden, born 3d April 1744, M.P. for Woodstock 1774, was one of the five commissioners sent to America in 1778. As chief secretary, 1780-82, he established the National Bank of Ireland, and was sent by PITT to Versailles, 1785, to negotiate the commercial treaty with France, signed 1786. He was raised to the English peerage 1793, and died 28th May 1814. Among his writings are—

Four Letters to the Earl of Carlisle, London, 1779, 8vo (on public debts, credit, revenue laws, etc.; 3d ed., 1780, with a fifth letter on population).—*Short Vindication of the French Treaty*, London, 1787, 8vo.—*Substance of a Speech in the House of Peers on the Third Reading of the Bill for granting certain Duties upon Income*, London, 1799, 8vo (three editions).

H. R. T.

AUCTION, ORDINARY (Lat. *auctio*, an increase—because each bid is an increase on the preceding one). A public sale in which successive bidders increase the price until one offers a price which no others are prepared to exceed. The auctioneer is recognised by law as the agent both of the vendor and purchaser; he is bound to take out a licence to the amount of £10 annually; he is bound to give due public notice of the sale; to provide a properly attested catalogue; and, as a rule, the conditions of sale are printed on the catalogue. The auctioneer is forbidden to buy on his own account; and his sign of office is a hammer, the fall of which represents that the sale has been effected. It is a common practice for the actual vendor of the property put up to auction to bid until what he regards as a sufficient price for his goods has been attained, or he may place a "reserve price" upon them. Until the hammer falls the bidder may retract his bid, but when the hammer falls the contract is notified and there is no appeal upon either side. The auctioneer makes a charge for his services, which is paid by the vendor. At one time a duty was payable to the government upon the value of all auction sales, and in 1830 a revenue of £234,854 was derived from

£6,326,481 worth goods sold. But this duty has now been relinquished by the state. The conditions of sale usually contain a statement in effect that "any error or misstatement shall not vitiate the sale, but that an allowance shall be made for it in the purchase money," but this is only held to guard against unintentional errors, not designedly misleading statements. Many descriptions of merchandise, such as wool, tallow, hides and leather, timber, hemp, wine, etc., are sold by periodical auctions, at which buyers from all parts can conveniently attend and have a good selection to purchase from. At the five series of colonial wool sales in London, wool is annually disposed of to the value of £20,000,000 and more, and many others of these auction sales are most valuable in their results and in the worth of the goods disposed of. In 1830 the auctioneers' licences issued in the United Kingdom numbered 3043; in 1889 the number of licences issued in England and Wales was 5763, and in Scotland and Ireland 1278. The business of *auctioneer* is often combined with that of *appraiser* and *house-agent*, and in 1889 these combined businesses between them contributed £79,012 to the inland revenue. The sales of real property at the London Auction Mart are large, having amounted in 1889 to £4,304,954, in 1888 £4,447,840, in 1887 £3,989,099, in 1886 £4,120,044.

A **DUTCH AUCTION** is a public sale in which the vendor continues to lower his prices until a bidder is found, or until in his own interest he can lower them no more. Dutch auction sometimes enables a better price for the goods sold to be obtained than ordinary auction.

[As to effect on price by employing English or Dutch mode of sale by auction, see W. T. THORNTON on *Labour*, p. 47, *et seq.*, ed. 1869.]

AUDIFFRET, CH. L. G., Marquis d', born at Paris 1787, died April 1878. He entered, when still quite young, the financial department of the government, through all the grades of which he was destined to pass with great rapidity. Originally placed, 1805, as a book-keeper in the "Caisse des dépôts et consignations," he became, 1808, a clerk in the public treasury, and was appointed, 1815, director of the office of the "comptabilité générale des finances." Then, in 1829, he passed, from being director of the finances to the presidency of the "cour des comptes." He prepared in 1830 the *Rapport au roi*, which appeared in March under the signature of the Comte de Chabrol; was appointed a "Pair de France" in 1837, and in 1838 drew up the famous *Règlement de la comptabilité publique*, a subject of which he was acknowledged a passed master. In 1839 Audiffret published the *Examen des revenus publics*, (1 vol. in 8vo); in 1840 the first edition of the *Système financier de la France* (2 vols. in 8vo), in 1841, *Le Budget* (1 vol. in 8vo); in 1843 the

Libération de la propriété ou réforme de l'administration des impôts directs et des hypothèques (8vo, pamphlet), and in 1848 *La crise financière de 1848* (8vo, pamphlet). He entered the senate in 1852, having published, 1851, an 8vo pamphlet entitled *Réforme de l'administration financière des hypothèques*. An imperial decree, 24th April 1853, appointed him to the *Académie des sciences morales et politiques*. In 1854 he published a second edition of his principal work: *Le Système financier de la France* (5 vols. in 8vo); of this a 3rd ed., also in 5 vols., appeared in 1863-64. In these were embodied all his writings on administrative questions or others. To these five volumes were added a sixth in 1870, containing parliamentary reports, éloges, etc., and in 1876 a final one, under the title of *Souvenirs de ma carrière*, an autobiography in which he shows himself to be a persistent partisan of the monarchy, without regard to the occupant of the throne. A. C. f.

AUDIGANNE, AMAND, born at Antwerp 1814, died at Paris 1875. He was for many years employed at the *Ministère de l'agriculture et du commerce*; and wrote, commencing 1846, many articles in the *Revue des deux mondes*, on agriculture, trade, banking, railways, and particularly on the condition of the working classes, which had been the object of many conscientious inquiries on his part. Originally a declared Protectionist he became Liberal as time went on. In 1850 he published the *Ouvriers en famille* in the form of conversations (Paris, in 32mo, frequently reprinted), then, *Les populations ouvrières et les industries de la France* (2 vols. 1854, in 18mo, which has gone to a second edition), *L'industrie contemporaine* (1 vol. in 8vo, 1856), *Les ouvriers d'à présent et la nouvelle économie du travail* (1 vol. in 8vo, 1865), *L'économie de la paix et la richesse des peuples* (1 vol. in 8vo, 1866), *La lutte industrielle des peuples* (1 vol. in 8vo, 1867); then *Les chemins de fer aujourd'hui et dans cent ans chez tous les peuples* (2 vols. in 8vo, 1858-1862). This last is an economic and financial history of railways, principally in France, containing judicious remarks on the future of this great industry, some of which have been realised. A. C. f.

AUDIT. An audit is the examination of an account, or books of account, for the purpose of ascertaining their correctness. The word shows that such an examination originally consisted of the hearing of explanations from the person rendering the account, such as would be fitting from an agent when submitting his account to his principal. The term is now generally used in connection with the examination of accounts of public bodies or companies by persons appointed for the purpose, and accounts or books are considered as audited or proved if supported by such written evidence with regard to the transactions recorded as may, in the opinion of

the auditor, be considered sufficient to establish the correctness of the individual entries and the truth of the accounts. It has long been the habit of those responsible for the accounts of charitable institutions or publicly subscribed funds, to obtain and publish a certificate of one or more independent persons, to the effect that the accounts have been examined and found correct. Joint-stock companies also from an early period have employed the services of auditors, and the law which has grown up with regard to the management of these companies contains various regulations with reference to the audit of their accounts. The Companies Clauses Consolidation Act 1845 (8 Vict. c. 16) provides that, except where by special act auditors shall be directed to be appointed otherwise than by the company, two auditors, each holding at least one share in the undertaking, shall be elected by the company in general meeting, and that it shall be their duty to receive from the directors the periodical accounts and balance sheet, to examine the same, and confirm or report upon the accounts to be read at the ordinary meeting. The Companies Act 1862 (25 & 26 Vict. c. 89) and the great extension of joint-stock enterprise under limited liability which followed, led to greater attention being paid to the subject of audit. In the first schedule appended to that act, Table A, regulations for management are prescribed for such companies as may not have articles of association of their own framed to suit their individual requirements, and these include provisions with regard to the appointment and duties of auditors. The audit of the accounts of railway companies was the subject of special legislation in 1867, the attention of parliament having been drawn to the imperfect and erroneous accounts issued by some companies. The Railway Companies Act of that year (30 & 31 Vict. c. 127, § 30) prescribes:—

“No dividend shall be declared by a company until the auditors have certified that the half-yearly accounts proposed to be issued contain a full and true statement of the financial condition of the company, and that the dividend proposed to be declared on any shares is *bona fide* due thereon after charging the revenue of the half year with all expenses which ought to be paid thereout in the judgment of the auditors.”

The Regulation of Railways Act 1868 (31 & 32 Vict. c. 119, § 12) repeals the regulation of the Companies Clauses Consolidation Act 1845 as to auditors being necessarily interested as shareholders.

The parliamentary accounts of the public expenditure of the United Kingdom—that is, of all moneys expended for the public service by the various departments of the State out of imperial public moneys—are rendered to and audited by the comptroller and auditor-general, under the Exchequer and Audit Departments Act

1866 (29 & 30 Vict. c. 39). This act, which abolished the former offices of comptroller-general of the exchequer and of commissioners of audit, defines the functions of the comptroller and auditor-general generally in regard to the examination of the public accounts; and in particular requires him, on behalf of the House of Commons, to examine and report on the “appropriation accounts” of money granted by parliament upon the annual estimates for the naval, military, and various civil services. These last-named annual accounts, and the reports of the controller and auditor-general thereon, are presented to the House of Commons at the commencement of the session immediately following their preparation, and are reviewed by a committee of the House, called the “Public Accounts Committee,” who take evidence from the departments concerned, and from the TREASURY, on any points to which attention is drawn by the comptroller and auditor-general, and report their conclusions and recommendations to the House.

The procedure to be observed in an audit, and the extent to which an audit can be carried, depend largely on the character of the transactions of which the accounts which are the subject of the audit are the record. The audit of the cash account of a charity would naturally include the vouching of the payments by the written acknowledgments of the persons to whom the cash is paid, and of the receipts by the counterfoils of the printed forms filled up at the time of acknowledgment, or, if there be such, by the published list of subscriptions and donations. The auditor might obtain evidence to satisfy him that all the moneys that should have been received had been brought into the account, that the payments were correctly made and proper in their character, and that the balance of funds in hand at the date of closing the account duly existed. This should be proved by the bank pass-book supported by a certificate from the bankers. The audit in such a case might be thorough and complete.

The audit of a bank, on the other hand, cannot be carried much further than the examination of the accuracy of the balance-sheet as representing the financial position of the company at the date of the account. It would be impossible for the auditor, even if evidence were procurable, to prove the innumerable entries recording the transactions of the bank and resulting in the profit taken credit for, and his work necessarily consists mainly of an examination to ascertain that the assets and liabilities of the bank are correctly described in the balance-sheet, that the assets are taken at no more than their actual value, due reserves being made for any depreciation in the value of securities or for probable loss or bad debts, and that all the liabilities are brought into the account. The securities representing investments should be

examined at the date to which the accounts are made up; the stocks which are registered without the issue of a certificate, such as consols, bank stock, and most colonial stocks, being proved by a special letter from the Bank of England or other registering office, certifying the holding.

With railways, the abstracts of traffic from which the revenue is derived, are in all large companies submitted to the examination of a distinct department of the railway called the "audit department" which is wholly independent of the issue of tickets or the receipt of cash, and the shareholders' auditor can but accept the totals arrived at by that department as the gross earnings of the company. It is his duty to see that these are duly entered and accounted for, to examine into the correctness of the records of the company's expenditure, and more especially to satisfy himself that the allocation of this expenditure as between capital and revenue is a fair one.

It is not considered the duty of an auditor to express any opinion as to the policy of a board of directors, or to object to any outlay which the board, under parliamentary authority, or under the general powers entrusted to directors, may think fit to incur; but should any expenditure take place of an unusual character, or which, in the auditor's opinion, the directors are not authorised to make, or should the accounts be drawn up on what appears to him to be an erroneous basis, it is incumbent on him, if his views are not adopted by the board and the accounts amended accordingly, to see that the facts are laid before the shareholders.

The duties of auditing now form a very important portion of the business undertaken by chartered accountants. The variety and intricacy of present systems of account keeping make it difficult for persons, without special training and experience, to discover error and, it may be, fraud, on the part of those who draw them up, and it has become the practice of companies and other public bodies to appoint professional men for this purpose. As an instance of this tendency the statutes made for the universities of Oxford and Cambridge by the commissioners acting in pursuance of the Universities of Oxford and Cambridge Act 1877, provide for the audit of the accounts both of the universities and of all the colleges, either by professional accountants carrying on business in London or Westminster, or by persons conversant with accounts approved by the permanent secretary to Her Majesty's Treasury. It is also an increasing practice with private banks and commercial firms to have the accuracy of their books and annual balance-sheets tested by professional accountants. The rapidity of modern commercial transactions leads to the finance of business offices being entrusted more and more to salaried assistants, and, as a check on these, to the employment of independent

persons to supervise the work periodically. The methods adopted by the professional accountant and his trained clerks in the examination of books, constitute a more complete, systematic, and independent audit than can be easily undertaken by a partner in the business, however conversant he may be with the work. An audit of this kind secures, as far as possible, accurate bookkeeping, the detection of fraud, correct and intelligible balance-sheets, and the proper distribution of profits or losses, and acts in not a few cases as a deterrent from crime by practically destroying the probabilities that wrong-doing will escape detection. Such firms and companies also who seek to attract business by exhibiting the sound condition of their finances, and with that object publish their balance-sheets, find it necessary to have their accounts confirmed by independent professional men, on whom a very large share of responsibility properly rests for the accuracy of the figures which they certify.

[*Auditors, their Duties and Responsibilities*, F. W. Pixley, London, 5th ed. 1889.] E. W.

AUDIT (Scots law). Taxation.

AUDIT OFFICE. The department of the state, officially designated the EXCHEQUER and audit department, which is entrusted with the audit and control of the public accounts.

The necessity of making provision for an efficient audit of the receipt and expenditure of public moneys has long been recognised, the office of auditor of the exchequer, the most ancient of all offices of control, having been established as far back as the year 1314. Many of the great departments of the state were at the outset subject to separate and independent audit arrangements, but in the year 1785 a special office for auditing the public accounts was created, and the first step of importance taken towards the concentration of this function in the hands of a single authority. In 1867 this object may be said to have been definitely attained by the amalgamation of the offices of the comptroller-general of the exchequer and of the commissioners for auditing the public accounts, a single department being then established for the dual purpose of controlling the receipts into and issues from the exchequer, and of examining the accounts of receipt and expenditure.

The responsible heads of this department are the comptroller and auditor-general and the assistant comptroller and auditor, both of whom are appointed by the crown and hold their offices during good behaviour, being immovable except on an address from both houses of parliament.

The comptroller and auditor-general is required to examine, on behalf of the House of Commons, the accounts of all moneys voted in supply, or which are a charge on the consoli-

dated fund, and for this purpose full powers of access to public accounts are given him. He is required to report the result of his examination annually, and if the treasury fail to present his reports to the House of Commons, he must do so himself. In addition to this duty technically described as the "appropriation audit," the comptroller and auditor-general must, if the treasury so direct, examine and audit any other public accounts submitted to him for the purpose, but in respect to this portion of his functions, the comptroller and auditor-general must accept the decision of the treasury on any question which he may raise, his direct responsibility to the House of Commons being limited to the appropriation audit above referred to. In connection with the exchequer branch of his department, the comptroller and auditor-general is required from time to time, upon the requisitions of the treasury, to grant credits upon the exchequer for consolidated fund and supply services, if he is satisfied that they are not in excess of the sums granted by the various acts of parliament, and all warrants for the preparation and issue of exchequer bills and bonds and treasury bills are countersigned by him.

Recently, the opinion has been very generally expressed that the manufacturing, shipbuilding, and other like accounts of the army and navy should be subjected to a more rigorous independent scrutiny than has hitherto been the case. Effect has been given to this opinion in the Army and Navy Audit Act, 1889 (52 and 53 Vict. c. 31), which imposes upon the comptroller and auditor-general the duty of examining accounts showing the distribution and cost of labour employed and the value of stores expended in the several government dockyards, ordnance factories, and other manufacturing establishments of the army and navy.

For the year 1887-88, 228 persons were employed in the service of the department, the cost, mainly for salaries, amounting to £52,216.

The duties of the audit office are set forth in detail in the act 29 and 30 Vict. c. 39, and the annual reports of the comptroller and auditor-general issued with the appropriation accounts for the army, navy, and civil services respectively may also be consulted. T. H. E.

AUDITOR OF THE COURT OF SESSION.
Taxing-master.

AUGMENTATIONS, COURT OF. This was created in 1536 to collect and administer the property of the dissolved monasteries. It consisted of a chancellor-treasurer, an attorney, ten auditors, and seventeen receivers. A vast amount of wealth passed through the hands of this body during the next few years. In 1545 the property of colleges, chantries, hospitals, and guilds was also confiscated to the king, and its administration entrusted to the court of augmentations. But this enormous property was soon dissipated by the extravagance of

Henry VIII. and of the council under Edward VI., and with its dispersal the functions of the court came to an end.

[Perry, *History of the English Church*, 1887, vol. ii.] R. L.

AUGUSTINIS, MATTEO DE (a Neapolitan, living in the first half of 19th century), the author of two elementary treatises of political economy; both are summaries of the leading doctrines of his time, mixed with criticisms from a moral and political point of view. He is of opinion that FREE TRADE ought somewhat to be restricted for moral and social considerations, and considers A. SMITH's doctrines as leading sometimes to anarchy of both personal interest and human passions; nevertheless he thinks that liberty ought to be the rule, and government interference the exception. De Augustinis represents a singular intermixture of doctrines taken from J. B. SAY, DUNOYER, SENIOR, and other liberal economists, and of doctrines taken from SISMONDI and ROMAGNOSI favourable to state interference. He is an eclectic writer, somewhat like FLOREZ-ESTRADA. In the theory of value he tries to reconcile the doctrines based on the cost of production with those based on the principle of utility; but he does this in an infantine manner. This author, like CAGNAZZI and many other second-rate economists, would have been totally forgotten by this time if the modern historical school and the SOCIALISTS OF THE CHAIR had not picked up and collected every trace of opposition which in course of time had manifested itself against the so-called English school, and if they had not given a renewed importance to the intermixture of moral, or political, or social questions, with economic topics. De Augustinis's *Istituzioni di Economia Sociale* appeared in 1837, Naples (tipografia Porcelli), and his *Elementi di Economia Sociale* in 1843. His best work is a critical essay on Pellegrino Rossi's lectures on political economy: *Studi critici sopra il corso di Economia pol. di P. Rossi*, Napoli, 1844. He examines in it one by one the thirty-six lectures of ROSSI, making not seldom acute remarks in favour or against doctrines of Rossi. This work was originally published in a series of articles in a weekly review called *Lucifero*, and now forms a volume of 176 pages of small print in 8vo.

As statistician he is known by a series of letters on the economical condition of Naples: *Della condizione economica del Regno di Napoli*, Lettere, Napoli, 1833, Manzi. M. P.

AULNAGER. Under Richard I. it was ordered that "woollen cloths, wherever they are made, shall be of the same width, to wit, of two ells within the lists, and of the same goodness in the middle and sides." This rule was again asserted in Magna Charta, art. 35, and under Edward I. an official, called *aulnager*, was appointed to enforce it. It was his duty

to affix a stamp to all cloth as evidence that it was of the necessary size and quality. When the arbitrary regulations of Richard I. were abandoned in the 14th century, the aulnager's stamp was still used to certify the difference between any piece of cloth and the old requirements. The office continued to exist until the reign of William III., but it had ceased to be of much importance in securing customers against fraud and imposition.

[Ashley, *Economic History*, i. p. 180.] R. L.

AUNCAL, or HANDSAL weight, a kind of balance used in weighing wool. Forbidden by 25 Ed. III.

[Smith's *Memoirs of Wool*, 1747, vol. i. p. 38.] J. B.

AUSTRIAN SCHOOL OF ECONOMISTS, THE. Among German-speaking nations the predominant school of economists has been, since the middle of the century, the historical, which seeks to reconstruct economics by the aid of history and sociology. Since 1871 its supremacy has been threatened in Austria (if not in Germany) by a group of writers who have returned to the deductive method. From their agreement in method and leading doctrines, as well as from their virtual collaboration with each other, these writers are justly regarded as a distinct school, which may (from the nationality of the chief members) be called the "Austrian" school of economists. Their method is, like Ricardo's, deductive; and, like RICARDO, they treat the doctrine of value as the cardinal point in economic theory. Their results, however, differ considerably from the Ricardian. Like JEVONS, they find the key to the problem of value in the notion of final utility. Unlike JEVONS, they regard economics as having nearer affinity with psychology than with mathematics, and they are sparing in the use of mathematical illustration. They have thus made the doctrine of FINAL UTILITY (*q.v.*) intelligible to a wider circle; and have influenced economists outside of their school (for example, M. Block in France, Professor Cossa in Italy, and Professors J. B. Clark, E. B. Andrews, and S. Patten in America). They have been opposed in Germany by L. Brentano, Schmoller, Neumann, and others. The chief authors and works are the following:

Carl Menger, *Grundsätze der Volkswirtschaftslehre*, Vienna, 1871; *Methode der Sozialwissenschaften*, Vienna, 1883; *Irrthümer des Historismus in der deutschen Nationalökonomie*, Vienna, 1884. —Friedr. v. Wieser, *Ursprung und Hauptgesetze des wirtschaftlichen Werthes*, Vienna, 1884; *Der Natürliche Werth*, Vienna, 1889. —Emil Sax, *Wesen und Aufgaben der Nationalökonomik*, Vienna, 1884; *Grundlegung der theoretischen Staatswirtschaft*, Vienna, 1887. —Eugen v. Böhm-Bawerk, *Rechte und Verhältnisse vom Standpunkte der volkswirtschaftl. Güterlehre*, Innsbruck, 1881; *Kapital und Kapital-zins*, vol. i., Innsbruck, 1884; vol. ii., Innsbruck, 1889. —Robert

Zuckerkindl, *Theorie des Preises*, Leipzig, 1889. —E. von Philippovich, *Aufgabe und Methode der politischen Oekonomie*, Freiburg, 1886. —Robert Meyer, *Principien der gerechten Besteuerung*, Vienna, 1884; *Das Wesen des Einkommens*, 1887. —Victor Mataja, *Der Unternehmergewinn*, Vienna, 1884; *Das Recht des Schadenersatzes*, Vienna, 1888. —Johann v. Komorzynski, *Werth in der isolirten Wirtschaft*, Vienna, 1889. —Dr. E. Seidler in *Jahrb. für Nat. Oek. und Statist.*, March 1890 applies the theory of value to doctrine of legal punishments; he gives a full bibliography. —Ugo Mazzola, *Finanza pubblica* (Rome, 1890). —C. A. There is a corresponding influx in the months of May and June of 2 to 3 millions.

The effect of this autumnal pressure was described, 1857, by the late Mr. William Langton to the Statistical Society of Manchester (*Transactions*, Session 1857-58), and the investi-

gation was carried on, with his accustomed ingenuity and research, by Prof. W. S. JEVONS, 1866 (*Statistical Society of London Journal*, vol. xxix.) The pressure appears to be enhanced somewhat by the requirements of the Bank Act of 1844, in consequence of the movements in the Scotch and Irish issues. On average, for the years 1846-1900, the rate of discount charged by the Bank of England was higher during the autumn months, and particularly in November, in connection with this movement. A somewhat similar influence is traceable in the returns of the banks of France and Germany.

AUXIRON, CLAUDE FRANÇOIS JOSEPH D' (b. 1728, d. 1778), an engineer and physiocratic economist; was author of the anonymously published—

Principes de tout Gouvernement, ou Examen des causes de la faiblesse ou de la splendeur de tout état considéré en lui-même et indépendamment des mœurs, 1766.

F. Y. E.

AVERAGE. In the most familiar application of the term the average of a given set of quantities denotes their sum divided by their number, their arithmetic mean. More generally an average may be defined as an intermediate value derived from a given set of quantities by a process such that, if all the quantities were equal, the derivative quantity would coincide with the given ones. For example, if a , b , c , etc., are given quantities in number n ,

then the expression $\sqrt[n]{\frac{a^2 + b^2 + c^2 + \text{etc.}}{n}}$ is an

average. Of the forms included under this definition the number is infinite. The following four appear to be most important: (1) the arithmetic mean above defined;—(2) the geometric mean, formed by multiplying n quantities together and extracting the n th root;—(3) the median, which is such that, if the given quantities be arranged in the order of their magnitude, there shall be as many of them above as below the median;—(4) the mean value distinguished by Fechner as “dichteste werth,” and by De Venn as the “maximum ordinate average,” which is such that in its neighbourhood the given quantities cluster most densely.—Varieties of these species arise when, instead of allowing to each of the given quantities an equal part in forming the average, we assign more importance to some of the data than to others.

In choosing among these different species and varieties, attention must be paid to two rather subtle distinctions. First, in taking an average we may have in view some special purpose as distinguished from the general objects of art and

science. Suppose, for instance, our object in finding the average variation of prices is to ascertain how much the monetary value of a specified set of articles, say the necessaries of a labouring man, has varied. This specific object is evidently correlated with a qualified or weighted arithmetic mean. But, if the average stature for each of several districts were required, in order to investigate whether there is any connection between height and food (or other attribute), there is no longer the same presumption in favour of the arithmetic mean. Possibly the third or fourth species of average might be better. Again, the average may or may not be designed to represent something outside and behind the given numbers. Thus in taking the average of several independent estimates of the number of coins in a country, our *quæsitum* is an objective thing, the real amount of coin. Less substantive, but still extraneous to the given statistics, is a species of *quæsitum* more common in social science, which may be described as that mean value towards which tends the average of the *complete series*, of which the given statistics are only samples. Thus, in taking the average of a given set of price-variations, we may aim at ascertaining, as far as possible, what would be the mean variation of prices, if we could complete the whole series of statistics out of which we have only selections.

The general result of these considerations is, on the one hand, in many cases to add some reasons in favour of the arithmetic mean besides the obvious grounds of familiarity and convenience, and, on the other hand, in certain cases to show that one of the other species of average is preferable (see ADJUSTMENT, AVERAGE; AVERAGE, MARITIME).

F. Y. E.

AVERAGE (MARITIME), is the custom that all parties concerned in the adventure of a vessel at sea are liable in equitable proportion to contribute their shares of losses (particularly those arising from “jettison” or the throwing overboard of cargo to lighten the vessel) and of expenses, when such losses and expenses are incurred for the common good by one or more of the adventurers. Although this custom is

not expressly set forth in the most ancient sea-laws, owing perhaps to the then infrequency of joint-stock adventures at sea, it came at length to be so fully and clearly adopted in the laws of Rhodes as to commend itself in its integrity to the founders of the Roman civil law, and afterwards, with occasional modifications of no very great importance, by all commercial countries, from the date of the Pandects down to the present time. The chapter of the digest *De Lege Rhodia de Jactu* (xiv. 2) gives full details. The following is the illustrative example it contains: "Wherefore, if two men should each of them own a hundred parts in the cargo, and Caius, the owner of the goods thrown overboard, shall own two hundred, Caius, on a loss of the cargo, should receive fifty from each of them: losing his other hundred by shipwreck, because he had just as large a share in the wares lost as they together had in the wares preserved. Hence, as the share of Caius, which represented two hundred, was in excess of the share of each of them which represented one hundred each, in the same proportion after the disaster, the share of Caius, representing one hundred, will be in excess of the share of each representing fifty, just as both before and after the disaster the share of Caius exceeded by a half the share of each of the others. On the other hand, if Caius should throw overboard wares to the value of fifty, but each of the other men shall have kept his own, estimated at one hundred each, Caius shall suffer a loss of ten, but these other two shall contribute double each, namely twenty; so that just as his fifty answered to the one hundred of each of his partners, in like manner his forty may answer to the eighty apiece that each of them retains."

It would certainly have conduced to clearness if this example had set out that the total

cargo was made up of 400 parts, and that the loss of Caius's goods, 200 parts, entailed an average contribution of one-half on each of the adventurers' shares. Similarly, in the second case, the total value of the cargo was 250, and the loss of Caius's goods, worth fifty, entailed an average contribution of one-fifth on each of their shares in the total value. F. H.

AWARD. The decision of the arbitrators or of the umpire to whom parties, wishing to avoid recurrence to a legal tribunal, have referred their dispute. A submission to arbitration may be made a rule of court on the application of either party, and if this has been done, the award may be enforced with the court's assistance; otherwise the only means of compelling the party, against whom the award has been given, to satisfy its directions, is to bring an action and to obtain judgment on the basis of the award (see **ARBITRATION**). E. S.

AZUNI, DOMENICO ALBERTO, born at Sassari (Sardinia) in 1760, died 1827 at Cagliari in Sardinia. A famous commercial lawyer and president of the Court of Appeal of Genoa, he became a member of the French *corps législatif*, and was appointed by Napoleon I. one of the members of the commission which drew up the *Code de Commerce*. He was the principal author of the *Livre deuxième du Commerce maritime*. Maritime commerce, is also the subject of his principal works which are written in French, or in French and Italian.

Sistema universale dei principii del diritto marittimo dell' Europa; the French edition has the title *Droit maritime de l'Europe*;—*Essai sur l'histoire géographique, politique et morale de la Sardaigne*;—*Sull' origine della bussola*; *Dizionario di giurisprudenza mercantile*;—*Mémoires pour servir à l'histoire des marins navigateurs de Marseille*. M. P.

BABBAGE, CHARLES, born near Teignmouth 1792, studied at Trinity College, Cambridge, graduating (without honours) 1814. In 1816 he was made fellow of the Royal Society. He was also an active member of the Astronomical Society. Feeling the defects of the Royal Society as then organised, he helped to found the British Association (1831), the statistical section of which (1833) was due to him, as well as the Statistical Society (1834). Between 1822 and 1843 his time and money were almost wholly devoted to the building of his two great calculating engines, one of which (partially complete) is preserved in the South Kensington Museum. In 1828 he was chosen Lucasian professor of mathematics at Cambridge. He wrote not only on mathematical subjects, but on geology, the diving bell, lighthouses, metal-planing, life insurance, infant mortality, taxation, and last (but to economists not least), on machinery and manufactures. His last

public efforts were to repress the barrel-organ, an unhappy application of mechanical invention to the fine arts. He gave the world a retrospect of his own career in *Passages from the Life of a Philosopher* (1864). He died in 1871.

Though Babbage himself has done comparatively little for economic theory, he has certainly aided it indirectly, by his full and faithful descriptions of some of the most characteristic phenomena of modern industry. If he is content to take most of his economical doctrines at second hand, he at least holds them intelligently, and states them with a vigour of his own, dwelling chiefly on the aspect which strikes him most. Political economy, he says, proceeds on the assumption of certain principles which are no more than general,—not compelling universal obedience like the principles of mathematical science, but no less than general, being much more frequently obeyed than violated. Such is, *e.g.*, the principle that

men are governed by their imagined interest, and that each individual is the best judge of this for himself. The proper method of economic (as of other) inquiries is "to divide the subject into as many different questions as it will admit of, and then to examine each separately, or in other words, to suppose that each single cause successively varies, whilst all the others remain constant." It is hopeless for those who cannot master the separate questions in their simplicity to make a successful investigation of their united action (*Exposition of 1851*, pp. 1-4). Babbage has a clear view of the distinction between economics and the exact sciences, and, though a mathematician and a contemporary of Cournot, Whewell, and Tozer, he makes no attempt to treat political economy by mathematical methods. He lays down with great clearness the distinction of fine arts from industrial arts, a technical distinction that involves an economical one. He makes it plain that economical inquiries must deal mainly with industrial arts. In the fine arts, "each example is an individual, the production of individual taste, and executed by individual hands," and therefore costly. In the industrial, "each example is but one of a multitude generated according to the same law, by tools or machines, and moved with unerring precision by the application of physical force," and therefore cheap (*Exposition of 1851*, pp. 48, 49). The social and economical effects of cheapness are brought out by Babbage with useful reiteration in support of free trade, and more especially in connection with the invention and application of tools and machinery. In fact, his chief direct contribution to theoretical economics has been his clear analysis of the Division of Labour (*g.v.*), and of the economical function of Machinery in the modern industrial system. In regard to division of labour, the merits of his discussion of the subject are generally admitted. He pointed out that the advantages mentioned by Adam Smith in the *Wealth of Nations* (bk. i. ch. i.), would not explain the cheapness of manufactured articles, unless, to that author's list we add the following (*Economy of Machinery and Manufactures*, ch. xviii. p. 137). "That the master manufacturer, by dividing the work into different processes, each requiring different degrees of skill and force, can purchase exactly that precise quantity of both which is necessary for each process,—whereas, if the whole work were executed by one workman, that person must possess sufficient skill to perform the most difficult, and sufficient strength to execute the most laborious, of the operations into which the art is divided." In other words, advantage must be taken of the several individual capabilities of the workmen, intellectual and physical, and the work must be so organised that workmen be only called upon to do that which they can do best

of all. In the statement of this principle he has, as he allows, been anticipated by Gioja, the Italian economist (*Nuovo Prospetto delle Scienze Economiche*, vol. i. ch. iv., Milan, 1815); but he was led to it independently by his own observation of the actual working of English and foreign factories. Without this organisation of labour (he says), full advantage cannot be taken of tools and machines, however ingenious. The nature of machinery, as distinguished from mere tools, is thus described: "When each process has been reduced to the use of some simple tool, the union of all these tools, actuated by one moving power, constitutes a machine" (*Economy of Machinery and Manufactures*, p. 136; cp. Marx, *Kapital* I. xiii. 389 note). The examples show that Babbage conceived, as Marx has done after him, that so long as the moving power is simply the human muscles, we have to do, not with a machine, but only with a tool. It is on subjects like these, at once of technical and of economical importance, that Babbage is at his best. In his views on taxation and currency, he accepts substantially the ordinary doctrines of the dominant school of economists. His criticisms of the defects in the exhibition of 1851 remind us in many places of Cobden's views (*e.g.* in *England, Ireland, and America*) on the blessings of cheap goods and large advertising. But in his *Economy of Machinery and Manufactures* (1832), Babbage not only showed the range and accuracy of his own personal observation and inquiry, but displayed a better comprehension of the economical bearings of the factory system of production than any previous economical writer. The book is a storehouse of illustrations from actual business; the writer never draws on his imagination for an example when his memory and his note-book will serve him. On the other hand, his book is not like Beckmann's *History of Inventions*, a mere collection and narrative of facts, without an interpretation of them by economical principles, nor is it, like Ure's *Philosophy of Manufactures*, a mere eulogy of the factory system of his own day. Though he lays, perhaps, undue stress on the capitalist, and his gains by the economy of materials and labour, he sees the need of improved industrial arrangements for the workmen, co-operative stores, and industrial profit-sharing, and is in favour of the abolition of the truck system, and all unfair restrictions on workmen's liberty of combination (*Economy of Machinery and Manufactures*, ch. xxi. p. 177, ch. xxviii. p. 253). He is no blind worshipper of Mammon; and he sneers at the vulgar notion that no calling is respectable which does not produce wealth. It is in the public interest rather than their own that he wishes scientific men to have a larger material reward than niggardly governments were then granting (*Exposition of 1851*, p. 147, etc.)

He wrote with feeling on this last subject because he was himself above everything an inventor. This is not the place to discuss the merits of his calculating engines, or the justice of his complaints against the successive governments with which he contended in his twenty years' endeavour to build his engines (see Appendix to *Exposition of 1851*). But we may note that his design in the invention of them was simply to convert into physical mechanism what had already become a mechanical process psychologically (*Mach. and Manuf.*, ch. xix. p. 157), and this is one of the brightest aspects of the work of a modern inventor. In the abstract, Babbage was far from magnifying an inventor's office. "The man who aspires to fortune or fame by new discoveries must," he says (*Mach. and Manuf.*, ch. xxv. p. 212), "be content to examine with care the knowledge of his contemporaries, or to exhaust his efforts in inventing again what he will most probably find has been better executed before; the power of making new mechanical combinations is a possession common to a multitude of minds, and by no means requires talents of a high order." It results, he believes, from the principle of the division of labour, which should be applied not only to industrial, but to mental labour, and has a great career still before it in the latter field. Under happier auspices, Babbage would no doubt have led the way in person still further than he did, in the directions thus indicated.

Those of his works which are directly and indirectly of most economical importance are the following:—*On the Economy of Machinery and Manufactures*, 1832, third edition, 1833.—*Thoughts on the Principles of Taxation with reference to a Property Tax and its Exceptions* [exemptions from it], 1848; second edition, 1851; third edition, 1852. An Italian translation of the first edition, with notes, was published in 1851 at Turin.—*Observations on the Decline of Science in England*, 1830 [largely an attack on the Royal Society].—*A Comparative View of the different Institutions for the Assurance of Life*, 1826.—*Essay on the General Principles which regulate the Application of Machinery* (from *Encyclop. Metropolitana*, 1829).—"Letter to T. P. Courtenay on the Proportion of Births of the two sexes amongst Legitimate and Illegitimate Children" (Brewster's *Edinr. Journal of Science*, vol. ii. p. 85, 1829).—"On the Principles of Tools for Turning and Planing Metals" (In Holtzapffel's *Turning and Mechanical Manipulation*, vol. ii. 1846).—*The Exposition of 1851, or Views of the Industry, the Science, and the Government of England*, 1851.—*Statistics of the Clearing House*, reprinted from *Transactions of the Statistical Society*, 1856.—*Passages from the Life of a Philosopher*, 1864. J. B.

BABEUF, FRANÇOIS NOËL, called *Caius Gracchus*, born at Saint Quentin 1764, died at Vendôme, 24th February 1797. Left to his own resources at the age of sixteen, his youth was stormy, and his whole life wild and irregular. From the commencement of the Revolution he

wrote in the journal *Le correspondant Picard*, articles so violent in tone that he was brought to trial. His acquittal, 14th July 1790, did little to calm him. Appointed administrator of the Département of the Somme, he soon had to be dismissed from that office. This was the time at which he took the name of *Caius Gracchus*, posing as a *Tribun du peuple*. He gave the same name to a journal, which he had previously carried on under the sub-title of *Défenseur de la liberté de la presse*. All this took place shortly after the fall of Robespierre from power. This for a time had his approval; but he soon returned to his earlier views and appealed to those violent passions which, as a demagogue, he knew how to rouse. He gathered round him, under the name of the *Secte des Egaux*, all the old Montagnards who were dissatisfied with the régime of the Thermidorians. The object of this sect, which drew its inspiration from some of the sentimental ideas of J. J. ROUSSEAU, was to destroy inequality of condition, with the object of attaining the general good. Sylvain Maréchal, author of a *Dictionnaire des Athées*, BUONARROTI, who claimed to be descended from Michael Angelo, with Amand and Antoinette, who did not, it is true, remain associated long, and some others, formed the staff which recognised Babeuf as their chief. Working with feverish activity, they gathered round them a considerable number of adherents. The place where their club met was the Pantheon. At first orderly, their meetings became tumultuous and threatening and were prolonged far into the night. Attending armed, they prepared to resist by force the dissolution of the club which the authorities had determined on. General Bonaparte, acting with much tact, contrived to close the meetings of the club, but the members formed themselves forthwith into a secret society, and gradually, by winning over soldiers and police, became a formidable body, numbering nearly 17,000 able-bodied and armed men, without including the Faubourgs Saint-Antoine and Saint-Marceau, which were at their back. Addressing themselves to the masses, they published a manifesto written by Sylvain Maréchal in his most inflammatory style—"We desire," said they, "real equality or death. This is what we want. And we will have real equality, no matter what it costs. Woe to those who come between us and our wishes. Woe to him who resists a desire so resolutely insisted on. . . . If it is needful, let all civilisation perish, provided that we obtain real equality. . . . The common good, or the community of goods. No further private property in land; the land belongs to no private person. We claim, we require the enjoyment of the fruits of the land for all; the fruits belong to the whole world," etc.

Instructions in great detail as to the methods of raising insurrectionary movements were added.

"Those who hinder us shall be exterminated ; . . . shall all alike be put to death : Those who oppose us or gather forces against us ; strangers, of whatever nation they may be, who are found in the streets ; all the presidents, secretaries, and officers of the royalist (*sic*) conspiracy of Vendémiaire, who may also dare to show themselves." If the lives of men were to be treated thus, one may guess what fate was reserved for their property. But, after massacres and spoliations, what was to come of it all ? The public authorities were to organise employment ; there was to be only one source of employment, the state, with subdivisions devised to meet the wants, somewhat rudimentary, of the community. Every one was to have a right to lodging, clothes, washing, warming, and lighting, to food, *médiocre mais frugale*, to medical attendance. This is much what Louis BLANC, who appears to have sought his inspiration among the decrees of the *République des Égaux*, enunciated in more methodical and sober language. "Every one is to work as he is able, and to consume according to his wants."

The secret was well kept ; it was only a few hours before the moment fixed for the explosion of the conspiracy (May 1796) that a captain, named Grisel, revealed it to the directory. Decisive steps were taken at once ; a vigorous watch was kept, while the public authorities seized the leaders and their papers.

Babeuf and Darthé, condemned to death the 23d of February 1797, stabbed themselves before the tribunal. Life still lingering on, they were guillotined the next day. Buonarroti and Sylvain Maréchal, condemned to exile (*deportation*), died, the first in 1837, the second in 1803.

It may be added that Babeuf seems to have had rather a disordered brain than an absolutely criminal disposition. He died with courage, leaving his wife a written paper declaring his conviction that he had always been a "perfectly virtuous man."

See BLANC, J. J. L. ; BRISOT DE WARVILLE ; COMMUNISM ; PROUDHON. A. C. F.

BACK-BOND (Scots law term). A declaration by one apparently an absolute owner that he is only a trustee or mortgagee.

BACKWARDATION. When a seller of stock "for the account" (*v.* ACCOUNT) on the stock exchange finds that he has not previously obtained the stock which he sold, he asks the dealer to whom he sold to allow him to prolong his bargain until the next settlement. If the security in question be unusually scarce, the buyer finds himself in a position to charge the seller for the accommodation, and the rate or fine which he imposes upon the person unable to deliver his stock or shares, according to the contract, is called a Backwardation. This fine, being paid again and again from settlement to settlement, at varying and sometimes very high rates, is the main source of profit in a CORNER (*q. v.*)

in stocks and shares. The unlucky seller in blank, being unable either to deliver or borrow stock in satisfaction of the contract, is occasionally at the mercy of the buyer. The stocks of certain railways have, on some occasions, been made so scarce by such operations that speculative sellers have had to pay whatever "backwardation" the successful speculative buyers have been pleased to impose. A. E.

BACON, FRANCIS (VISCOUNT ST. ALBANS). Born 1560-61, died 1626. At the time when Bacon lived, economic questions had not taken any separate place among the studies to which a statesman gave special attention ; but Bacon's mind, ingenious, fertile in resource, keen in research as it was, did not neglect the examination of those questions of policy which require economic treatment. Mr. Spedding (Bacon's *Works*, ed. Spedding, vol. iii. p. 515) considers that Bacon was "little before his age in his views with regard to usury, trade, etc." (See Essay xxxiv., "Of Riches"). By the time, however, when the essay on "Plantations" was written, COLONIES, as Mr. Reynolds observes, had been successfully founded. Bacon's remark, "Let there be freedom from custom till the plantation be of strength, and not only freedom from custom, but freedom to carry their commodities where they may make their best of them, except there be some special cause of caution," and those on the treatment and government of colonies generally, show perhaps his best judgments on these matters. Most of Bacon's writings deal with other subjects, but the reference to colonial possessions in his speech when lord chancellor on the election of Serjeant Richardson as Speaker (1620), describing this country's portion "in the New World, by the plantation of Virginia and the Summer Islands. . . . Sometimes a grain of mustard seed proves a great tree, who can tell?" (Bacon's *Works*, ed. Spedding, vol. xiv. p. 175), may also be quoted in this connection. The essay "Of the true greatness of Kingdoms and Estates," and the history of Henry VII., though these deal principally with politics, show that Bacon had taken the study of these branches of economics also "among his portion."

The editions of Bacon's *Works* are many. That edited by Spedding, Ellis, etc. (14 vols., London, 1857-74), and those of the *Essays* (London, 1881) and the *Advancement of Learning* by W. Aldis Wright, and of the *Essays* by S. H. Reynolds (both these Clarendon Press), may be specially mentioned. Mr. Reynolds remarks, and truly, that in Bacon's "views about trade he takes the mercantile theory as his guide."

BADGER. This name was formerly used to signify a small trader buying corn or victuals (fish, butter, or cheese, specially mentioned) in one place in order to sell them in another. The Act 5 & 6 Edw. VI. c. 14, § 7 exempts these men from the penalties enacted against FORE-

STALLERS and REGRATORS (*q.v.*), but requires them to be licensed by three justices of the peace of the county where they dwell. A subsequent act, 5 Eliz. c. 12, declares that the result of this legislation was that many persons "seeking only to live easily and to leave their honest labour" have taken up this trade, and enacts that licensees are to be householders having dwelt in the county for three years, and that the justices may require a badger to enter into recognisances not to forestall or engross. The rules as to licensing are made more stringent, and penalties assigned for a breach of them. The word is now obsolete except in certain dialects. It was used to denote the foreman of a GANG of agricultural labourers (Kebbel's *Agricultural Labourer*, 1870, p. 3).

[Tomlins' *Law Dictionary*, 1835.—Dr. Murray's *New English Dictionary*, s.v. 1884.] C. G. C.

BAGEHOT, WALTER. Born at Langport, Somersetshire, 1826, died at Langport, 1877. Bagehot was son of the managing partner of Stuckey's Bank who sent him to be educated at University College, London. After taking successively his B.A. and M.A. degrees at London University, with the highest honours, in 1846 and 1848, he read law, and was called to the Bar; but, after a visit to Paris, where he was living at the time of the *coup d'état*, in 1851, he decided to enter his father's bank. His stay in Paris gave occasion to a series of very brilliant letters on the political condition of France under the prince president (as Louis Napoleon was at that time entitled), which were published in the *Inquirer* newspaper. They were in effect an apology for the *coup d'état*. After Bagehot's death they were republished in an appendix to the *Studies on Literature*. These letters gave the first evidence of the rise of a new critic of high genius, a critic who will take his place far above Lord Jeffrey, and Lord BROUGHAM, and Sydney Smith—though in mere humour Bagehot, humorous as he was, would hardly compare with the last-mentioned—in relation both to political literature and belles-lettres. Indeed, in belles-lettres Bagehot will take rank with Matthew Arnold as one of the two most lucid as well as most discerning critics of that time. The essays which Bagehot contributed, first to the *Prospective Review* and then to the *National Review*, between 1853 and 1864, were not merely among the most brilliant, but among the most remarkable for wide intellectual survey and a detached literary judgment of any published in England during those years. In style they were remarkable equally for their gaiety, for the delicacy of their apprehensiveness, for the *savoir faire* of a man of the world, and for the impartiality of their personal estimates. It is difficult to say whether he wrote best on a theologian like Bishop Butler, on a sensitive poet like Hartley Coleridge, on a

novelist like Sir Walter Scott, or on a great historian and essayist like Macaulay. Bagehot's style was buoyant, bright, and often eloquent, but there was always a certain dash of mockery in his eloquence, and a large infusion of seriousness in his mockery. In 1858 he married the eldest daughter of James WILSON, editor of the *Economist*, and two years afterwards succeeded his father-in-law in the editorship of that paper, retaining the post till his death in 1877. He was universally regarded as one of the best financiers of his day, and was consulted by successive chancellors of the exchequer on all critical occasions.

The special service which Bagehot sought to render to economics may be roughly described as the reconciliation of it with history. He was not himself able to perfect this work; but he has stated the needs of the case clearly, and has pointed the way to a solution of its difficulties. "The great want of our present political economy" (he says in the preface to *Universal Money*, 1869) "is that some one should do for it what Sir Henry Maine has done so well for ancient law. We want some one to connect our theoretical account of the origin of things with the real origin." Simple definitions come first in the text-books; but, as in physics, the actual commencements in history and experience have been much harder and odder. Banks, for example, are now part of a refined mechanism of credit, but they were first invented to supply a verified and trustworthy money for traders (*Universal Money*, p. xv. seq.)

No economical writer shows clearer consciousness of the enormous difference between the present conditions of European commerce and the conditions of life and industry among our rude forefathers; or, at the present day, among barbarous nations. He had always the twofold object before him—to perfect the abstract theory of political economy as applicable to the former, and to bring home to himself and his readers the existence of the latter. An abstract DEDUCTIVE METHOD seemed to him indispensable from the very complexity of the subject; but it was to be applied only to the study of the peculiarly modern "large commerce," which he loved to contrast with the simple industry of primitive men. Epigram, however, even more than antithesis, was his strength, if sometimes his snare. He was never at a loss for words, and he had a "gay wisdom," absent from economical writing since Perronet THOMPSON. He can hardly be taken quite seriously when he complains that MONTESQUIEU, HUME, and ADAM SMITH would have written more profoundly if the public for whom they wrote had not been so intolerant of dulness (*Econ. Stud.* p. 131).

Political economy, as he understands it, is not "a questionable thing of unlimited extent,

but a most certain and useful thing of limited extent" (*Econ. Stud.* p. 21). It is "a convenient series of deductions from assumed axioms which are never quite true, which in many times and in many countries would be utterly untrue, but which are sufficiently near to the principal conditions of the modern world to make it useful to consider them by themselves" (*Econ. Stud.* p. 157). Bagehot considers himself the last man of the ante-Mill period (*ibid.* p. 215); he thinks that J. S. MILL "widened the old political economy either too much or not enough" (pp. 19, 20). If he meant to carry on what Adam Smith and RICARDO had begun, and to give a theory of modern large commerce only, he has given us too much; if he meant to give a theory applying to all societies, "advanced" or not, he has given us too little. Bagehot had almost unbounded admiration for Ricardo, with whom, as at once business man and abstract thinker, he had many points of affinity. "The true founder of abstract political economy is Ricardo" (p. 151). Adam Smith discovered the country but Ricardo made the first map (p. 18). Ricardo, it is true, dealt in abstractions without knowing them to be abstractions, and fancied them the real things (p. 157). But it is by the method of Ricardo that Bagehot would build up the science. Two rival methods he mentions only to reject. The first is the "All Case Method," recommended by some theorists of the historical school, who tell us that before we begin to reason we must have "a complete experience." We might as well (says Bagehot) demand a complete record of human conversation as demand a complete record of commercial facts (*Econ. Stud.* pp. 11-14). The second rival method is the "Single Case Method," the advocates of which recommend that each group of facts, e.g. a commercial panic, be analysed separately on the merits, without any preliminary theory. But you might as well (says Bagehot) attempt to explain the bursting of a boiler without knowing the theory of steam. On the other hand the mathematical method (*ibid.* p. 15) of Professor JEVONS and Professor WALRAS is too abstract for him (pp. 15, 16); he hints that it explains *obscurum per obscurius* (p. 77). He thinks (with the latter rather than the earlier economists) that definitions must (very much, it may be added, as in Law) adapt themselves to the subject matter (p. 49).

His own definitions of wealth—(p. 81) and capital (pp. 49, 50) for example are on the whole on the old lines. Incidentally, in dealing with "Adam Smith and our modern political economy," he gives us his idea of what a treatise on political economy should contain. It should (he says) answer four questions—(1) What is the cause which makes one thing exchange for more or less of other things? (2) What are the laws under which that cause acts in producing these things (the laws, namely, of population and

capital)? (3) If these things are produced by the co-operation of many people, what settles the share of each of those people in those things or in their proceeds (the laws, namely, of distribution)? (4) If this co-operation costs something, who is to pay that cost, and how is the payment to be levied (the theory of taxation)? (*Econ. Stud.* pp. 99, 100.)

In considering his own answers to these questions we have to make some allowance for the incomplete state of much of his published writings. He had begun in the *Fortnightly Review*, 1876, a series of essays ("The Postulates of Political Economy") which were to have developed into three distinct volumes on political economy (see prefatory note to *Economic Studies*). The first was apparently to include the abstract theory and the complementary comparison with primitive life, the second a criticism of the works of previous economists, and the third a biographical sketch of them. Though he never carried out the whole plan, he has left us specimens of his work in all its three sections. The biographies include "Adam Smith as a Person," which is in his best manner. The criticism of previous economical work is acute; but, in the case where it is most elaborate (DEMAND AND SUPPLY, and COST OF PRODUCTION), it results (as he himself says of Adam Smith's reasonings) not in the "establishment of coherent truths," but in "a rough outline of sensible thoughts" (*Econ. Stud.* p. 119). His criticism (p. 138 *seq.*) of the theory of population is hardly consistent with his own general account of economical laws (e.g. p. 76). Like his father-in-law he was perhaps stronger in presenting the *axiomata media* than the first principles (*Literary Stud.* pp. 374, 375). He was one of the first economists in England to recognise the importance of the idea of development (which to him meant Darwinism) for social and economic theories; yet in most cases he is more careful to dwell on the contrast between the old and the new than to show how the one passed into the other or how the phenomena of the one shed light on the phenomena of the other. In one case, BARTER, where he has done the last very skilfully, his own results might have suggested to him the possibility of an abstract economical theory, even of exchange, by no means confined, as he has confined it, to the facts of the "great commerce" (*Econ. Stud.* p. 102). His conception of the process of mediating between the two extreme stages of culture, or in other words, passing from the "pre-economic" to the "economic age," is given in outline in his *Physics and Politics*, in which book (as even in the "Letters on the Coup d'État," and the pamphlet on "Parliamentary Reform") he shows the bent of his mind in his preference for economical illustrations, and his special note of the economical aspects of the subject in hand. Towards the

working classes and TRADES UNIONS he was never hostile; but he was not demonstratively sympathetic. His sympathies lay with the capitalist-employers;—the people who “spend their minds on little else than on thinking whether other people will pay their debts” (*Econ. Stud.* p. 45) have seldom found a more brilliant spokesman. The book by which he will always be best known to economical students is undoubtedly *Lombard Street, a History of the Money Market*. No more vivid picture of “what they do in the City,”—no more perfect description of a “Single Case,” was ever given; the author is “in the secret,” and can vouch for the facts at first hand. The wonderful clearness of Bagehot’s power of statement, his exact knowledge of the subject treated on, together with his firm grasp of economic theory have caused this volume to exert an influence which few books on a subject naturally so dry have possessed. The first sentence gives the key-note, “I venture to call this Essay ‘Lombard Street,’ and not the ‘Money Market,’ or any such phrase, because I wish to deal, and to show that I mean to deal, with concrete realities.” The promise of this opening is abundantly fulfilled. The character of thought in the “City,” the ceaseless movement of men and business, the reasons which led to our money market being arranged and worked as it is, the relative position of the Bank of England to the other banks, the results of Government interference with banking, are all treated with the vividness of one who felt every vibration of these varied currents in every fibre of his own life. The reform Bagehot recommended in the government of the Bank of England has not yet been carried out, but a proposal so original as the appointment of a permanent head to an institution which, since its formation, some two centuries since, has always been managed on the principle that the head should never be permanent, could hardly be expected to win acceptance on its first suggestion. Events since Bagehot wrote have shown more distinctly even than in his time the prudence contained in a proposal apparently so revolutionary. “Lombard Street,” perhaps more than any other of Bagehot’s works, shows how greatly Economic Science gains when those who are “conversant with its abstractions” are in “true contact with” the facts with which it deals. On the advantage the knowledge hence arising gives the economist, Bagehot not only wrote but constantly spoke during his life, with a vigour and an insistence which those who knew him will continually remember, and which those who read him will be able in some measure to appreciate. The papers on the “Depreciation of Silver” and on “A Universal Money” were also on a congenial subject. In the latter he advocated the farthing plan, or

the reckoning of 1000 farthings instead of 960 to the English sovereign, thus making the sovereign equal to five dollars and the half-penny equal to the cent. This, he thought, would at least provide the Anglo-Saxon races with a common money of account.

In the volume on the *Depreciation of Silver*, Bagehot discusses the position of England, France, India, and the United States, in view of the falling gold price of silver in 1876.

The cause of the fall, in his opinion, was not an actually increased supply of silver but the apprehension of an increased supply, together with the inconstant proceedings of the German and French governments (pp. 51, 52). He lays stress on the fact that Indian prices have not risen in response to the fall (p. 54, etc.) Yet he refuses all remedies but *laissez-faire*; we must simply give silver a free course, and in the end the prices will rise in India, and the previous condition of trade and finance there will be restored (*Depreciation*, pp. 40, 55, etc.) Changes in currency should never be introduced except when trade is in its normal condition (p. 113). In regard to BI-METALLISM he deals far too hastily with the arguments which tell in its favour as an abstract theory; he scouts it both as an abstract theory and as a practical measure (*Depreciation*, pp. 11, 12, 13, 37, 110 *seq.* to 118). So in the papers on “Universal Coinage” he says bluntly: “The French coinage is based on a double standard, which is absurd” (p. 23). “The French is a symmetrical embodiment of imperfect principles; the English, a confused embodiment of the best principles” (p. 27). From his attitude to these and not a few other questions, Bagehot might be fairly set down as one of the last economists of the ante-Jevons period.

Perhaps the most complete of Bagehot’s works was the study of *The English Constitution*, which has been used as a text-book both at Oxford and in several of the universities of the United States, and translated into German, French, and Italian. He preferred very much the English constitution, with that complete fusion of the legislative and administrative powers which was effected by the relation of the cabinet to the House of Commons, to the American constitution with its careful separation of legislative and administrative powers, an arrangement which, in his opinion, resulted in making the people indifferent as to their choice of representatives who were so carefully restrained from exerting any dominant influence over the actual executive. Bagehot attached great importance to what he called the ornamental parts of the constitution, namely the throne and the House of Lords. Not that he regarded them as essential elements in the action of the state, but that he thought that without them the people of the United Kingdom would be far more restless, far more unwilling

to submit to political guidance, far more disposed to interfere mischievously in arrangements which they do not really understand. The "ornamental parts" of the constitution contributed, in his opinion, greatly to the safety of the whole, as they disposed the English people to defer to the opinions of the prosperous and wealthy classes, and to be on their guard against violent and needy adventurers. The whole discussion of the theory of the cabinet, as a constituent element in political philosophy, is of the highest value.

["Letters on the Coup d'État of 1851," written to the *Inquirer* (Unitarian organ), 1852, and reprinted in vol. i. of *Literary Studies*.—*Parliamentary Reform* (review of Newmarch on Electoral Statistics) reprinted, with additions, from *National Review* (Chapman and Hall, 1858).—*History of the Unreformed Parliament* (also from *National Review*).—*Estimates of some Englishmen and Scotchmen*, 1858, written for the *Prospective Review* and *National Review* and in great part reprinted in *Literary Studies* and *Biographical Studies*.—Many Articles in the *Economist*, 1860 to 1877.—*Physics and Politics, or Thoughts on the Application of the Principles of Natural Selection and Inheritance to Political Society*, 1872 (Internat. Scient. Series). See *Economic Studies*.—*The English Constitution*, 1867 (enlarged, 2d ed., 1872).—*International Coinage. A Practical Plan for Assimilating the English and American Money as a Step towards a Universal Money* (reprinted from the *Economist*) 1869, 2d ed. 1889.—*On the Depreciation of Silver* (from the *Economist*, 1876), 1877.—*Literary Studies* (with a biography of the author), ed. by R. H. Hutton, 2 vols., 1879.—*Economic Studies* (same editor), 1880.—*Biographical Studies* (same editor), 1881. (See also Ingram's *History of Political Economy* (1888) pp. 223 seq.; *Political Economy in England*, by L. L. Price, London, 1891, ch. vi., for remarks on Walter Bagehot's position as an economist.)]

BAILEE. A person to whom the goods of another are entrusted, either for custody or for other purposes. The most conspicuous class of bailees consists of the so-called common carriers of goods, viz. railway companies, steamship owners, and others whose business it is to carry goods from one place to another. They are subjected to a particularly stringent liability for the safety of the goods, but as a general rule bailees are liable for those losses only which occur in consequence of their negligence. A bailee who takes goods into his custody without being rewarded for doing so is called a gratuitous bailee.

BAILEY, SAMUEL, was born in 1791, the son of a Sheffield merchant, was elected a town trustee in 1828, and became known as the "Hallamshire Bentham." Failing to be elected as M.P., he applied himself to local affairs, and

left, when he died, 18th January 1870, over £80,000 to Sheffield. Besides some political pieces, he wrote—

A Critical Dissertation on the Nature, Measures, and Causes of Value, London, 1825, 8vo (a remarkable little volume, pointing out the inconsistencies of RICARDO, J. S. MILL, and DE QUINCEY in their theories of value).—*Letter to a Political Economist*, London, 1826, 8vo (reply to a notice of the previous work in the *Westminster Review*).—*Money and its Vicissitudes in Value as they affect National Industry*, London, 1837, 8vo.—*Defence of Joint-Stock Banks and Country Issues*, London, 1840, 8vo. H. R. T.

BAILEY, SAMUEL, ON VALUE. Bailey's "dissertation" on the theory of value requires separate notice. Known in metaphysics by his attack on BERKELEY's theory of vision, Bailey plays a similar part in economics, objecting to subtleties sanctioned by authority. Defining value as nothing positive or intrinsic, but merely the relation in which two objects stand to each other as exchangeable commodities, Bailey controverts through several chapters RICARDO's theory of real value and its corollaries. Bailey refuses to admit the antithesis of real and nominal value (*Critical Dissertation*, ch. ii.), the possibility of comparing the value of commodities at different periods (ch. v.), the Ricardian formula that the value of A in relation to B "depends on the comparative quantities of labour necessary for the production of it and B, and not on the greater or less compensation which is paid for that labour" (ib.), the distinction between value and riches (ch. ix.), and any measure of value of the sort desiderated by MALTHUS (ch. vii. *et passim*). Malthus, severely criticising the *Critical Dissertation* (*Definitions*, ch. viii.), contends that the writer, by his too narrow definition of value as relating to some definite thing, has missed the essential idea of value in relation to things in general. Upon Bailey's principles, "we must on no account say that butter has been rising during the last month." The controversy is now of some practical importance, as it has a bearing upon recent proposals for determining the variation in the value of money (in relation to things in general) by a TABULAR STANDARD or INDEX NUMBER (*q.v.*) in particular that standard which is based on wages. Of more purely historical interest are other observations, new perhaps when made (1825). Criticising Ricardo, Bailey disentangles different senses of profits (ch. iv.) He classifies valuables much as J. S. MILL (*Pol. Econ.*, bk. iii. ch. ii.); and remarking on the class of commodity which "admits of being increased by industry and competition, but only at a greater cost," observes—"The extraordinary profit out of which rent arises is analogous to the extraordinary remuneration, which an artisan of more than common dexterity obtains beyond the wages given to work-

men of ordinary skill" (ch. xi. p. 197). He complains that the Ricardians "attempt to give the science an air of simplicity which it does not possess." "Why persist in calling quantity of labour the sole determining principle of value" (*ib.* p. 217); instead of "the more accurate proposition that it is the principle cause" (p. 232). "What should we think of an assertion that coats are to each other in value as the quantities of cloth contained in them"—with the addition "that due allowances must be made for the different qualities of the cloth?" (p. 211). DE QUINCEY (*q.v.*) in his *Logic of Political Economy* has replied to Bailey (see RENT).

F. Y. E.

BAILY, FRANCIS, was born at Newbury in Berkshire, 28th April 1774, and went on the London Stock Exchange, 1799. He helped to found the Royal Astronomical Society, and retired from business in 1825 in order to devote himself entirely to astronomy. His revision of star catalogues ranks him among the greatest of modern benefactors to that science. He died 30th August 1844. Among other books he wrote—

The Doctrine of Interest and Annuities, London, 1808, 4to.—*The Doctrine of Life Annuities and Assurances*, London, 1810, large 8vo; again in 1813, 2 vols. 8vo, with Appendix, new edition, enlarged, by H. Filipowski, Liverpool, 1864, 8vo (the best work on the subject when first published, and still useful; French translation by A. de Courcy, 1836, 8vo).—*Account of the several Life Assurance Companies in London*, 2d ed., London, 1811, 8vo (reprinted from the foregoing).—*Tables for the Purchasing and Renewing of Leases*, London, 1802, 3d ed., 1812, 8vo. H. R. T.

BAINES, EDWARD, 1774-1848, descended from a family of Yorkshire yeomen, and at first apprenticed to the printing trade, became (1801) editor and proprietor of the *Leeds Mercury*, which became under him the leading Whig paper in Yorkshire. COBBETT (*Manchester Lectures*, 1832), calls him "the great oracle of the North." He was a zealous social reformer. In 1834 he succeeded Macaulay as one of the two members for Leeds, retiring in 1841. He wrote brief histories and gazetteers of the counties of York and Lancaster; his chief work being a standard *History of the County Palatine and Duchy of Lancaster* (Fisher, Son, and Jackson, London, 1836). He was also the author (aided very largely by his son Edward) of a *History of the Wars of the French Revolution* (2 vols. 4to, 1817), which was expanded after the close of the reign, by the addition of two volumes, into a *History of the Reign of George III.* (London, 1823). He visited OWEN at New Lanark in 1819 with OASTLER and Cawood, and helped to institute at Leeds a home colony on Owen's model. See *Life of Edward Baines*, by his son Edward Baines, London, 1851. J. B.

BAINES, SIR EDWARD, (1800-1890), second son of the preceding, is best known by his

History of the Cotton Manufacture (1835), which was originally written for his father's history of Lancashire, but expanded and separately published on the suggestion of M'CULLOCH (*Edinburgh Review*, No. 117). He wrote in 1826 a letter *To the Unemployed Workmen of Yorkshire and Lancashire on the Present Distress, and on Machinery*, published first in the *Leeds Mercury*, and afterwards, by order of the magistrates, very largely circulated as a tract through the manufacturing districts, and which was held to have had the happy effect of settling the minds of many whose opinions had been wavering. In the year 1843 he published *Three Letters to the Right Hon. Lord John Russell*, entitled "Reasons in favour of Free Trade in Corn, and against a Fixed Duty." In the same year he wrote *Two Letters to Sir Robert Peel on the Social, Educational, and Religious State of the Manufacturing Districts* (1843)—a criticism of the school clauses in Sir James GRAHAM's Factory Educational Bill, from the point of view of a Nonconformist, and as being too unreservedly in the interest of the employers. He succeeds in showing that the charges of depravity and ignorance made against the manufacturing districts of the north were largely exaggerated, and could in any case have been brought with equal justice against the agricultural districts of south England. In 1846 he wrote a series of twelve *Letters to the Right Hon. Lord John Russell* on the subject of the resolutions which resulted in the system of grants under the committee of the privy council on education, bearing on the analogy between "government protection to industry and government protection to *mining*,"—sifting the statistical evidences on which the proposals were based, both as to the actual position at home and the comparison with the conditions of the people. The results of various state systems of education on the Continent of Europe and in the United States. These and other letters were collected into a volume and published by a company in London for "cheap circulation" (1847). Again in 1871, as chairman of the educational department of the Social Science Association, at its annual meeting in Leeds, he delivered an address, subsequently published in London, *On the Position and Prospects of National Education*. In 1823 the first mechanics' institution in England was established; and in 1837, on the formation of the Yorkshire Union of Mechanics' Institutes, Baines was elected president, and for more than fifty years, in his annual addresses from the chair, he reviewed the position of scientific and technical education in this country (see Annual Reports of the Yorkshire Union of Mechanics' Institutes). In 1858, as president of the section of economic science and statistics at the annual meeting of the British Association for the Advancement of Science, at Leeds, his address was "On the Woollen Manufacture of

England, with Special Reference to the Leeds Clothing District," and it was published both in the report of the British Association and in the *Journal of the Statistical Society of London*, March 1859. He represented Leeds as a Liberal in the House of Commons from 1859-74, he took a leading part in modifying the proposals for taking the CENSUS for 1861, and notably against a census of religious opinions. He brought in a Borough Franchise Bill in 1861, and on moving the second reading (10th April), he traced the progress of the country, and notably of the working classes since 1831, in education, in providence, in temperance, and in morality; illustrating these, too, by the growth and the improved character of our periodical literature. The speech was said by Mr. Gladstone to have added a new chapter to the social history of the country. It was published in London under the title of *Progress and Reform*, 1831 and 1861.

BAINES, THOMAS, younger brother of Sir E. Baines (1806-1881), wrote on the *History of the Town and Commerce of Liverpool* (1852), On the *Agricultural Resources of Great Britain, Ireland, and the Colonies*, 1847, and on the *Present State of the Affairs of the River Plate*, 1845. J. B.

BAIRN'S PART OF GEAR. See LEGITIM.

BAKOUNIN, MICHAEL (1814-1876), the founder of anarchism, began life as a Russian artillery officer. Stationed in Poland, he conceived a disgust at the repressive measures he saw in force there, resigned his commission, and devoted himself to the study of philosophy at Moscow. He went to Germany about 1846, and became a Hegelian. In 1847 he was at Paris, and made the acquaintance of PROUDHON. Expelled from France, he returned to Germany and took a prominent part in the Dresden insurrection of 1849, for which he was condemned to imprisonment for life. He was handed over to the Russian authorities, and confined in the prison of SS. Peter and Paul at St. Petersburg for eight years. Then, in 1857, he was exiled to Siberia, whence he soon managed to escape to Japan. After passing through America and England he established himself in Switzerland. His subsequent history will be found under ANARCHISM (*q.v.*) He died at Berne 2d July 1876.

[É. de Laveleye, *Le Socialisme Contemporain*, 3me éd. 1885, pp. 227-239.] E. C.

BALANCE OF TRADE. "It often happens," says MILL, referring to the supposed mercantilist views on money, "that the universal belief of one age of mankind" "becomes to a subsequent age so palpable an absurdity that the only difficulty then is to imagine how such a thing can ever have appeared credible." It is generally found, however, on investigation that the "palpable absurdity" formed but a minor part of a system the rest of which is forgotten, but

which, as a whole, was, in the historical conditions of the case, not unreasonable. This is true especially of the doctrine or policy of a "favourable balance of trade." From the modern point of view we take it as axiomatic that, apart from other international obligations such as tributes and the like, exports must over a term of years pay for imports. No nation, it is held, can go on receiving from other nations quantities of real wealth, actual consumable commodities, without giving something in return. But the store of precious metals, and even the power of incurring debt, or of paying by previous commutations, would soon be exhausted with a constantly adverse balance, and accordingly produce must pay for produce, taking the term in its most general sense (*cp. H. Sidgwick, bk. i.*), so as to include services freights, etc. It is further argued that if a nation were to attempt to import more than its normal exports could pay for, there must soon be a drain on its money, and then directly or indirectly, by the QUANTITY THEORY (see MONEY), prices would fall. This fall would stimulate exports and place a check on imports until the balance was again restored. Under a system of approximately perfect competition it follows from the very nature of money that all EXCHANGE is ultimately BARTER, and that the flow of the precious metals from country to country is an effect and not a cause of the direction and extent of its foreign trade. A nation will always obtain under such a system enough of the precious metals to keep its prices at such a level that its exports will just pay for its imports; in other words, that the balance of trade will, if time is allowed for adjustment, be even. Accordingly nothing can seem more absurd, so far as trade is concerned, than for a government to attempt to get a permanent and constant excess of EXPORTS over IMPORTS in order that a balance may be due on the precious metals. For by a converse train of reasoning the effect of such an influx would soon be a rise in prices and a check on exports and a stimulus to imports until the natural rate of exchange was restored. Thus from the modern point of view the policy of attempting to obtain a favourable balance (or excess of exports) in order to obtain money seems not only palpably absurd, but on analysis quite impossible.

Yet in its origin this peculiar importance attached to the PRECIOUS METALS was by no means an absurdity, and the regulations intended to increase the amount of money in the country to a great extent achieved their object. In the Middle Ages we find the germ of the balance of trade system in what was very happily styled by JONES the balance of bargain system (*Jones, Political Economy*, edit. by WHEWELL). [Compare MERCANTILE SYSTEM; COMMERCIAL SYSTEM]. According to this primitive method the state, through its officials, attempted on every

bargain to obtain a balance in money (of silver or later on of gold). Thus, with certain material imports a certain amount of money must be brought in; the foreign merchant who came to the country to sell was obliged to "employ" the money he obtained in the purchase of English wares; the organisation of the STAPLE was used to the same end, and, in short, all kinds of devices by way of prohibition and encouragement were adopted so as to obtain a favourable balance in money. There can be little doubt (compare Schanz, *Englische Handels-Politik gegen Ende des Mittelalters*, etc.; Jacob's *History of the Precious Metals*; Jones, *op. cit.*) that this policy was at any rate partially successful, and that the country obtained more money than it otherwise would have done. But not only was this policy, to some extent at least, practicable, but under the historical conditions it appears to have been justifiable. In the Middle Ages CREDIT was almost unknown, and the rudimentary forms which appeared were strangled by the wide-reaching laws and adverse public opinion on interest. As a consequence there was often a real dearth of the precious metals, in a sense that to us is almost unintelligible. At the same time also it must be observed the whole economic progress of the mediæval period was bound up with the commutation of services and payments in kind into money payments (compare T. ROGERS on SCUTAGE in *Six Centuries of English Work and Wages*). Thus any scarcity of money was a real evil involving very real burdens, and it was good policy to obtain a favourable balance because money was a peculiarly important part of the fixed capital of the nation. In process of time the balance of bargain system gave place to the balance of trade, and nations took the place of individuals (see COMMERCIAL SYSTEM). Adam SMITH had no difficulty in showing that before his time this system had become antiquated and useless because the natural course of trade gave a sufficiency of money, and the accumulation of treasure was not desirable (even if possible) for furthering foreign policy. Money, in fact, had already lost its peculiar importance, and it was easy to show at any rate that if a favourable balance was desired, one country must be compared with the rest of the commercial world, and that the best policy was to buy in the cheapest and sell in the dearest markets, independently of the particular balance with individual countries.

Reverting to the modern position, it must be noticed that exports and imports form only a part (though with this country the most considerable part) of the international indebtedness (for a complete enumeration of items see Goschen's *Foreign Exchanges*, ch. iv.) There must also be taken into account "invisible" exports, such as freights, commissions, loans, expenses of government or individuals abroad,

tributes, interest, etc. It must be noted also that so far as the influx or efflux of the precious metals is concerned, it is not the permanent indebtedness but the need of payment at a particular time which is of importance. Thus the balance of indebtedness may for the time being be in favour of a country that is hopelessly insolvent (compare COMMERCE).

In conclusion it may be observed that even under modern conditions sometimes it is of real importance to the nation as a whole to have a favourable balance, or at least to be able to brave an unfavourable one, in other words, to check a drain of gold. In normal conditions the existence of a favourable balance (or a state of indebtedness in which money is due to the country) would simply mean that importers of foreign goods can obtain exporters' bills at a cheaper rate than usual owing to their relative abundance, so that favourable is construed relatively to importers, the same state of things being adverse to exporters, and practically indifferent to the nation at large. But at certain times a foreign drain becomes sufficiently serious to threaten the stability of the banking system of the country, and in technical language the "exchanges must be corrected." This can only be done, as a rule, either by effectively raising the rate of discount or by affecting the trade balance through checking imports and increasing exports (see EXCHANGES, FOREIGN; DRAIN OF BULLION). Apart from this occasional effect of an adverse balance from the banking point of view, the principal point to observe is the rightful interpretation of the causes of a certain purely trade balance. Thus for many years the imports into England of commodities have exceeded the exports, whilst with India the converse is the case. The explanation is to be found in the other elements of international indebtedness. It is a great error to argue at once that because there is an excess of imports the nation is practically living on its capital, for the other items in the account, especially interest on foreign investments and payments of freights, must be considered (see Sir R. Giffen, essay on "The Use of Import and Export Statistics" in *Essays on Finance*).

[For the historical treatment of the question compare Schanz, *op. cit.*, and Adam Smith's *Wealth of Nations*, bk. iv.—List, *National System of Political Economy*. The theory is given in all the text-books, but special attention may be called to Prof. Bastable's *International Trade*.]

J. S. N.

BALANCE OF TRADE (HISTORY OF THE THEORY).—The views of the earliest popular economists of England on the best manner of enriching the nation agree with the measures taken by the legislature and with the balance-of-bargain system, as enforced by the statutes of employment. "The holl welthe of the reame is for all our riche commodites to gete

owt of all other reamys therfore redy money; and after the money is brought in to the holl reame, so shall all peple in the reame be made riche therwith." (Clement Armstrong, *A treatise concerninge the Staple and the Commodities of this Realme*, 1530, ed. Pauli, pp. 32, 61).

But when the English merchants had broken down the power of foreign COMPANIES and had formed companies of their own, they sought after a rule by which to ascertain what advantages the regulation of commerce afforded to the nation taken as a whole. Even during the prevalence of the balance-of-bargain system, a rough rule for the policy on which the coinage should be based had been given by an officer of the mint, Richard Aylesbury, who thought that "provided the merchandise exported from England was properly regulated, that is, if no more of foreign commodities were allowed to be imported than the value of the native commodities which should be taken out, the money in England would remain, and great plenty would come from beyond the seas." *Rolls of Parliament*, vol. iii. p. 126; in Ruding, *Annals of the Coinage*, vol. i. p. 241. These views, put forward in 1381 by Richard Aylesbury, contrary to the then prevalent opinion (Cunningham, *Growth of English Industry and Commerce, Early and Middle Ages*, 1890, p. 354), were formulated anew and with success by the anonymous author of "A Discourse of the City of London." He shows that the increase of prices, which followed the influx of the precious metals from the West Indies had induced the gentry to "play the fermours, grasiars, brewers, or such like." This mercantile spirit must be guided by the experience of the merchant's daily practice. England being in need of foreign commodities, and having no mines of its own, "it followeth necessarily, that if we follow the counsel of that good old Husband Marcus Cato, saying, 'oportet patrem familias vendacem esse, non emacem' and do carrie more commodities in value over the seas, then we bring hether from thence: that then the Realme shall receive that Overplus in Money" (*A Discourse of the Names and First Causes of the Institution of Cities, and peopled Towns; and of the Commodities that do grow by the same; and namely of the City of London*, etc. (about 1578), in Stow's *Survey of London*, 1598, p. 450). William STAFFORD accepted these principles, adding, that the imported commodities should be "most apte to be either carried for or kepte in store," and he praised the bailiff of Carmarthen, who had forbidden a ship freighted with oranges to sell them (*A Compendious and Brief Examination*, ed. 1581. New Shakspere Soc. Ed., pp. 50, 54, 57). This rule of commercial politics has been accepted by John WHEELER (*A Treatise of Commerce*, 1601, pp. 7, 8) and by Gerrard de MALYNES, who seems

to have suggested the name of balance, saying that the prince should not suffer "an overbalancing of forreine commodities with his home commodities, or in buying more then he selleth." *A Treatise of the Cancker of England's Commonwealth*, 1601, p. 2. The underbalance of trade and the consequent scarcity of money he ascribed to the "undervaluation of our Money in Exchange," effected by the practices of the bankers. His erroneous ideas and those of Thomas MILLES concerning "merchandising exchange" (*The Customer's Replie*, 1604) were attacked by Edward MISSELDEN, who hoped to remedy this undervaluation of the coin by "raising" it (*Free Trade or the meanes to make Trade flourish*, 1622, pp. 103-105), similar views being expressed in the parliament (*Parl. Hist.* i. 1195); he calls, however, the balance of trade "an excellent and politique invention, to shew us the difference of waight in the commerce of one kingdome with another in the scale of commerce" (*The Circle of Commerce, or the Balance of Trade, in defence of Free Trade*, by E. M., 1623, pp. 116, 117). He considers poverty and prodigality as the causes of the present underbalance, the Dutch at once growing rich by manufactures and restraining the home consumption (pp. 132-135). These opinions were generally accepted even by FRAS. BACON (*Letter of Advice to George Villiers*, 1616; *Letters and Life*, ed. Spedding, vol. vi. pp. 22-49, and *History of Henry VII.* Works, vol. vi. p. 223), and King James I. (*Parl. Hist.* vol. i. p. 1179). As stress was laid upon the profit of exportation of manufactures, the uselessness of the prohibitions of the exportation of money and bullion became more and more evident. Commercial states like Tuscany and Holland, allowing its free exportation, grew rich, while those forbidding it, like Spain, became impoverished. This point was clearly elucidated by Lewes ROBERTS, *The Treasure of Traffike*, 1641, p. 77, and the whole doctrine, including the views on exchange as a symptom, not as an agent of trade, as Malynes had maintained, was most systematically explained by Thomas MUN in his posthumous treatise *England's Treasure by Forraigne Trade; or the Balance of our Forraigne Trade is the Rule of our Treasure*, 1664, who in his *Discourse of Trade* (new ed. 1621) had still advocated the statutes of employment. To him therefore the honour of its invention has often been ascribed. The obstacles to trade were for the most part caused by fiscal motives, and the Commonwealth sought to stimulate the exportation of English commodities by the Act of Navigation. The balance of trade was thought to be advantageous: by fetching the commodities from the immediate places of their production and by sending them to their best market, where they yield the greatest price, but above all by the cheapness of the exported manufactures and the reduction

of the price of labour (*The Advocate: or a Narrative of the State and Condition of Things between the English and Dutch Nation*, ed. 1651.) This programme was supported by the greatest economists of the end of the 17th century like PETTY, TEMPLE, LOCKE, having all the tendency to overwhelm the Dutch power. Another body of practical men inquired into the advantage of some special trades, among which the French and East India trade was found ruinous, as absorbing money and bullion, and giving in its stead but wines or spices. To these at a later date acceded the fear of Irish competition in the matter of wool. This pessimistic series of writers begins with S. FORTREY's *England's Interest and Improvement*, 1663; the author of *Britannia Languens*, 1680, and J. POLLEXFEN, *England and East India Inconsistent in Their Manufactures*, 1697, were its foremost champions. The commercial treaty with France in 1713 was a new matter of complaint. In the *British Merchant*, all the arguments against the underbalance are restated by Sir Theodore JANSSEN in his *General Maxims in Trade*, 1713, and by Joshua GEE, who afterwards put forward his views in *The Trade and Navigation of Great Britain consider'd*, 1729. "His writings," says HUME, "struck the nation with an universal panic, when they saw it plainly demonstrated that the balance was against them for so considerable a sum as must leave them without a single shilling in five or six years." Nevertheless, the creed of the balance of trade was shared not only by CANTILLON and Sir J. SREUART, bk. ii. ch. xv., but even by free-traders like Thomas Gordon, *The Nature and Weight of the Taxes of the Nation*, 1722, VANDERLINT, *Money answers All Things*, 1734, and the author of *An Essay on the Causes of the Decline of Foreign Trade*, 1743.

For some time, however, the belief in the doctrine had been shaken, partly by traders whose interest it was to refute its postulates, partly by the impossibility of giving the exact statistical statement of the balance, partly by the doubts raised by superior thinkers. One of the first, it seems, was the author of *Free Ports, the Nature and Necessitie of them Stated*, B. W., 1652. "All consultations whatsoever about trade, if free ports bee not opened and this wholesale or general trade bee not encouraged, do still but terminate in som advice or other about regulating our consumption; and have no other good at farthest, but preventional, that our Balance of Import exceed not our Export: which to confine ourselves to alone, is, on the other side a cours to short, as it will neither serv to rais the Strength of this Nation in shipping, or to Govern the Exchange abroad" (p. 8). But the first thorough refutation was given by Nicholas Barbon in 1690 and 1696 (see BARBON), and his influence is to be traced in the writings of Sir Dudley NORTH (*Discourses of Trade*, ed.

1691), who calls, evidently in reference to it, the balance of trade one of the current "politicke conceits in trade; most of which Time and better Judgment hath disbanded." The increase of manufactures had in opposition to the former opinion that "trade was the source of national riches" made way to the doctrine that the employment of population and labour was the primitive enriching power. "Land and labour," says therefore John BELLERS, "are the foundations of riches, and the fewer Idle Hands we have the faster we increase in value; and spending less than we raise is a much greater certainty of growing Rich than any computations that can be made from our Exportation and Importation" (*Essays about the Poor*, 1699, p. 12). These views, though far more mingled with mercantilist beliefs, were upheld by the author of *The Advantages of the East India Trade to England consider'd* (1701 and 1720), who pointed out, that the only rule of foreign trade should be "to get a greater for a less value," and by DE FOE, who while refuting the authors of the *British Merchant*, declared himself to be "a profess'd opposer of all fortuitous calculations, making estimates by guess work of the Quantities and Value of any Trade or Exportation" (*A Plan of the English Commerce*, 1728 (2nd ed. 1737, p. 232). This confession and the doubts raised by Bishop BERKELEY in his *Querist* (1735), *Queries* 555, 556, whether the rule of the balance of trade held always true, and whether it admitted not of exceptions, were indeed nothing new. For even DAVENANT, originally much devoted to these estimates (*Of the use of Political Arithmetic*, 1698, Works, vol. i. pp. 146-148), declared himself afterwards convinced that they were inaccurate for many important trades (*A Report to the Commissioners*, 1712, Works, vol. v. p. 382). Sir Josiah CHILD also stated, as Berkeley did, that by means of smuggling, and furthermore in the case of countries whose income was consumed by absentees, like Ireland, exports could exceed imports without enriching the people (*A new Discourse of Trade*, 1690, ch. ix.) The doubts which all these expressions of opinion fostered, paved the way for the overthrow of the system. This was accelerated by the flourishing state of English trade, which continued to prosper through the 18th century notwithstanding all the predictions of evil expressed by the balance-of-trade theorists.

The successful onslaught on the system made by Hume in his *Essays* (1752) is now a matter of history. In these he restated Barbon's assertion that an equivalent must be paid in an export for every import received. Hume's refutation of the balance-of-trade theory had a considerable influence on the free trade doctrines of the PHYSIOCRATS and also upon Adam Smith. The latter, like Barbon, controverted the theory on this subject which was laid down by Mun

and by Locke. Adam Smith also, in the preference he gave to the home trade, and in his opposition to the mercantilist views, shows an inclination to incredulity in relation to the theory of foreign trade. The manner in which Adam Smith thus placed himself in opposition to the commonly-accepted opinions of his time explains the fact that his criticism of the theory of foreign trade obtained, when it first appeared, comparatively few adherents. Even PITT, while proving the success of his policy by the growth of exports, said, when the authority of Adam Smith was quoted against him, that he considered "that great author, though always ingenious, sometimes injudicious" (*Parl. Hist.* xxxiii. 562-3). The questioning, however, as to the complete applicability of the theory gradually extended as the 18th century waned. After the successful peace of Paris in 1763 the fear of a drain of specie began to spread in consequence of the growth of indebtedness to foreigners; and though the balance of trade seemed favourable, new doubts were expressed whether the values stated of the goods exported were accurate (*The Present State of the Nation*, 1769; by W. Knox, secretary to George Grenville, pp. 65-67). The observations of Burke on this occasion, though professedly designed to prove the balance to be favourable, are very acute. Though not allowing the statement as to the certificated goods for re-exportation to admit of error, he concedes the possibility for free goods, exported without drawback and bounty; he remembers that the costs of freight and the profits of the merchant are not taken into account, that in the balance of the Irish and West India trades import and export both refer to one nation, and he ridicules those who held that the foreign imports were a loss without even considering that part of it which enters into production. (*Observations on a late State of the Nation*, 1769, pp. 34-38. Also his *Letters on a Regicidal Peace*, 1796, Works, vol. iv. p. 554). The refutation of the original theory of the balance of trade is justly ascribed to Adam Smith, and his predecessors in England, of whose principal works some notice has been given here. The work of Adam Smith was completed by Ricardo in his theory of international trade (see INTERNATIONAL TRADE; BURKE; ADAM SMITH; RICARDO) which has hitherto been the special domain of English economies.

[See Buckle's *History of Civilisation in England*, vol. i. pp. 210-212.—J. Janschull, *English Free Trade* (Russian) 1 part, Moscow 1876.—E. von Heyking, *Zur Geschichte der Handelsbilanztheorie*, Berlin, 1882.—W. Cunningham, *The Growth of English Industry and Commerce*, 1885, p. 362.—C. F. Bastable, *The Theory of International Trade*, Dublin, 1887, p. 164.—G. Schanz, *Englische Handelspolitik*, 1881.]

BALANCE-SHEET. The simplest form of

balance-sheet which a trader can require is the following:—

BALANCE-SHEET of		19	
Assets.		Liabilities.	
Debtors on open account	£4500	Creditors on open account	£2750
Stock in Trade	8250	Acceptances	1250
Balance at Bankers	1250	Other Liabilities	7000
Other Property	6000	Surplus or Capital	9000
	£20,000		£20,000

How much may depend, not only on the amount, but on the character of the various "assets" and "liabilities," is explained with great clearness in the *Country Banker* by Mr. George Rae, *Letter III.* on the "Testimony of a Balance-Sheet." Mr. Rae remarks on this: "A man's duly-certified balance-sheet is the one reliable voucher of his actual position; all other information that we can gain respecting him must be more or less at second hand and imperfect, and it may be delusive. But there is no mistaking the figures of an honest balance-sheet."

Mr. Rae writes especially from a banker's point of view, as a man in the habit of advancing money, sometimes in large sums, to traders, but the knowledge of what a man's own business position may be is often obscured even to himself by careless and slovenly book-keeping, and the habit of preparing an "honest" balance-sheet is essential to soundness of trade.

BALANCE-SHEET. (2nd statement.) A balance-sheet is a statement exhibiting the assets and liabilities of a concern, the capital invested in it, and the balance of profit and loss, or of income and expenditure, accrued to date of the account. If books of account are kept on a proper Double Entry System the debit and credit balances of the ledger will form respectively the credit (right hand) and debit (left hand) sides of the balance-sheet, and will agree in total. The capital of the concern will appear on the left-hand side, representing, subject to any balance of profit or loss, the excess of assets over liabilities. If the liabilities exceed the assets a balance of loss, which will more than absorb any capital, will appear on the right-hand side.

The term balance-sheet is sometimes erroneously applied to what are really statements of receipts and payments, as in the case of the accounts of charitable institutions; these last naturally and usefully take the form of a statement of income and expenditure for a period. No account covering a period of time, and not exhibiting the position of matters at a particular date, can properly be termed a balance-sheet.

A form of balance-sheet appended to the First Schedule of the Joint Stock Companies' Act of 1862 is a suitable one for such companies as have not special provisions with regard to the form of their accounts laid down in their articles of association. This form of account is as follows:—

Dr. BALANCE-SHEET of the Co. made up to 19 . Cr.

Capital and Liabilities.				Property and Assets.			
I. CAPITAL.	Showing :	£ s. d.	£ s. d.	III. PROPERTY held by the Company.	Showing :	£ s. d.	£ s. d.
	1. The Number of shares				7. Immovable Property, distinguishing—		
	2. The Amount paid per Share				(a) Freehold Land		
	3. If any Arrears of Calls, the Nature of the Arrear, and the Names of the Defaulters				(b) " Buildings		
	4. The Particulars of any forfeited Shares				(c) Leasehold "		
II. DEBTS AND LIABILITIES of the Company.	Showing :				8. Movable Property, distinguishing—		
	5. The Amount of Loans on Mortgages or Debenture Bonds				(d) Stock in Trade		
	6. The Amount of Debts owing by the Company, distinguishing—				(e) Plant		
	(a) Debts for which Acceptances have been given			IV. DEBTS owing to the Company.	The Cost to be stated with Deductions for Deterioration in Value as charged to the Reserve Fund or Profit and Loss		
	(b) Debts to Tradesmen for supplies of Stock in Trade or other Articles				Showing :		
	(c) Debts for Law Expenses				9. Debts considered good for which the Company hold Bills or other Securities		
	(d) Debts for Interest on Debentures or other Loans				10. Debts considered good for which the Company hold no Security		
	(e) Unclaimed Dividends				11. Debts considered doubtful and bad		
	(f) Debts not enumerated above			V. CASH AND INVESTMENTS.	Any Debt due from a Director or other Officer of the Company to be separately stated		
VI. RESERVE FUND.	Showing :				12. The Nature of Investment and Rate of Interest		
	The Amount set aside from Profits to meet Contingencies				13. The Amount of Cash, where lodged, and if bearing Interest		
VII. PROFIT AND LOSS.	Showing :						
	The disposable Balance for Payment of Dividend, &c.						
CONTINGENT LIABILITIES.	Claims against the Company not acknowledged as Debts						
	Monies for which the Company is contingently liable						

E. W.

BALBI, ADRIANO (an Italian Economist of the first half of the 19th century). Author of *Saggio di una statistica d'Italia*, published at Vienna in 1833. He was also the author of the following works:—

Bilancia politica del globo o quadro geografico-

statistico della terra, Padova, Zambeivari, coi tipi della Minerva 1833.—*L'impero russo paragonato alle principali nazioni del mondo* (in French), Paris, 1829.—*La monarchia francese confrontata coi principali Stati del mondo* (in French), Paris, 1828.—*Quadro politico-statistico dell'Europa, nel 1820* (in French), Lisbon, 1820.—*Saggio statistico*

sul Regno di Portogallo, paragonato agli altri Stati di Europa (in French), Paris, 1822, 2 vols. in 8vo.—*Ragionamenti di statistica e geografia patria*, Milano, Civelli, 1845, in 8vo.—*Scritti geografici, statistici e vari, pubblicati da diversi giornali d'Italia, di Francia e di Germania, raccolti e ordinati per la prima volta*, Torino, 1841-42, 5 vols. in 8vo. M. P.

BALDWIN, LOAMMI, born in Massachusetts 1780; an eminent civil engineer; died 1838. In his *Thoughts on the study of political economy as connected with the population, industry, and paper currency of the United States* (Cambridge, Mass., 1809, pp. 75) Baldwin advocated, as a remedy for the evils of the irregular currency of the time, that the state banks be consolidated, and that the capital of the United States Bank be extended. He favoured internal improvements in his country, and displayed more than ordinary appreciation of the use of statistics; he also advised that the United States census of 1810 should include a record of births, deaths, and marriages. D. R. D.

BALSAMO, PAOLO, born at Termini (Sicily) in 1763, died at Palermo in 1816. He was a priest who travelled for several years in Italy, France, and England. In England he became a friend of Arthur YOUNG, from whom he learnt a great deal. Arthur Young published some of the writings of Balsamo in his *Annals of Agriculture*; Broussonnet translated some into French and enriched others with commentaries. When Balsamo returned from England he became professor of political economy in the university of Palermo, and his teaching is clearly based upon Young's doctrines; he divides his course into political, theoretical, and practical agriculture, considers agriculture as pre-eminent, opposes state regulation of prices and every other form of state interference with production and commerce, and declares state help for the poor a calamity. His lectures exerted a great and salutary influence on his countrymen, although it was some time before he triumphed over their prejudices. His lectures were not only technical, viz. concerning methods of agriculture, but also political, as he insisted strongly on the necessity of giving the proprietor of the soil absolute certainty of possession and personal security, and of putting down brigandage and robbery. As to the technical part of his lectures, Balsamo recast it in conformity with the new doctrines of chemistry which were being discovered in his days. Having received an abbey from the viceroy Caramanico, he entered parliament as one of the clergy, and succeeded in passing a plan of radical reform in the system of taxation. The basis of revenue consisted of rents from properties of the crown, and of an intricate list of taxes called donations, which parliament had granted, and which weighed very differently on the different classes, and had each a separate machinery for collection. Balsamo succeeded

in substituting for all these taxes a proportional income-tax. He was rewarded by the government with a very rich abbey. A part of his writings is perhaps lost; a part was published in 1802 at Palermo, under the title *Memorie economiche ed agrarie riguardanti il regno di Sicilia*; another part was published after his death in a review called *Effemeridi scientifiche e letterarie per la Sicilia*, Nos. 8, 10, 11, 18, 24, 32. In 1804 he published a pamphlet on diseases of sheep, and in 1816 his *Principii di Agricoltura e di vegetazione per gli agricoltori di Sicilia*. Noteworthy is also his journal of a voyage through Sicily, published 1809, full of statistical information. In 1845 two volumes of economical writings were published at Palermo (tipogr. Muratori), under the title *Memorie inedite di pubblica economia ed agricoltura*. M. P.

BAMFORD, SAMUEL (1788-1872), son of a weaver at Middleton, Lancashire, after being a warehouseman in Manchester, and then a sailor in the coasting trade, finally settled down as a weaver at Middleton. His book, *Passages in the Life of a Radical*, 2 vols. 1841, is a valuable authority for the history of the condition of the working classes, and their political movements in the years succeeding Waterloo. He was all his life a strong radical reformer; and was more than once imprisoned for his part in political movements; but his maxim was always "hold fast by the laws," and he braved the loss of popularity by a remonstrance with the Chartists (*To the Hand-loom Weavers of Lancashire, and the persons styled Chartists*, 1839). His poems, especially those in Lancashire dialect, had a wide circulation. J. B.

BAN. Roumanian coin equal to 1 centime (100 bans = 1 leu). F. E. A.

BANALITES. The name given to the exclusive right of the lord in France to erect a mill, bakehouse, or wine press, and to compel his tenants or serfs to make use of them. As he had a monopoly, he could make what charge he pleased. The only provinces exempt from *banalités* were Flanders, Artois, and Hainault. These petty oppressions were a great source of discontent in the agricultural districts of France. This right, with so many others, was abolished in the famous session of the national assembly on 4th August 1789.

[De Tocqueville, *France before the Revolution*, note lxxvii.] R. L.

BANCO. The addition of this word to the name of a coin implies that the coin designated is an imaginary one representing only bullion of a certain weight. Before the introduction of the present German monetary system all large payments in Hamburg were effected by transfers at the principal bank, the unit of which was the *mark-banco*, a coin which did not exist, but which was supposed to be containing silver of a certain weight and fineness, and worth

1s. 6d. The aggregate deposits were held by the BANK OF HAMBURG in bullion or foreign coins. A similar system of transfers was formerly used in Amsterdam, and existed to a certain degree in the practice of the mediæval deposit banks in Italy. It is not used anywhere at present.

BANDINI, SALUSTIO ANTONIO, born 1677, at Siena, brought up as a soldier, preferred retiring into the country and giving himself up to agriculture. In 1705 he took holy orders, and became an archdeacon in 1723. He was president of the Physiocritical Academy, a society intended to promote natural sciences rather than literature.

In 1737 he wrote his famous essay on the Sienese marshes, *Discorso Economico*, offered in manuscript to the grand-duke Francis in 1739; but not printed till 1775 (*Prima edizione di Firenze per Gaetano Cambiagi stampator granducale*), fifteen years after Bandini's death (1760). A second edition was issued by CUSTODI, *Scrittori classici italiani di ec. polit.*, Milano, 1803, *Parte moderna*, Tomo I. Bandini's essay contains the following leading principles of political economy. (1) "Human nature gives its best when it can act unfettered; consequently, the fewer and simpler the laws the better."—(2) As a corollary from the preceding principle, "abolition of all vexatious taxes and reduction of state officials to a minimum."—(3) Abolition of laws regulating prices; "if proprietors and peasants grow rich through high prices of agricultural produce, so much the better for the consumers, because more produce will be produced for them."—(4) "The want of commercial and industrial liberty causes famines."—(5) "Laws against monopolies (natural) and corners are based on prejudices."—(6) Rapidity and facility of exchange, not abundance of money, are the causes of wealth.—(7) A single tax is easier and cheaper for all parties concerned than a great many; it ought to be imposed on land and farmed out.

The Sienese marshes, which Bandini hoped to reclaim by the adoption of these maxims, constitute the lower part of the province of Siena and about two-fifths of the whole of Tuscany. His maxims, neglected by Francis, inspired the policy of the grand-duke Peter Leopold of Tuscany, but the Maremma benefited by it only after the grandduke had charged the mathematician Leonardo Ximenes to investigate the hydrostatical problems of the case, and received a favourable report upon Bandini's suggestions.

[*Della fisica riduzione della Maremma Senese di L. Ximenes*, Firenze, 1769, nella stamperia di Fr. Moucke, in 4°. And, reply to a critic in 1775, *Esame dell' esame d'un libro sopra la Maremma Senese*, Firenze, 1775, G. Cambiagi.] M. P.

BANFIELD, THOMAS C. (first half 19th century). The most important of Banfield's writings is the *Organisation of Industry*.

Having lived some years in Germany, he was led to study the works of continental economists, then little known in England, and his book owes special debt to HERMANN and ROSSI. By the *Organisation of Industry* he means a graduated scale of industries, corresponding to a graduated scale of human wants, and depending on the axiom that the satisfaction of a primary want at once gives rise to a secondary; e.g. "in proportion as food grows abundant, the other wants rise in importance, and a constantly expanding series of desires is awakened, which are classified according to their different grades of pressure" (Lecture III. p. 60). The cheapening of the means of satisfying the more urgent wants creates savings, which are necessarily spent in satisfying the second—an argument for free trade. His criticisms of other economists (e.g. RICARDO) are not always convincing, and his own definitions are not always precise. But his remarks on commercial history and on the economical features of his own time are often acute and suggestive.

Professor JEVONS, in his *Political Economy* (1871), has pointed out some passages where Banfield has, in some degree, anticipated the main theorems of that work.

Sic Letters to Sir Robert Peel on the Dangerous Tendency of the Theory of Rent advocated by Ricardo, 1843.—*Four Lectures on the Organisation of Industry*, delivered at Cambridge, 1844, published 1845. Translated into French, by Émile Thomas, 1851.—*The Progress of the Prussian Nation*, since 1805 (from Dieterici), *Journal of Statistical Society*, 1848.—*The Statistical Companion* for 1848, 1850, etc. (T. C. Banfield and C. R. Weld).—*The Industry of the Rhine in Knight's Weekly Volumes*, 1846, 1848.—*A Letter to W. Brown, M.P.*, on his system of Decimal Coinage, 1855.—Articles in the *Mining Journal*.

BANKING

Bank of England, p. 92; *Banks*: England and Wales, p. 93; Scotland, p. 95; Ireland, p. 96; India and Australian Colonies, p. 97; Bank of France, p. 97; *Banks*: France, p. 98; Bank of Germany, p. 98; *Banks*: Germany, p. 98; Chartered Banks in Scotland, p. 100; Banks in Canada, p. 100; United States National Banks, p. 102; Early European Banks—Amsterdam, p. 104; Genoa, p. 104; Hamburg, p. 105; Middelburgh, p. 106; Rotterdam, p. 106; Sweden, p. 104; Venice, p. 103; Land Banks, Germany, p. 106; Popular Banks, Germany, p. 109; Do., Italy, p. 109; Savings Banks, p. 110; *Bank Notes*, p. 111; Laws in different Countries, p. 112; National Banks U.S., p. 113.

BANKS, UNITED KINGDOM. The business of banking, generally speaking, consists in taking money on deposit, and also, in issuing notes and drafts, by which the transfer of loanable capital is facilitated. The funds thus obtained, together with those supplied by the capitals of the banks themselves, are employed in making advances, in the discount of bills, and in investments in first-class securities, such as the public funds; some part being kept in cash to meet current requirements. The

proportion to be employed in these methods depends on the circumstances of each individual bank. No absolute rule can be laid down. The judgment of the banker is shown in the use he makes of the capital intrusted to him. In a general way the maintenance of a reserve of resources immediately available, to the extent of a third of the liabilities, may be regarded as adequate. The assistance which a judiciously worked system of banking gives to the economic development of a country is enormous; it enables capital to be transferred from those persons by whom, and from those places where it is not required for active use to those requiring it. Both sides, the borrower and the lender, gain from the operation. The one obtains some interest for his money when placed on deposit—the spare cash which he does not need for immediate use. The other obtains the aid of an instrument of credit which enables him to carry on his business, and which would otherwise be out of his reach. The following observations apply to the principal countries in which methods of banking exist.

BANK OF ENGLAND. The Bank of England was founded in 1694 by act of parliament (Ways and Means Bill) of 1694, 5 William and Mary c. 20. It afforded an immediate and powerful support to the government, and also to the inland trade of the country. By its original constitution it was authorised to deal in bullion and bills, to issue notes, and to make advances on merchandise. At that period, and for a long time afterwards, the issue of notes formed a very large part of the business of banking. To trace the development of the Bank of England in detail here would extend beyond the limits to which these remarks must be confined. The Bank has rendered very important services to the government in times of war and difficulty, and also to the trade and commerce of the country.

The charter under which it was founded was periodically renewed till it was superseded in many respects by the Bank Act of 1844. In the interval between its foundation and that date the most important event which befell the bank was the suspension of specie payments 1797-1821 (see **BULLION COMMITTEE, REPORT OF**). At the present time the Bank of England forms the centre of banking operations in the United Kingdom. Three principal reasons have led to its holding this position. These are, that it is the issuer of the only note circulation which is legal tender, that it is the banker of the government, and also of the other bankers of the country. Owing to the last-named circumstance the reserve of the Bank of England is, practically, at the present time, the only unused money in the country available for any sudden demand, either of a domestic or a foreign character. The position which a bank so circumstanced holds is unique; and hence,

though less distinctly now than in former years, the bank rate of discount is regarded as the authoritative guide to the current rate of discount. That it is less distinctly a guide now than formerly is due to the fact that modern arrangements have placed enormous sums, as deposits, in the hands of other banks; still the pre-eminence of the Bank of England is generally recognised, and in any time of difficulty or distrust its actions are watched with the most sedulous anxiety, and it is not too much to say that at such times the fate of the commercial prosperity of the community lies in its hands.

The constitution of the governing body of this powerful institution is very simple. The court of directors numbers twenty-six. This includes the governor and deputy-governor and twenty-four directors, chosen from the old-established firms in the city. Custom has excluded English bankers from this body, but members of the powerful firms employed in negotiating foreign loans and in foreign bill-broking are considered eligible. The directors are practically self-elected. The respect due to the high position they hold has been well maintained by the high standard of character observed. The Bank of England, acting as agent of the government, naturally becomes the holder of the bullion reserve of the country, as by law the bank is bound to receive all gold bullion offered to it of standard value, at the price of £3 : 17 : 9 an ounce, retaining the practical difference of 1½d. between this sum, and £3 : 17 : 10½ the mint price (see **MINT**), as a remuneration for its trouble. Importers may, if they prefer, take the **BULLION** direct to the mint and receive new coin at the rate of £3 : 17 : 10½ an ounce for it themselves. But the trouble of doing so, and the delay which always ensues, causes the bullion to be brought to the bank by preference. Here it makes its way to the issue department and forms the basis of the note circulation of the bank for the amount beyond that allowed to be issued on securities. For the connection between the bank note circulation and the other operations of the bank (see **BANK NOTE**). As a bank the Bank of England receives large amounts of deposits, on which it allows no interest whatever. Suggestions have often been made that it should do this, but, were the bank to compete with the other banks in this manner, it is hardly likely that the other banks would continue to keep the large balances they do with it. These balances are always large. No statement respecting them has, however, been published since 1877, but at times they have exceeded the reserve. The balances of the London bankers are held with the bank in connection with the clearing house transfers (see **CLEARING HOUSE**). As a discounter of commercial paper the business of the bank is largely exceeded at present by other financial institutions, but it is

still the ultimate resort of all who want to borrow and find other banks closed to them—at times a large section of the business community. The importance of this position will be readily understood.

The following table, from the *Banking Almanac* of 1901, shows the average minimum rate of discount of the Banks of England, France, and Germany for the years 1844-1900.

Year.	Bank of England.	Bank of France.	Bank of Prussia.
	Per cent. £ s. d.	Per cent. £ s. d.	Per cent. £ s. d.
1844	2 10 0	4 0 0	4 6 0
1845	2 13 8	4 0 0	4 7 0
1846	3 6 6	4 0 0	4 14 0
1847	5 3 6	4 19 0	4 17 0
1848	3 14 5	4 0 0	4 13 0
1849	2 18 7	4 0 0	4 1 0
1850	2 10 1	4 0 0	4 0 0

1892	2 10 7	2 13 11	3 4 1
1893	3 1 0	2 10 0	4 1 5
1894	2 2 3	2 10 0	3 2 6
1895	2 0 0	2 2 0	3 2 7
1896	2 9 8	2 0 0	3 13 3
1897	2 12 8	2 0 0	3 16 3
1898	3 4 10	2 4 0	4 5 1
1899	3 15 0	3 1 5	5 0 5
1900	3 19 3	3 4 8	5 6 6
Average from 1844-1900	3 10 10	3 11 11	4 5 2

When divided into periods of ten years the averages are as follows:

¹ Since 1876 the Imperial Bank of Germany.

Average minimum rate of discount of the Bank of England, Bank of France, and Imperial Bank of Germany, 1844-1900.

Years.	Bank of England.	Bank of France.	Imperial Bank of Germany.
	£ s. d.	£ s. d.	£ s. d.
1844-1853	3 3 4	3 18 8	4 6 4
1854-1863	4 10 2	4 10 4	4 7 11
1864-1873	4 3 8	4 3 3	4 13 10
1874-1883	3 5 5	3 4 8	4 3 9
1884-1893	5 4 10	2 18 9	3 14 9
1894-1900	2 17 8	2 8 10	4 0 11

It appears hence that the English money market has, on the average of fifty-seven years, been cheaper than either the markets of Paris or Berlin. For the last thirty-seven years, however, the value of money in this country has, on average, been above that in France.

ENGLAND AND WALES. The origin of banking in Germany may be traced even further back than the habit of depositing money with the London goldsmiths, which was in full vigour by the end of the 17th century. Banking in the provinces was at the outset more dependent on the issue of notes than that of the metropolis, which naturally resulted from the difference of its field for operations. The history of the bank of Dundee may be taken as an illustration, for in this the habits of Scotch and of English provincial banks may be regarded as a good deal similar (see BANKS IN SCOTLAND). The early employment of credit in this manner led to results which govern, or at least largely influence, the banking system of this country to the present day. The value ascribed to the power of issuing notes led to the act of 1708, which restricted the number of partners in banks of issue, and virtually in all banks, to a number not exceeding six during the continuance of the Bank of England. This restriction lasted till the year 1826, when the establishment of joint-stock banks of issue was permitted; it was further modified by the act of 1862, which allowed private partnerships, not being banks of issue, to have ten members. The Act of 1833, however, prohibits any English joint-stock bank of issue from possessing a banking office in London. The act of 1844 restricts the privileges of issuing notes to those banks whether private or joint stock, which possessed the privilege at that date. The main object of the early legislation was to secure a monopoly of issue to the Bank of England. Incidentally it has served to prevent English banking from taking its proper development. In this the act of 1844, the latest of Sir Robert PEEL's acts dealing with monetary questions, has also assisted. His object in this was to cause the note issue of the country to centralise on the Bank of England, and to provide that, with the exception of the notes allowed to be issued against securities, an equivalent value in the precious metals should be held against

the amount in circulation in the case of the notes issued by that bank (see BANK NOTE). Through the restrictions imposed on dealing with the power of issuing notes by this act, the existence of a considerable number of comparatively small banks of issue was continued in England long after the time when, judging by the analogy of events in Scotland and Ireland, coalition into larger concerns would have been desirable. It is not necessary to refer here to the detail of our banking system. It may be sufficient to remark that in hardly any other country are the positions and circumstances of individual banks so widely different from each other as in our own. It is to be regretted that the attention of the legislature in England has been directed mainly to the note issue, with a view to centralise it, and that so little has been given to other points of more importance to the wellbeing of the banking system. Some provincial banks, both private and joint stock, possess the privilege of issuing their own notes, but this power can only be exercised by those who possessed it before the year 1844. The majority of the banks in England and Wales, including the largest and most important banks, do not issue their own notes. The act of 1844 fixed the maximum circulation of the country banks in England and Wales at

£5,153,417 (207) private banks,

3,478,230 (72) joint-stock banks,

but of this amount

£4,005,479 (173) private banks,

1,972,308 (46) joint-stock banks,

have since lapsed from various causes, voluntary and other, so that the limit of the provincial issues now (1901) stands at

£1,147,938 (30) private banks,

1,505,922 (26) joint-stock banks.

The banking business of England and Wales is now carried on by about 22 private and 104 joint-stock banks. The different banks vary much in size and importance. By the side of very large banks, wielding immense amounts of capital and deposits, very small concerns, possessing proportionally small resources, may be found carrying on business to advantage, and competing successfully with their more powerful rivals. One result, and it is a very peculiar one, of the manner in which our banking system has developed itself, employing the Bank of England as the pivot of its transactions, is that no bank in the country keeps any large stock of the precious metals in reserve—more, in fact, than habit has shown to be adequate for daily requirements, except the Bank of England. By this method economy in use of metallic money has been greatly promoted, with corresponding advantages to the community. The necessary drawback to this is that in times either of panic or of foreign de-

mands for bullion, the strain on our banking system becomes extremely sharp, and the troubles of the time greatly intensified (see DRAIN OF BULLION and CRISIS). The reserve of the Bank of England appears to those outside the business to be “idle money,” but no portion of our monetary resources really has so important a part to play, or is so entirely “employed” as the bankers’ balances, which figure in that reserve, and sometimes exceed it in amount. Through the agency of our system “English capital runs as surely and instantly where it is most wanted, and where there is most to be made of it, as water runs to find its level.” The ramification of our banking system to every small town and village enables our monetary resources to be economised to the utmost, thus persons requiring advances, whose position justifies their being made to them, are enabled to obtain the advantages which the use of capital will afford, both in remote places and in our larger commercial and industrial centres. The extension of banking throughout the provinces of late years has been very marked. The total number of offices of banks in England and Wales which was 1927 in 1876, has now reached a total of 4741. The deposits in the banks of England and Wales are estimated at the same date as about £640,000,000. The aggregate number of banking offices in the country generally was over 6500 at the same date, while the deposits in the banks of the United Kingdom, which were estimated as being about £470,000 000 to £480,000,000 in 1879, were estimated in the *Bankers' Magazine* as being about £798,000,000 in 1900. This is exclusive of the deposits held by the Bank of England, which were about £34,000,000 in 1879 and £47,000,000 in 1900. The publication of accounts is still not universal though far more general than formerly. No official statistics of the aggregate exist. No doubt in some cases undue credit has been given to those who have not been deserving of it, with disastrous results (see CRISIS). In some, but fortunately much rarer instances, the fraudulent have been assisted, or the banks themselves been ruined, by bad trading. But on the whole these results have but seldom occurred, and the prosperity of the country has probably been promoted fully as much by the banking system it has possessed as by any modern adaptation of physical science to the comforts and conveniences of life.

Some banks in the provinces allow interest at a low rate on the daily balances of their customers in their hands; but the more general rule is to make an allowance of interest only on sums placed specially on deposit. This interest usually varies according to the “London” rate for the time being; but some banks allow a fixed and uniform rate. The practice varies in different localities.

SCOTLAND. Considered historically, the distinctive peculiarities of banking in Scotland arose from the fact that, unlike their neighbours in England, the people were allowed by the legislature absolute freedom to create whatever system of banking they found best suited to their wants. Thereupon, before the days of railways and steamboats, every district of the country, however remote, appears to have developed its banker by a process, as it were, of "natural selection." He was the trusted custodian of the savings of the thrifty. He was, on the whole, the discreet and sagacious supporter of the enterprising trader and adventurous man of commerce. His promises to pay gold on demand were readily accepted within his district as a convenient medium of exchange. There was no state bank, no corporation with exclusive privileges. In this way, from the end of the 17th century, there grew up throughout the country substantial private copartneries conducting the business of banking and serving the important purpose of promoting industry and thrift. At this time the currency doctor had not yet appeared, and the subtle suggestion had not yet been made that a one-pound note, convertible into gold on demand, might be of less value than the coin it represented and for which it could at any moment be exchanged.

The range, however, of banking credit enjoyed by these substantial copartneries was naturally limited to the districts in which they were known, and when facilities of communication and of transit were increased and the scale of commercial transactions became enlarged, it became obvious that banking institutions of more commanding importance and more widely recognised stability were required to take the place of the old local private banks. The three old banks in Edinburgh—the Bank of Scotland, Royal Bank of Scotland, and British Linen Company—had not yet seriously set themselves to serve the country districts. A new chapter was accordingly opened early in the 19th century when joint-stock banks were formed, having their headquarters in Edinburgh, Glasgow, and some of the other more important towns, with numerous branches throughout the provinces. This proved to be the knell of the private banks, for by degrees these ancient institutions, being free to transfer themselves in their integrity, were merged in the more powerful joint-stock banks, and the system of banking as a whole became adapted to the enlarged operations of commerce.

The movement thus described involved, among other consequences, a reduction in the number of banks in Scotland. In 1819 there were 36; in 1844, 24; in 1873, 11; in 1890 there are 10. All possess the power of circulation, the limit to each of authorised note issue is as follows:—

NAME OF BANK.	Amount of authorised Circulation.
1 Bank of Scotland	£348,418
2 Royal Bank of Scotland	216,451
3 British Linen Company	488,024
4 Commercial Bank of Scotland	374,880
5 National Bank of Scotland	297,024
6 Union Bank of Scotland	454,346
7 Aberdeen Town & County Bank	70,133
8 North of Scotland Banking Co.	154,319
9 Clydesdale Banking Company	274,321
10 Caledonian Banking Company	53,434
Total	£2,676,320

The average circulation of these banks, allowed by the Acts of 1844-45 to exceed the authorised limit (see BANK NOTE), was, collectively, £7,949,000 in 1900, and their deposits about £108,000,000.

The development of banking in Scotland was greatly assisted by the provisions of the law, which placed no limit on the number of partners, and allowed security to be taken on land, all being registered, as well as on other descriptions of a debtor's property, with great facility. The private fortune of every partner was also liable for all the debts of the bank except in the case of the Bank of Scotland and the two chartered banks. The effect of this last provision has been restricted by the application of the limited liability acts, but the system of banking thus established, assisted by the power of circulating small notes, has extended itself over Scotland with great completeness. Hardly any village is without the advantage of banking facilities, provided by numerous branch offices. The early history of the Bank of Dundee may be taken as typical of the growth of Scotch banking. Originally instituted, 1764, as a bank of issue, it was not till 1792 that deposits were received by it, and these were for some time hardly equal in amount to the note circulation. A similar system was no doubt the origin of banking in the United Kingdom generally. Though the branch offices of the Scotch banks are numerous, the banks themselves, as stated above, are few in number. Amalgamation for the most part, failure in some conspicuous and terrible instances, account for the diminution. The credit of the remaining banks has never been shaken. The deposits, 21 millions in 1826, were 30 millions in 1851. Since that date the growth has been most rapid. Including capital, the resources were 63 millions in 1866, 92 in 1872, and more than 130 millions in 1900. The old practice of the banks in Scotland of making advances on CASH CREDIT (*q.v.*), that is on the personal security of two bondsmen, tended to develop the energies of the country facilitated by the thriftiness of the people. The system of note circulation in Scotland (see BANK NOTE) has been of great assistance to the banks in many ways, and has provided the banks with "till money" free of

cost. Through its existence the early prosperity of the banking system of the country was developed and fostered; it has caused great economy in the use of specie, and also it has facilitated book-keeping by removing the necessity for the use of small cheques in many directions. The vast network of branch offices, the working of which, as previously mentioned, is facilitated by the use of small notes, is also of great service to the business. In those districts which are poor, and where deposits are scanty, the advances of capital required for the development of business are easily provided from the resources which the wealthier districts supply. The small number of banks in Scotland, however, is sometimes made the subject of complaints. The habits of the people, which lead them to prefer notes to specie in their daily transactions, coupled with the other advantages which the possession of a note circulation gives, have practically restricted banking in Scotland to banks of issue, and as no addition to the number of issuing banks has been possible since Peel's acts of 1844-45, the existing banks have such a hold of the field that no increase has been made since that time. The rates of discount for advances, and those for the allowance of interest on deposit are settled by agreement among the banks; hence they are practically uniform over the whole of the country. While complaints as to the monopoly of the existing banks are thus heard from time to time, it does not appear probable either that the rates of interest charged, or allowed, would differ much, if at all, from those which have been the rule in Scotland under existing circumstances, if the freest competition were established. Nor is it at all likely that any one to whom an advance may safely be made is prevented from obtaining such an advance through the limitation of the number of the banks. Hence the public may not gain wherever such competition is started; on the other hand competition, in the direction of making advances on insufficient security, or to those who employ them in rash speculation, is one of the most disastrous things which can happen.

Two bank failures in Scotland during recent years have been on a scale so large as to deserve special notice. The aggregate loss of the shareholders of the Western Bank of Scotland, failed 1857, was upwards of £2,800,000. The failure of the City of Glasgow Bank in 1878 involved its shareholders in a loss of about £6,000,000. In neither case were the general public losers (see BANKS, CHARTERED; CASH CREDIT).

BANKING IN IRELAND has been conducted generally on the same principles as in Scotland, and hence requires no detailed notice. One point, however, to the great credit of the Irish banks, deserves commemoration, namely, that at the present time of writing (1901) every bank of issue in Ireland which was in existence in 1844

is still carrying on business. The stability which this indicates has not occurred in either England or Scotland. The exceptions to the general prosperity were the stoppage of the Tipperary Joint-Stock Bank (1856), and of the Munster Bank (1885), since replaced by the Munster and Leinster Bank, Limited. This general soundness of recent banking in Ireland may well be contrasted with its laxity, frequently involving consequent failure, at an earlier date. At the commencement of this century, Ireland was overspread with a number of small and principally very ill-managed banks, each carrying on its affairs within a narrow circle, and in a most irregular and unsound manner. The appendix to a parliamentary report (Report of the House of Commons Committee on circulating Paper, Specie, and Current Coin in Ireland, 1804) contains a list of the names of fifty firms, all believed to be engaged in the business at that time. Others who issued notes for small amounts from 3 $\frac{1}{2}$ d. to 6s. each, who had really no pretensions to be called bankers at all, undertook similar responsibilities. By the year 1820, however, only six of the banks were left, the numbers having been reduced principally by failures. The over-issue of notes had led to great distress. The want of confidence resulting from the frequent failures was general, and even the notes of the Bank of Ireland were for a time un-negotiable. The act of 1820 which permitted the establishment of joint-stock banks, gradually led to the sounder state of affairs mentioned above, but it was not till the amending acts of 1824-25 allowed persons resident in any part of Great Britain or Ireland to become shareholders in these banks that their success became established, as the previous exclusion of English and Scotch capitalists had greatly retarded their welfare (see *History of Banking in Ireland* by Mr. Dillon). The experience of Ireland in banking matters has been very chequered, the injury caused by the earlier and unsound banks having been very considerable, while the assistance given in recent times by the existing banks to the general prosperity, has been equally marked. It only remains to mention the *Bank of Ireland*. This bank was originally projected 1695, but the plan was not carried out then; it was also rejected by the Irish House of Commons 1721, and it was more than half a century afterwards, 1783, that the bank was established. It has been prudently and successfully conducted to the present date. THE SUSPENSION OF CASH PAYMENTS, 1797, extended to Ireland, and a very considerable expansion of the note circulation—over-issue it might more properly be termed—followed. This, however, was soon reduced after the return to cash payments.

Considerable privileges were granted to the Bank of Ireland—after 1820 no bank with more

than six partners was allowed to issue notes within a radius of fifty (Irish) miles from Dublin. After 1845 this restriction was removed, and the arrangements as to the circulation of notes practically assimilated to those in force in Scotland (see BANK NOTE). There are nine banks in Ireland, of these six possess the power of circulation.

NAME OF BANK.	Amount of authorised Circulation.
1 Bank of Ireland	£3,738,428
2 Provincial Bank of Ireland	927,667
3 Belfast Bank	281,611
4 Northern Bank	243,440
5 Ulster Bank	311,079
6 The National Bank	852,269
Total	£6,354,494

The average circulation of these banks, allowed by the Acts of 1844-45 to exceed the authorised limit (see BANK NOTE), was, collectively, £6,864,000 in 1900. The Hibernian Bank, Limited, the Munster and Leinster, Limited, the Royal Bank of Ireland, Limited, have no issues. The total resources of the nine banks were about £67,000,000 in 1900.

INDIA AND THE AUSTRALIAN COLONIES. British India, our colonies generally, and the Australian colonies in particular, possess well-developed banking systems. These do not, however, possess features calling for special notice from an economic point of view, except that with other very similar associations the banks in the Australian Colonies, whose deposits collectively were, in 1899, £140,000,000, have been, to a large extent, the conduit pipes through which British capital has been diffused throughout the colonies. Their rapid development may be cited as one of the advantages hence resulting.

FRANCE. The Bank of France, the most important banking institution in the country, was founded in 1800 as a private company, and received the basis of its permanent constitution, which made it practically a state bank, through the law of 24 Germinal An. xi. of the First Republic (14th April 1803). The law of 22d April 1806 reconstituted the bank, which is now regulated by the law of 1897. The governor, who holds his office for life, and the two deputy-governors, are appointed by the state. The general council, consisting of fifteen regents, by whom the business is mainly directed, and three censors, who may be regarded as a permanent committee of audit, are elected by the general assembly, which consists of the 200 largest shareholders. Of the regents, five must be chosen from among the manufacturers, traders, and merchants (*manufacturiers, fabricants, ou commerçants*) who are shareholders in the bank, and three selected from amongst the *trésoriers-payeurs généraux*, the treasury agents

in the provinces. Thus the government is strongly represented on the managing body. The governor has to watch that "the bank performs its duty to the state and towards the commerce and industry of the country" (evidence given by M. Rouland, then governor, before the *Enquête sur les principes et les faits généraux qui régissent la circulation monétaire et fiduciaire*, Paris, 1865, which see). The governor of the Bank of France has usually been a man who has held a high official position. Thus M. Rouland had been a senator, a minister, and president of the council of state; M. Denormandie, another governor, was a senator for life; and had M. Léon SAY, whose name was freely spoken of at a recent vacancy, and who has been minister of finance, besides serving in other high positions—for example, as ambassador in England—been appointed, it would not have been felt that this would have been a lowering of his official standing. The regents and censors represent the commerce and trade of the country, to which, as well as to the state, the bank has rendered great services. It has now 126 branches situated in the different departments of France; besides this about 265 places have, through auxiliary offices and other similar arrangements, banking facilities provided for them; 8 district offices in Paris also assist the operations. The rules of the bank with respect to its discounts are somewhat strict, three signatures being required, or a deposit of security to take the place of the third name, but the wisdom of the rules has been justified by the results. Thus, with a discount in round numbers of 17,000,000 bills in 1900 for an amount of nearly £490,000,000, only about £380,000 remained practically overdue, and of these the greater part was sound. The part the bank occupies in the general business of the country is shown by these figures, and as more than 2,300,000 of the bills taken at Paris alone were for sums below £4, retail trade as well as larger trade, shares in the advantage. Business in France is, however, not connected so intimately with banking as in England. Thus the note circulation of France, amounting to 160 or even 170 millions sterling, never now below 155 millions, represents a business turnover which would be conducted principally by cheques in England. The Bank of France, however, endeavours to extend the use of cheques among its customers. Through the *Bureau de Virements* it performs the functions of the CLEARING HOUSE (which see), and it likewise facilitates the transmission of money between the towns in which the branches are situated and the head office. The Bank of France endeavours to keep an even rate of discount with as few alterations as possible, as it considers a tolerable degree of certainty in the charge for the use of money to be, as is undoubtedly the case, of service to trade. Thus for about five years, between 1883 and

1888, its rate of discount remained at 3 per cent, while there were no fewer than 36 changes varying from 2 per cent to 5 per cent at the Bank of England during the same time. The rate charged is uniform at Paris and the branches, both for discounts and advances, the latter being from $\frac{1}{2}$ to 1 per cent above the discount rate. These rates are invariable, and no addition is made by way of commission or otherwise. Of the total operations of the bank, which in 1900 were about 746 millions sterling, a large part originates at the branches. At some of these, particularly at Bordeaux, Lyons, Marseilles, Havre, and Lille, the transactions are large. Some of the smaller offices, however, occasionally do not pay their expenses, and the cost exceeded the profits at 11 in 1900. This fortunate position of affairs has not been completely maintained since, but the deficiencies have been comparatively small. The Bank of France is at liberty to pay its notes and discharge its obligations either in gold or in silver of legal tender, that is, in silver pieces of 5 francs. It is argued that this facility assists it to maintain a comparatively even rate of discount, even in the face of a movement in the foreign exchanges favourable to an export of gold, as it is absolutely at liberty to give or withhold gold so long as it has silver with which it can cash its notes. This argument can hardly be proved or disproved statistically. As a matter of fact the number of alterations in the rate of the Bank of France has been fewer since the year 1844 than at either the Bank of England or at the Bank of Germany. The rate of discount has been on average more even than at the Bank of England during the last fifty-seven years, taken as a whole (see Table, BANK OF ENGLAND), and it has recently tended to be lower. In making these observations, however, the great difference between the condition of circumstances in the countries concerned should be borne in mind. Besides assisting commerce and the general prosperity of France, the Bank of France has more than once in its history had to support the weight of very serious troubles, the proper handling of which exceeded in difficulty almost any ordinary financial crisis. Without going farther back than the last forty years, specie payments have been suspended twice owing to political disturbances—in 1848 and again in 1870. The earlier of these suspensions, which lasted only about a year and a half, does not appear to have had any marked effect on prices. The later one, which was accompanied by the devastation ensuing on the Franco-German War, lasted about five years, specie payments, suspended in 1870, having been partially resumed in 1874 and completely in 1875. A suspension of specie payments may naturally be expected to produce the ordinary result of inflation, shown in the foreign exchanges and in the price of commodities. But

the course which the Bank of France took in regulating its issue of notes, which became the circulating medium and were inconvertible, was so prudent and cautious that few, if any, of the dangerous results of a forced circulation of paper followed. There was, during the course of this time, a slight, but not large variation from the normal rate of the foreign exchanges, exemplified in the rate between Paris and London on several occasions, but it was slight, and if any alteration in the prices of commodities followed it was only small in extent. Great caution and prudence must have been needed to carry on the monetary affairs of a large country under such trying circumstances without involving it in the risks which usually follow on a forced circulation.

The following figures will give some idea of the ordinary business transactions of the Bank of France:—

1900. Aggregate of operations	£747,000,000
„ Bullion held—Gold	£93,000,000
„ „ „ Silver	£44,000,000
„ Bills discounted in Paris and branches	£490,000,000
„ Maximum note circulation	£168,000,000
„ „ current accounts	£25,000,000

Besides the Bank of France, there are many other large banks in the country, as the Comptoir d'Escompte, founded 1848, the Crédit Foncier, and Crédit Mobilier, 1852, the Crédit Lyonnais, 1863, the Société Générale, 1864, besides others, and many very wealthy and powerful private firms who carry on the practice of banking and the traditions of the *Haute Banque*, which rather corresponds to the business of wealthy merchants and high financial operators with us. The idea of banking, as carried on in this country, in the United States, and in several of our colonies, notably in the Australias, is, however, gradually gaining ground in France, and further developments in that direction may be expected.

GERMANY. Although the Imperial Bank of Germany does not occupy quite so commanding a position in that country relatively to the other banks as the Bank of France does within its own sphere of labours, it nevertheless stands pre-eminent among them in many respects. The present constitution of the bank of Germany is defined by the Bank Act of 1875, by which the Bank of Prussia was merged in the Imperial Bank, and by the acts of 1889 and 1899, which last gave the Treasury a much larger share of the profits. In arrangements for accounts, in number of offices,—331 in 1900,—in closeness of relations with the government, the working of the Bank of Germany corresponds very much with that of the Bank of France. There is, however, an important difference in respect of the note circulation (see BANK NOTE), to which, as the arrangements are dissimilar both from those in England and in France, it is desirable to refer. The Bank

of Germany is permitted to add to its circulation against securities the issue of any other issuing bank whose circulation drops. It is likewise permitted to exceed the legal limit, in 1875 £12,500,000, extended 1899 to £22,500,000, on payment of a tax of 5 per cent per annum on the total excess issue. The limit was exceeded twenty times during the year 1900, and for the greater part of that time the rate of discount was not raised above 5 per cent, nor was any extra pressure felt during the time. To those conversant with the effect experienced when the Bank Act of 1844 has had to be suspended in England, the smoothness with which this automatic arrangement acts is a sign of a corresponding absence of pressure on business of great advantage to the industry of Germany, and though the different circumstances of business there do not admit of an exact comparison with England, the question deserves more attention than has been given it. The Bank of Germany is, even more distinctly than the Bank of France, essentially a "state bank." The distribution of the profits (law of 1875, 1889, and 1899) is as follows: $3\frac{1}{2}$ per cent to the shareholders, then 20 per cent of the balance to reserve, till it reaches £3,000,000. Of the surplus, three-quarters to the state, and one-quarter to the shareholders. The $3\frac{1}{2}$ per cent, if need be, may be made up from the reserve. Under this arrangement the shareholders received in 1900 £657,625 being a dividend of 10·96 per cent, and the state £1,041,205 in addition to the Note Tax £125,883. The capital £6,000,000 in 1900 is to be raised to £9,000,000 in 1905. The German emperor appoints the president and council of the bank directory, whose office is for life, on the recommendation of the federal council, and the Government, through the Chancellor of the empire, exercises complete powers of control. The shareholders influence the management through a committee. As with the Bank of France, the arrangements as to rates of interest are uniform over the whole field of operation, and the facilities given by this, and by the action of the bank in the discount of commercial paper, as well as by the transmission of cash, etc., have given a great impetus to the prosperity of the empire. There are many other banks in Germany besides the Imperial Bank, some of which issue notes. This privilege has, however, been relinquished to a considerable extent, owing to the restrictions imposed on all banks of issue; they may not buy and sell securities for delivery, either for their own or for third account, nor may they accept any bills nor (1899) in some conditions discount below the Reichs-bank. The business of the non-issuing banks in Germany, besides ordinary account current transactions, consists in discounts, buying and selling securities, granting

advances to customers and also in negotiating loans for governments as well as private undertakings, a business which in this country is more in the hands of private bankers and finance companies. The banks also hold large deposits; yet this branch does not attain the same proportionate dimensions as in Great Britain, the amount of uninvested capital being smaller; and as interest is allowed on almost all balances, even if repayable on demand, the profit from this source cannot compare with the results obtained in this country.

The limits of space forbid detailed reference to several other banking systems both in Europe and elsewhere, but among these the Swedish Enskilda Banks may specially be referred to as possessing a very skilfully planned note circulation, the usefulness of which compares favourably with the systems of circulation in Scotland and the United States. The system on which the national banks of the United States, established 1863, were originally based, was connected with the financial measures necessitated by the terrible struggle between "North" and "South" which inflicted such heavy losses on the Union. A safe circulating medium was urgently required, and Secretary Chase recommended an issue of bank notes, secured by deposit of United States bonds worked by local banks, in preference to the issue of notes by the Government itself (see BANK NOTE; BANKS, NATIONAL, UNITED STATES OF AMERICA).

BANKS, CHARTERED (SCOTLAND).

1. The Bank of Scotland; founded by Scots act of parliament 17th July 1695, not by charter, though frequently called one of the chartered banks; a monopoly of banking for twenty-one years from 1695; a capital of £100,000 sterling, since raised to £1,875,000 (£1,250,000 called up), with power to issue £2,625,000 additional stock. 2. The Royal Bank of Scotland; first charter 31st May 1727 in pursuance of the imperial statute, 5 Geo. I. c. 20; eighth, 30th December 1829; capital £2,000,000, fully paid up; it is questionable how far a provision in the original charter of 1727 that each share of £100 is liable in five farther calls of £10 each is applicable to present shareholders. 3. The British Linen Company; charter 6th July 1746 as linen traders and manufacturers; banking business developed; charter 1806 (5th June) as bankers, capital £200,000; last charter 19th March 1849, authorised capital £1,500,000, whereof £1,000,000 issued and fully paid up. The above three are known as the chartered banks; they claim limited liability (see COMPANY for purposes of charter). The National and the Commercial Banks have also charters; the former 1825, the latter 1831 (bank founded 1810); in both charters liability stated to be unlimited. See Mr. Fleming's "Memorandum as to Banking in Scotland," Select Committee on Banks of Issue, 1875, reprinted in Henry Robertson's *Handbook of Bankers' Law* (Scotch). The three oldest, Bank of Scotland, British Linen Company, and Royal Bank, have always had or claimed a strictly limited liability: the two named above, in common with the remaining five Scotch banks, the Caledonian, Clydesdale, North of Scotland, Aberdeen Town and County, and Union, have been recently registered as limited liability companies, and now use the word "Limited."

A. D.

BANKS, CANADA. The history of currency and banking in Canada may be divided into four periods: (1) the French régime;—(2) from beginning of British government until establishment of first banks in 1817-18;—(3) from 1817-18 until confederation of provinces, 1867, banks being organised under provincial and royal charters;—(4) since 1867, the Dominion parliament having exclusive jurisdiction regarding banking.

A complete account of the first period, during part of which beaver and moose skins were recognised currency, wheat a legal tender, and the "card money" of the French governors formed the chief medium; and the second period when the coins of five other countries were legal tender, will be found in the writings of Mr. James Stevenson referred to below. During the second period unsuccessful attempts were made in 1792 and 1807-8 to establish banks, and in consequence during the war of 1812 government was obliged to create an army-bill office or temporary bank of issue.

From 1817 to 1825, however, two banks were established in Lower Canada (Quebec) and one each in Upper Canada (Ontario), New Brunswick, and Nova Scotia, all now doing business except one. During the rebellion of 1837-38 the banks in Upper and Lower Canada temporarily suspended specie payments under permission of an order in council.

Before dealing with the fourth period it is necessary to indicate the condition of banking and currency at time of confederation, 1867. There were thirty-nine charters, but only twenty-seven banks doing business. The charters expired at various dates from 1870 to 1892 and varied in accordance with views regarding banking in the different provinces. In Upper and Lower Canada (Old Canada) shareholders were liable for double amount of stock, except that there was one bank *en commandite*, the "principal partners" having unlimited personal liability. In most cases notes could be issued equal to paid-up capital *plus* specie, and government securities held. In New Brunswick charters had been granted without double liability but the principle was being insisted on in renewals, while in Nova Scotia in the opinion of some there was no double liability. In Old Canada and Nova Scotia as a rule total liabilities were restricted to three times, and in New Brunswick to twice the amount of capital. There was also one bank with a royal charter, head office in England, and shareholders not under double liability. The situation was further complicated by the "Free Banking Act," under which notes could be issued secured by deposit of government debentures, and by the legal tender issues of the governments of Old Canada and Nova Scotia. In 1866-67 two of the largest banks in Upper Canada failed, resulting in a very severe financial crisis.

Under these conditions, and after tentative legislation in 1867 and 1870, the first general bank act of the Dominion was passed in 1871 (34 Vict. c. v.). It confirmed the special features in the bank working under royal charter, and that with "principal partners" personally liable, and it will be understood in any statements hereafter regarding banks as a whole that these institutions are not referred to. As the charters of other banks expired they were renewed under the Dominion Act. The

first act extended all charters ten years, which practice has been followed thus far. There were various amendments during the first few years, but since then changes have been infrequent, except at the regular revisions in 1880 and 1890. The act hereafter referred to is that assented to May 1890, and to come in force July 1891 (53 Vict. c. xxxi.)

Constitution and Powers of Banks.—Banking in Canada is not absolutely free as in the United States. A charter must be obtained by application to parliament, and this of course could be refused. Practically, however, banking cannot well become a monopoly. The minimum subscribed capital permitted is \$500,000 (say £100,000), of which \$250,000 (£50,000), must be paid in, and the fact assured by the money being deposited temporarily in the finance department, after which, on compliance with other important requirements, the treasury board will issue permission to do business. Shares are held subject to what is known as double liability, *i.e.* in the event of the bank's assets being insufficient to pay its debts, a shareholder is liable for the deficiency to the extent of an amount equal to the par value of his shares, in addition to any amount unpaid on such shares. Shareholders do not escape the double liability by transfer, unless a period of sixty days has elapsed before suspension. There are elaborate regulations as to the constitution and duties of the board of directors, which cannot be fully explained here. Directors become personally responsible if dividends are declared impairing the capital, and no division of profits in any shape exceeding 8 per cent per annum is permitted, unless the reserve fund or rest equals 35 per cent of the paid-up capital. The act prescribes the form in which the directors' annual report to shareholders shall be made, and requires most comprehensive monthly returns to the finance department, which are printed and discussed in the leading newspapers. The finance minister may call for special returns from any bank at any time. A list of shareholders in all banks, with their holdings, is published by the government annually. A return of all dividends and balances unclaimed for five years is required annually, and in the event of a bank's insolvency such amounts must be paid over to government to be held for owners. The statute of limitations does not run as against depositors in favour of banks. There are numerous provisions as to a bank's power to take securities for loans. Banks may not lend upon security of real estate. The act abounds with heavy penalties for breach of its provisions.

Note Issues.—In the successive banking acts of the Dominion parliament banks have been empowered to issue circulating notes to the extent of the unimpaired paid-up capital. By the first act the noteholders had no greater

security than other creditors. At the renewal of charters (1880) the circulating note was made a prior lien upon all assets; and at the last renewal the banks, at their own suggestion, are in addition required to create in two years a guarantee fund of 5 per cent upon their circulation, to be kept unimpaired, the annual contribution, however, if fund is depleted, to be limited to 1 per cent. The fund is to be used whenever the liquidator of a failed bank is unable to redeem note issues in full after a lapse of sixty days. Notes of insolvent banks are to bear 6 per cent interest from date of suspension, until liquidator announces his ability to redeem. Banks are also required to make arrangements for the redemption at par of their notes in every part of the dominion. The change in 1880 was caused by the failure of a small bank with a circulation of about \$125,000 (say £25,000), paying all creditors only 57½ per cent. The change in the act about to come in force is due to the demand for a currency, which will pass over the entire dominion without discount under any circumstances. The history of banking in Canada since confederation shows no instance in which depletion of the guarantee fund would have occurred. Fines from \$1000 (£200) to \$100,000 (£20,000) may be imposed for over-issue of notes. The pledging of notes as security for a debt, or the fraudulent issue of notes in any shape, renders all parties participating liable to fine and imprisonment. As the crown prerogative to payment in priority to other creditors had been set up on behalf of both dominion and provincial governments, the act places the claims of the Dominion second to the note issues, and those of the provinces third. Notes of lesser denomination than \$5 (£1) may not be issued, and all notes must be multiples of \$5 (£1). Notes smaller than \$5 are issued by the Dominion government. With power on 30th June 1894 to issue \$61,559,473 (say £12,311,894), the banks had in circulation only \$30,241,711 (say £6,048,344). The average of assets including double liability, to secure each dollar was \$8.09 (say £1:15:0), the lowest individual average being \$3.56 (say 14s. 2d.). The circulation expands and again contracts during three months in each year as much as 20 per cent, owing to the products of Canada being still mainly of the forest and field. This fact, and the necessity for till money without cost at the branches, have caused Canadian bankers to steadily oppose a currency secured by special deposit of securities. During the period since confederation the banks have provided a currency readily convertible into specie, the volume rising and falling with requirements of trade, and this, apart from legal tender notes of the Dominion, is almost the only class of money in constant use. The amount of legal tenders in circulation is about

\$20,000,000 (say £4,000,000), of which over half is held by the banks, the balance representing change-making notes of denominations smaller than \$5 (£1).

Reserves.—No reserves are actually required by law. The cash reserve in gold and legal tenders has averaged for some years about 10 per cent. Till money is almost entirely supplied by the note circulation. The smaller banks keep their available reserve in deposits with the leading banks in Montreal. The larger banks have their immediately available reserves largely in security loans in New York and Chicago. Forty per cent of whatever cash reserve a bank may choose to keep must be in Dominion legal tenders, a provision entirely in the interest of the government.

Branch System.—Perhaps because the first bankers in Canada were to a great extent English and Scotch, the branch system has become so firmly established that but six or seven banks have no branches. Altogether there are about four hundred bank offices, including fifteen city branches in Toronto, administered by thirty-eight banks, the largest number by any one bank being forty-four, two other banks having about thirty. One of these has branches from Halifax on the Atlantic, to Vancouver on the Pacific, a distance of about 3500 miles. Any town of 1000 or 1500 people may thus have a bank of deposit and discount of high standing, and administered by a trained bank officer. Slowgoing communities where deposits accumulate, thus provide the means of satisfying the wants of new and enterprising localities, where the demand for money is out of all proportion to local supply. As a result of this economy in the distribution of capital, and the advantages arising from till money without cost, and the profits of circulation, rates of interest in Canada are as low or lower than in any country except the three or four leading nations of the world, and Canadian banks cannot go to Great Britain for deposits as other colonial banks do, because they cannot afford the rates paid by other banks. The proportion of deposits to capital is still so small (only two to one) that branch banking could not have reached its present comparatively perfect development, but for the note issues not being specially secured. It has been argued that if this power was taken away or replaced by a specially secured issue, perhaps one-half of the branches would have to be closed.

The following figures indicate the growth of banking in Canada, 1856 and 1860 being for Old Canada alone (taking the dollar as 5 = £1).

Year.	Capital paid-up.
1856	\$13,700,000, say £2,740,000
1860	24,400,000 " 4,880,000
1870	32,000,000 " 6,400,000
1880	60,500,000 " 12,100,000
1890	59,500,000 " 11,900,000
1894	62,000,000 " 12,400,000

Year.	Note Issues.
1856	\$10,500,000, say £2,100,000
1860	9,700,000 " 1,940,000
1870	14,100,000 " 2,820,000
1880	20,100,000 " 4,020,000
1890	32,000,000 " 6,400,000
1894	30,000,000 " 6,000,000

Year.	Deposits.
1856	\$8,600,000, say £1,720,000
1860	15,900,000 " 3,180,000
1870	50,700,000 " 10,140,000
1880	84,800,000 " 16,960,000
1890	136,200,000 " 27,240,000
1894	179,000,000 " 35,800,000

The total deposits in chartered banks, post office and government savings banks, Montreal and Quebec savings banks, and the real estate loan companies, was at 30th June 1887, \$183,756,329 (say £36,751,266), and is now over \$200,000,000 (say £40,000,000). The currency of Canada was declared by 34 Vict. c. iv., to be dollars, cents, and mills, similar to that of the United States. By same act the British sovereign is declared legal tender at \$4.86 $\frac{2}{3}$. The gold coins of the United States of \$5 and upwards are a legal tender. It has been proposed to establish a branch of the Royal Mint in Canada.

B. E. W.

BANKS, NATIONAL (UNITED STATES OF AMERICA).—The national banking system of the United States was established by an act of 1863, revised in 1864, and amended by later legislation. Its essential features are the issue of bank notes by local banks under national supervision, the deposit of United States bonds as security for all notes issued, and the limitation of the right of issue to the banks organised under this system. The original act was adopted, after repeated recommendation by Secretary Chase, as one of the leading financial measures of the civil war of 1861-65, partly as affording a market for the considerable mass of bonds required by the banks for deposit under this plan, but chiefly as a provision for reforming the paper currency after the restoration of peace. The direct issue of legal tender notes by the treasury of the United States, which had begun early in 1862, was looked upon as a temporary expedient, and the withdrawal of the notes and restoration of specie payments after the close of the war appeared not improbable. The national banks would then supply a convertible currency, amply secured, of uniform value throughout the Union, and there could be no revival of the vicious systems of issue under local authority from which the country had suffered deeply. It was also an important

consideration that in every state the banks of issue, having their capital invested in United States bonds, would find their interests identified with those of the union. A part of these advantages were lost by the delay in returning to specie payments (1879), the final recognition of the legal tender notes as a permanent currency, and the temporary decline of the national bank circulation (see BANK NOTE, UNITED STATES OF AMERICA). The adoption of the system, however, has given the United States a large class of banks in high credit, which have been of the utmost service in the development of the country. They carry on their business under strict regulations, precluding advances on real estate or on the security of their own shares, and forbidding any bank to lend more than the tenth part of its capital to any single borrower. For the protection of their deposits the law requires a minimum reserve of "lawful money" (specie or legal tender notes) of twenty-five per cent for city banks, and fifteen per cent for country banks. In case of insolvency the shareholders are liable to an amount equal to the shares held by them respectively. The banks are also required to publish their accounts at dates selected by authority five times in the year, and are under official inspection; and finally, the whole system is under the charge of the Comptroller of the Currency, who has large discretionary powers for the enforcement of all regulations. These arrangements have made the national banks the strongest class of banks in the United States, and, in the language of an official report, has confined their business, with general success, "to the collection, the safe-keeping, and the employment in temporary loans of the floating capital of the country." Their growth has been rapid. In 1864 there were 189 in operation with a capital of \$14,000,000 (£2,800,000); 30th June 1899 there were 3583, with capital and surplus \$947,187,079 (£189,400,000), and total resources \$4,709,000,000 (£942,000,000).

Other Banking Institutions.—Upon the establishment of the national banking system the greater part of the banks incorporated under the laws of the several states were reorganised as national banks. With others, however, the rights of issue did not outweigh some inconveniences of the national organisation, and there is now an important class of banks, and of loan and trust companies, organised under state legislation and carrying on a deposit and loan business. The regulations under which they work are necessarily diverse, and the amount of public supervision over them varies in different states. There is also a great number of private bankers receiving deposits and making loans, but ignored by legislation. The returns made by the incorporated banks and trust companies are not uniform enough to be accurate, and the number and business of the

private bankers can only be conjectured since the repeal of the tax formerly laid upon deposits; but the approximate statement by a comptroller of the currency (report for 1899) excluding savings banks, gives 9732 national banks, state banks, and private banks, with resources of \$9,905,000,000 (£1,981,000,000). The capitals of the banks aggregate \$973,611,975 (£194,700,000), surplus, etc. \$761,119,839 (£152,200,000), and deposits \$6,768,658,361 (£1,353,700,000).

The limits of space forbid reference to other banking systems, etc.

[For a concise account of banking in the United States down to the Civil War, see Report of the Comptroller of the Currency for 1876, p. 6, with tables p. 83-123].
C. F. D.

BANKS, EARLY EUROPEAN. The banks founded in earlier times in Europe carried on, for the most part, a rather different business than that understood at the present time under the title of banking. The BANK OF VENICE has often been traced (see ANDERSON, *Origin of Commerce*, vol. i. p. 156) to the forced loans raised by the republic in 1156, 1480, and 1510, the transfer of stock and the payment of interest taking place at a public office, which was subsequently made a deposit bank. Lattes and Ferrara, however, have made it certain that, although the stock, by its transfer, may have become an important medium of exchange, deposit banking in Venice was thoroughly established by private bankers in the 14th century, and that the first public bank, the Banco di Rialto, was opened by decree of the senate in 1587, in consequence of the frequent insolvency of the private banks. In 1619 the Banco del Giro, long known as the Bank of Venice, was established by a decree of which the text is given by Lattes, *Libertà delle Banche a Venezia*, p. 183. This bank, like its predecessor, was established without a capital and purely as a bank of deposit, under the management of public officers. It received funds both for the state and for individuals, making a small charge for holding private deposits; transfers were made upon the books by the order of depositors; bills of exchange were paid by such transfers; and the tender of payment in bank for any sum not less than 100 ducats could not be refused. Upon this plan the bank became an important aid to commerce, and was long famous throughout Europe. As it was not properly a lender, the bank should never have had less bullion than the amount of its deposits; but loans to the government compelled it to suspend payment more than once, especially 1717-39, and with some loss of credit. For the greater part of its existence, however, it received cash or paid it out, according to offer or demand. It kept its accounts in ducats *banco*, which had no corresponding coin, but were credited or redeemed by the bank, as

might be required, at an advance of 20 per cent above the ducat *effetivo* of the mint. Whatever the origin of this difference or agio, it seems finally to have represented a mere difference of denomination, as if the Bank of England were now to keep its accounts in guineas, using the current coin in all receipts and payments. The Bank of Venice declined with the republic, and at last fell, after the invasion by the French in 1797. It is some indication of the financial skill with which this bank was managed that the managers were able in 1766 to reduce "the interest of their funds to 4 per cent, at the same time offering payment of their principal to those who were unwilling to accept that rate of interest" (Macpherson, *Annals of Commerce*, vol. iii. p. 444). Next in importance to the Bank of Venice was the BANK OF GENOA, Bank of St. George. Banking institutions are mentioned by CIBRARIO as having existed as early as the 12th century. The Bank of St. George, which dates in the form by which it is generally known from 1407, besides being a bank of circulation and deposit, was also the financial centre of the republic, at which all the transactions in the public funds of the state were carried on. ANDERSON (*Origin of Commerce*, vol. i. p. 319,) says (in 1345) that the republic of Genoa had "run so considerably into debt to her own citizens that in this year four of them were elected to make provision for those debts, and for the current service of the year." Anderson, who, however, gives 1407 as the date when the bank was definitely established, states that in order to pay the interest on the debts of the state the customs were assigned to it. The council of the bank were one hundred, and the governors eight in number, "managing their stock prudently, and having many rich men concerned with them, they afterwards supplied the further necessities of the republic; and, for that end, had at length most of the cities and territories of Genoa pawned, or rather sold to them," . . . and (p. 414) "In proportion as the wants of the republic increased, so did the credit of this house or bank, by having still more bonds, rents, and important dominions assigned to it." The power of the bank of St. George increased, so that, according to De Mailly, whom Anderson quotes, there is "seen in the same city two independent sovereignties." The appropriation of its property, first by the Austrians, 1740, and afterwards by the French during their occupation in 1800, destroyed its credit, which till then had remained unimpaired. The BANK OF SWEDEN claims, and we believe truly, to have been the first established on modern principles as a bank which issued notes payable to bearers at sight. This bank was founded, 1656, by a Swede named Palmstruck. The first bank-note was issued 1658. An "enquête" made by the French government

in 1729, recognises the priority of Sweden in this matter, and declares the bank-note to be an admirable Swedish invention, designed to facilitate commerce (Palgrave, *Notes on Banking*, p. 87). This bank became the Riks bank (Bank of Sweden) 1688; it still carries on business in Stockholm, and has always been national property. The BANK OF AMSTERDAM, founded 1609, was established for a different purpose, namely to provide in these important commercial centres a common and permanently steady currency in which the foreign bills of exchange domiciled there might be paid, without that loss and inconvenience which a fluctuating currency caused. The establishment of the Bank of Amsterdam is described in some detail by A. SMITH (*Wealth of Nations*, bk. iv. ch. iii.) "Before 1609 the great quantity of clipped and worn foreign coin which the extensive trade of Amsterdam brought from all parts of Europe, reduced the value of its currency about 9 per cent below that of good money fresh from the mint. Such money no sooner appeared than it was melted down or carried away, as it always is in such circumstances. The merchants, with plenty of currency, could not always find a sufficient quantity of good money to pay their bills of exchange; and the value of those bills, in spite of general regulations which were made to prevent it, became in a great measure uncertain.

"In order to remedy these inconveniences, a bank was established in 1609 under the guarantee of the city. This bank received both foreign coin and the light and worn coin of the country at its real intrinsic value in the good standard money of the country, deducting only so much as was necessary for defraying the expense of coinage, and the other necessary expense of management. For the value which remained, after this small deduction was made, it gave a credit in its books. This credit was called bank money, which, as it represented money exactly according to the standard of the mint, was always of the same real value, and intrinsically worth more than current money." Payments were made in transfers of "bank money," which were equivalent to cheques. For the last century of its existence the bank adopted the method, also described by Smith, of making advances in bank money upon the pledge of coin or bullion deposited, the owner paying interest for the advance and receiving a *récépissé* to enable him to withdraw the pledged metal upon making repayment. This system, which has been much misunderstood (as by M'Culloch in his edition of the *Wealth of Nations*, p. 215), superseded the earlier practice of simple deposit, but appears to have equally answered the purpose for which the bank existed. The bank of Amsterdam rendered great services to commerce for more than two hundred years, but during the French occupation at the close of

the last century it was found that the bank had advanced very large amounts to the provinces of Holland and West Friesland, the Dutch East India Company, and the city of Amsterdam. The bank then became virtually insolvent, but the city finally paid the holders of bank money some time before 1802. Attempts were made to revive the bank, which languished until 1820, when it was at last closed.

The BANK OF HAMBURG was established 1619, for similar reasons to that of Amsterdam. To the prosperity of the trade of Hamburg, the most vigorous offshoot of the once powerful HANSEATIC LEAGUE (*q.v.*), the bank of that city largely contributed. It carried on its business under the protection of the state, and was a place of deposit, or warehouse of the precious metals—principally uncoined silver. Silver in bars was the true foundation of the bank's stock, coined silver, gold, and to a small extent copper were merely received as pledges with a margin. The "mark banco," or money of account, represented the $59\frac{1}{2}$ part of a metrical pound of fine silver. Any quantity of fine silver was received by the bank, and credit given for it at the rate of $59\frac{1}{2}$ mark banco for one pound of fine silver, 1 per mill ($\frac{1}{2}$ per cent) being charged to the person who sold the silver to the bank. Accounts could only be opened by a Hamburg citizen or corporation. In order to avoid any risk of loss, no silver was received under the fineness of $\frac{920}{1000}$, and every bar had to be assayed by a sworn assayer (*Wardein*) in the service of the bank. In this manner the payments to be made were merely transfers from one account to another by persons who kept an account at the bank. To transact their business they had either to appear personally or to be represented by an attorney. The person who appeared, whether the owner of the account or the attorney, had to hand over the check, which may more properly be described as the order for transfer, with a printed signature personally to the bank. One list for all the separate sums dealt with was handed in. Besides the business based on bar silver, the Hamburg bank also advanced bank money against silver coins, and in a more restricted way on gold, under careful regulations and for a limited time only. These loans, however, could be renewed. The pledge itself could only be taken out by the person who took money for it, or by another one to whom it was formally transferred (Palgrave, *Notes on Banking*, p. 116). The Bank of Hamburg continued to do business on these principles for many years. Modern methods of account, however, were gradually introduced. On 15th February 1873 the old system of a bank currency based on uncoined silver came to an end. The German currency was employed; the development of the Bank of Germany, and an establishment of a branch

of that bank in Hamburg, together with the alteration in the currency of Germany from a silver to a gold basis, rendered the continuance of the Bank of Hamburg no longer necessary, and its business was merged in that of the Bank of Germany. The bank had accumulated a capital of about 1,000,000 marks, or £50,000 besides the value of its buildings. The latest reference to its separate existence is found in the transactions of the senate of Hamburg of the 13th October 1875. In these, following the ancient practice of the free city, the senate formally communicates to the burghers its resolution to sell the buildings of the "venerable institution which had performed such great services to German trade" to the Bank of Germany for 900,000 marks (£45,000). The actual transfer took place on 1st January 1876. An agreement was likewise made that the officers and staff of the bank should be transferred on a similar footing to that which they had previously held to the Bank of Germany—seven being retained while five were pensioned by the State, including the two *Wardeine* (assay officers); and thus the bank which had carried on business to a later date than any other of the banks, established on what may be termed mediæval principles in Europe, closed its honourable and useful career. Dr. A. SOETBEER published (*Volkswirtschaftliche Vierteljahrschrift*, 1866-1867), a very interesting account of the Bank of Hamburg (*Die Hamburger Bank*, 1619-1866), which narrates its remarkable history. The soundness of the course of business followed, at all events from 1770 onwards, was exemplified in the strongest manner on the 5th November 1813. When on this date the French took possession of the bank treasure, 7,506,956 mark 6 schilling in silver, the corresponding liabilities were found to be 7,489,343 mark 12½ schill. only. So unbroken was the confidence in the institution that its operations were hardly interrupted even by this shock; the removal of the treasure by the French continued till 18th April 1814. After a further period of disturbance the freedom of Hamburg was re-established 1st June 1814. The bank immediately resumed business and the value of the mark banco stood as before. The tardy reparation in the form of an inscription of French rente of 500,000 fr. (equal to 7 fr. rente for every 100 mark banco taken away), was not made till 1816.

This, though the most severe ordeal the Bank of Hamburg had to pass through, has not been by any means the only one. There was a severe crisis in 1763, another in 1799, caused by violent fluctuations in prices, another in 1857, arising out of speculative business, the last-named being only allayed by a loan from Vienna, first of ten million mark, then of five million more in current silver (say £1,125,000). As not unfrequently occurs in panics, the knowledge that the means to meet liabilities were at

hand sufficed to calm the crisis, the identical coins being, as Soetbeer informs us, returned to the national bank at Vienna in the selfsame boxes in which they had been despatched. This loan was guaranteed by the senate of Hamburg. The amount of indebtedness liquidated was very large, the total being 144,586,600 mark banco—(say £10,844,000 reckoning the mark banco at 1s. 6d.) This amount is made up by the commercial failures *m.b.* 98 millions (say £7,350,000), the sum, collectively *m.b.* 21 millions (say £1,875,000), dealt with by the three Committees to which the State delegated authority to grant loans on bills, merchandise, and other securities, (1) the *Belehnungs Kommission*, *m.b.* 8,153,000 (say £611,475), (2) the *Staats Disconts Classe*, *m.b.* 3,020,549 (say £227,215); (3) the *Preussische Commission* for the first Austrian loan, *m.b.* 10,000,000 (£750,000); and the portfolios of the two joint-stock banks (*Aktien Banken*), *m.b.* 25 millions (£1,875,000). The loss which resulted to the state was comparatively small, being about 187,000 mark banco (say £14,025), and to the two joint-stock banks 200,000 mark banco (say £15,000). That on the 98 millions was unknown although no doubt this figure included some of the engagements represented by the portfolios of the banks. The interposition of the state alone prevented a terrible catastrophe.

Nothing could be more sound than the business of such a bank as that of Hamburg, which consists under ordinary circumstances only in transferring "value" from one holder to another. The experience of the bank shows that when severe pressure comes on, as in the crisis of 1857, the support of the government may enable these limits to be safely exceeded for a time, with great advantage to the community. Dr. Soetbeer supplies statements which show the rapidity and the fluctuations in the operations of the bank. The amount held by the bank was turned over during each year from 1856 to 1866 as follows:

Year.	No. of Turns.	Average rate of discount per cent.
1856	115	6½
1857	126	6½
1858	88	14
1859	50	2
1860	68	14
1861	88	2½
1862	111	3
1863	111	3½
1864	105	4½
1865	118	3½
1866	119	4½

The relation shown between rapidity of turnover and rate of interest is very remarkable. The fact that this is the case has been noticed by men of business, who would hardly have

expected so exact a statistical confirmation of their individual observations.

Similar in many ways to the Bank of Hamburg was the BANK OF ROTTERDAM (established 1635): one difference in detail appears to have been that accounts were allowed to be kept, either in "bank money," to meet bills drawn foreign on Rotterdam, or in "current money" to meet bills drawn in Rotterdam on foreign countries. Anderson (*Annals of Commerce*, vol. iii. p. 384) mentions another point, namely, that "bills of exchange are paid in large money, and only 10 per cent in schellings." The BANK OF MIDDELBURG (established in 1616) appears to have practised lending upon securities (Mees, *Bankwesen in Nederland*, p. 231), and so far to have departed from the usual type of deposit bank; but with this exception the scope of the business of all these banks appears to have been much the same, the management, where necessary, as at Venice and Genoa, of the debts of the state, and, further, providing facilities for foreign commerce. Assistance to local industry in the way of discounts and making advances does not appear, at first, to have been, at all events prominently, their original occupation and intention.

BANKS, GERMAN LAND. There are two species of advances which an agriculturist who owns the land he cultivates may require: (1) to increase the working capital needed to carry on cultivation, such as wages, purchase of stock, seed, or manures: (2) for permanent improvements in his property, as drainage, irrigation, and farm buildings. The return for the first should take place within one, or, at most, a very few years; for the second it will be fully realised only after a long period.

Distinct institutions have long existed in Germany to meet the demands for these two species of advances.

The first kind are sufficiently supplied, in the cases of the larger proprietors, by ordinary banks. For smaller proprietors there are in Germany, besides ordinary banks, institutions on the basis of mutual assurance. Such are the *RAIFFEISEN* loan fund societies, specially for the rural districts, particularly for the small landowners, to protect them from the exactions of the local usurers. These render effectual aid to the cultivators, lending somewhat larger amounts for long periods. They have had marked success in the Rhine-province of Prussia, in Westphalia, and in Hesse-Darmstadt.

For permanent agricultural improvements large sums become necessary, and loans can only be repaid gradually during an extended term. Germany was the first country in which special systems of credit for long periods on the security of landed property were organised. The oldest institution of this kind originated in Silesia in 1749, some time after the seven years war, under the auspices of Frederick the Great, who

gave it a subvention from the public purse of 300,000 thalers at 2 per cent. The plan was due to a Berlin merchant named Buring. The object was to relieve proprietors who were overwhelmed with debt, having suffered severely from the war, from the high rate of interest, and the low prices of agricultural produce. Similar establishments, known as *Landschaftliche Credit-vereine* or simply *Landschaften*, were afterwards founded in the other provinces of the Prussian monarchy, as well as in Württemberg, Mecklenburg, Saxony, and most of the other German states. They not only continue to exist, but have increased in numbers, and the system has since extended to Austria, Denmark, and Russian Poland.

They are voluntary associations of landowners, resting on the principle of joint responsibility. Any proprietor who borrows from an association becomes *ipso facto* a member of it. The security for the advances they make to their members is, in addition to the movable property of the borrower, his land and the buildings on it. The position of the association is usually that of first mortgagees. The associations carry on their transactions within limited areas; and this enables them to adapt their operations to the wants of the district, and, in particular, secures that the valuation of lands pledged for advances shall be made by persons thoroughly acquainted with local conditions and possessing the confidence of the agricultural community. They lend commonly at 4 per cent, *plus* a small contribution ($\frac{1}{8}$ to $\frac{1}{4}$ per cent) towards expenses of management; besides the annual payment applied to the extinction of the loan.

The associations in general do not pay the loan in money, but issue obligations (*Pfandbriefe*) for the amount advanced. These are negotiable, and pass from hand to hand, bringing the holder an interest paid by the association, yearly or half-yearly, of from 3 to 4 per cent. Payment of the principal of obligations cannot, in general, be claimed by the holder, but the association may agree to accept offers of them, and can call them in, usually by drawings, on giving due notice by advertisement. Not merely the property specially represented by the *Pfandbrief*, but all the funds of the association are liable for the regular payment of the interest. Each of the coupons into which an obligation is subdivided usually represents a very moderate amount, and they are used as a medium of exchange in small transactions. They have maintained their value extremely well in comparison with other debentures. Thus, for example, during the shock to commercial confidence caused by the revolutions of 1848, whilst the $3\frac{1}{2}$ per cent Prussian public funds were quoted at 69, and the shares of the bank of Prussia at 63 per cent, the $3\frac{1}{2}$ per cent *Pfandbriefe* stood, in Silesia and Pomerania at 93, in west Prussia at 83, and in east Prussia at 96; and

they have maintained their price well since. In some cases these obligations are issued direct to the borrowers, who themselves undertake their negotiation. In others the association charges itself with the negotiation and gives cash to the borrower, this being furnished by capitalists who invest in the obligations. No dividends are earned by the association. The receipts from the borrowers provide for the interest on the obligations, the maintenance of a reserve fund, the gradual redemption of the obligations, and the cost of management. In case the borrower fails to pay the interest on his loan, the association can first seize his produce and other movable effects, and if these are insufficient, can have a receiver appointed over the mortgaged estate, or can sell it by public auction. The debtor can, in general, pay off the debt at will, in full or by instalments of not less than a certain fixed amount.

The governments of the several German states commonly prescribe certain conditions (*Normativ-bedingungen*) under which these societies can be formed, and rules to which their operations must conform. The minister of the interior exercises a superintendence over their proceedings, usually through a commissioner who presides at the meetings of the members, and not unfrequently some of the directors are nominated, or their nomination is required to be approved, by the state.

Three conditions appear necessary for the safe and efficient working of such institutions. (1) There must be a public compulsory register of titles to, and charges on, land, so as to make the existing liabilities of an estate, or portion of an estate, easy to ascertain;—(2) ready and cheap legal methods for the recovery of debts and the sale of the borrower's property pledged for a loan;—(3) the obligations must be capable of easy and inexpensive transfer.—All these conditions are satisfied in the countries where such establishments have been successful. Further, there must be due care in the management of the institutions, and especially in valuation of mortgaged lands. When the *Landschaften* are under state control, it is generally provided by law that the loan shall be made only on first mortgage and to an amount not exceeding half, or at most two-thirds, of the value of the land. When application is made for a loan, if a previous mortgage on the land is found to exist, it is first, with the consent of the prior mortgager, paid off in obligations.

These institutions offer considerable advantages both to borrowers and lenders. To an agriculturist who has sunk borrowed capital in improvements, the liability to a sudden demand for repayment of the loan is particularly formidable; and that step may be necessitated by the condition of the creditor's affairs without any fault of the borrower. To the capitalist who lends, a more punctual payment of interest

is assured by the responsibility of the association than could in every case be expected of a private debtor. And he is saved the trouble of examining into the security of the borrower, all risk on that head being borne by the association.

All testimonies on the subject tend to show that the effect of these institutions has been socially beneficial. They have lightened the burdens of proprietors, have increased the market value of land, and have determined a more liberal expenditure on permanent agricultural improvements, thus tending to diminish the immigration from the country districts into the large towns. They have also opposed a useful counterpoise to the tendency towards excessive subdivision.

So far we have dealt only with institutions which may be described as *associations of borrowers*, who procure loans for themselves on the security of the whole or a part of their landed possessions, guaranteeing repayment of the loans by their collective responsibility. This was, as we have seen, the type of the early German *Vereine*; and these societies still exist and new ones have been founded on the same plan. But, besides these, other institutions have come into existence during the last half-century in Germany, as well as elsewhere, which may be distinguished as *associations of lenders*, for the purpose of making advances for long terms on the security of immovable property, land, houses, factories or workshops, woods, mines, etc. They have been created by capitalists as modes of investment. The establishments of this kind are more properly than the former called land-banks; they are known in Germany as *Hypotheken-Banken*. They possess a subscribed capital, and pay dividends to their shareholders. The bank is responsible, to the extent of its entire resources, to the capitalist who purchases its obligations. The subscribed capital bears but a small proportion to the amount of the obligations in circulation, so that the security to the holders of the latter rests essentially on the value of the mortgaged properties. The annuity paid by the borrower consists, as in the case of the *Landschaften*, (1) of the interest on the loan, with (2) a commission, and (3) the sum required for the extinction of the debt in the fixed term. The profit of the bank depends on the difference between the interest it pays to holders of its obligations and that it receives from its debtors. The issue of the *Pfandbriefe* of these banks is, in general, limited by legislation, or by direct action of the public authorities; the accounts of the banks are, in some states, required to be periodically submitted to the government.

A special stimulus to the formation of land-banks in Germany, as elsewhere, was supplied by the success of the French CREDIT FONCIER (q.v.), founded 1852. Placed at first under the surveillance of the state, afterwards (in 1854)

under the direction of high functionaries selected by the sovereign, that establishment had, after surmounting considerable difficulties in its early stages, obtained a position of stable credit, and had extended its operations over the whole of France. Foreign financiers and statesmen studied with care an organisation which had yielded such satisfactory results; and a powerful impulse was given to the creation of land banks in the other continental countries. In Germany, in particular, a great number of them were founded; five at Berlin between 1864-72, three at Frankfurt-on-the-Main between 1862-71, three at Munich between 1860-71, and others at Brunswick, Königsberg, Gotha, Mannheim, Hamburg, and Bremen, and in Silesia, Pomerania, Württemberg, Mecklenburg, Anhalt-Dessau, and Alsace-Lorraine. An establishment on the French model has also been created for the Austro-Hungarian monarchy. Some of these have named are also banks of ordinary discount. At the end of the year 1880 there were enumerated, as existing in the German empire, twenty-four *Hypotheken-Banken*, having in circulation more than 1700 millions of marks (£55,000,000) in *Pfandbriefe*, and holding over 1800 millions of marks (£90,000,000) in mortgage. Their share capital amounted to more than 250 millions of marks (£12,500,000).

Whilst the *Landschaften* were instituted and worked for the benefit of agricultural proprietors exclusively, it is said that the business of the *Hypotheken-Banken* has been principally in connection with town buildings.

Besides the voluntary associations of which we have spoken, the governments of some of the German states have from time to time founded land banks, entirely under their own management, for special objects. Thus in the parts of the country where feudal institutions continued longest in force, as for example in Hesse-Cassel and Hanover, they had been created (in 1802 and 1840 respectively) to furnish the proprietors of the "peasant lands" with the means of redeeming the seigniorial dues to which they were subject. And in recent times *Landcultural-Rentenbanken* have been founded by the governments of Saxony and Prussia, to assist landowners in draining and irrigating their estates.

[The bibliography of this subject is already very extensive. A long list of books on land credit will be found in C. Kules's *Gold and Credit*, 2te Abtheilung (1879), p. 325. The present writer has consulted, besides Kules's work, Theod. Frhr von der Goltz, *Landwirthschaft*, Thell I, §§ 47, 48, in Schönberr's *Handbuch der Politischen Oekonomie* (2d ed. 1886).—V. Berte, *Études sur le crédit agricole et le crédit foncier en France et à l'étranger* (1877) and J. B. Jusseau, *Traité du crédit foncier* (3d ed. 1885).—Tine vii., ch. 2, *Institutione del credit foncier dans les divers États Européens*.] J. K. L.

BANKS, POPULAR (GERMANY). Banks on a co-operative principle, known as "Popular Banks" in England, have been established in several countries in Europe, the most prominent examples being in Germany and Italy. The popular banks of Germany, which owe their initiative to the indefatigable efforts of M. SCHULZE-DELITZSCH, commenced operations in the years 1858-59. The principle on which these banks are founded is strictly co-operative. No advance can be made to any one except to a member. Each bank is directed by an administrative council consisting of nine members, elected at the general meeting; a committee is also elected, which manages the detail. No one is admitted as a member unless he is accepted by the administrative council; the members have to pay an entrance fee, and to subscribe a certain share of the capital, no one being allowed to exceed a fixed maximum limit. The payments may be either by monthly instalments or in one sum. Each member has the right, as soon as elected, to ask for a loan, the shortest period for advances being a fortnight, the longest three months. This may be renewed, but not for more than nine months. Every member is required, before a loan can be granted him, to have 60 per cent at least of the amount paid in to his credit, or to be guaranteed by another member of the society. The banks receive amounts on deposit, on which interest averaging about $4\frac{1}{2}$ per cent is paid; for these sums both the capital and the members individually are liable. The dividends to the shareholders average from 6 to 7 per cent. The advances are made at about 8 per cent, but a part of this is returned to the borrower by way of dividend.

These banks take, to a certain extent, the place of savings banks, and have been of great service in promoting the prosperity of those districts in which they carry on operations. Besides the popular banks (*Vorschussvereine*), Herr Schulze-Delitzsch established industrial syndicates (*Genossenschaften in einzelnen Gewerbszweigen*); co-operative societies for articles of consumption (*Konsumvereine*); building societies (*Baugenossenschaften*).

Their numbers were as follows, 1881—

Popular Banks	1889
Industrial Syndicates	898
Co-operative Societies	660
Building Societies	34
Total number of Societies	<u>3481</u>

The Capital of these Societies was—

	1881
	Converting
	the mark
	as 20 = £1
Payments of members, and reserves	£9,500,000
Borrowed Capital	21,000,000
Total	<u>£30,500,000</u>

The following figures show the development of the Popular Banks, and their position 1859-1889.

Year.	Number of Banks which reported to the central officer.	Number of Members.	Advances made.	Funds belonging to the members, capitals, and reserves.
1859	80	18,676	£ 6,100,000	£ 41,000
1882	905	461,153	75,000,000	6,073,000
1887	886	456,276	80,000,000	6,744,000

[Marks converted as 20 = £1.]

The troubles which the revolution of 1848 brought on Germany gave the impulse to M. Schulze-Delitzsch which led him to devote his attention to this great work. He perceived, with the intuition of a statesman and of a first-rate financier, that state help and charity would never aid those who sought assistance of this description to make their way out of the grinding poverty, the lot of too many, not only of the working-classes, but of the small traders. Believing that "man has implanted in his nature, together with the wants which are bound up with his existence, the powers also, the right use of which leads to the satisfaction of those wants," he steadily persevered in his efforts to apply the principle of "self-help," to a business usually supposed to require a large fund of capital before it can be set satisfactorily to work. The rate of interest to the poor but hardworking borrower was reduced from a most usurious rate (60 per cent and even 730 per cent are mentioned as rates which had been given previously), while the lender received enough to make the effort of saving worth his while. It should be added that through careful management the losses on advances have been extremely small.

[See Paper on "People's Banks," by A. Egmont Hake, *Journal of the Institute of Bankers*, June 1889; who remarks on the opposition the system received at first from the police—an opposition which, if persevered in, must have caused the whole movement, so useful to the country, to collapse. *Vorschuss- und -Credit-Vereine als Volksbanken Praktische Anweisung zu deren Einrichtung und Gründung von Schulze-Delitzsch*, Leipzig, 5th ed., 1876. This volume contains complete information on the method of establishing the system, duties of directors, officials, arrangements for general meetings, amount of shares, etc., the act of 1868, with other documents, forms of account, etc. The pains taken with the detail, and the high standard of public spirit incidentally shown, are beyond praise.

A reference in the *Banker's Magazine*, October 1889, shows that a "People's Bank of Scotland" has been proposed; no further information has, however, been received.]

BANKS, POPULAR (ITALY). Co-operative banking was introduced into Italy by Signor Luigi Luzzatti, now (February 1891) Minister of the Italian Treasury, and "Presidente dell'Associazione fra le Banche Popolari Italiane,"

who, in 1864, adapted the method of organisation employed by SCHULZE-DELITZSCH for the use of his own country. The leading principle of the Italian popular banks, as of those of Germany, is that of co-operation, of mutual responsibility, and self-help. The system has now extended itself over nearly the whole of Italy. In 1887 the number of popular banks was 608. The method of organisation is, in the main, similar to that employed in Germany. The management rests entirely on the intelligence of the shareholders themselves, working through different committees which undertake separate portions of the administration. These officers—the president and committee men—are unpaid. To prevent undue power from being accumulated in the hands of any individual, the number of shares any single person may hold is limited; and at the general meetings of the society, no shareholder has more than one vote, whatever the number of his shares may be. The advantages obtainable from joining these institutions are greatly appreciated by the smaller shopkeepers and traders, who form the largest class among the shareholders; next in number are the small agricultural proprietors and farmers, working men proper being about 10 per cent of the whole. The transactions appear to be extremely minute, loans even of 1 franc (10d.) not being unknown; the largest number of loans being for sums less than 20 frs. (16s. 8d.) The deposits correspond, the largest number being below 50 frs. (£2). Before these banks had been introduced a most usurious rate had been charged for small advances to petty traders and artisans, 30 to even 60 per cent being paid, and even higher rates. The local business done in these small advances appears to have been generally sound. L. Luzzatti quotes, with a very justifiable satisfaction, the following figures of the total advances, and the amounts overdue and unpaid in his official publication of 1889.

Popular Banks of Italy.

Year.	Amount of Loans and Discounts.	Amounts overdue and unpaid.	Proportion per cent.
1880	£16,895,236	£47,940	·28
1881	20,632,560	68,121	·33
1882	24,390,725	64,788	·26
1886	45,902,837	104,278	·22

Though the individual amounts are small, the aggregate is considerable. The recent progress has been as follows:—

Year.	Number of Banks.	Capital.	Deposits.	Total.
1883	250	£2,566,880	£10,421,200	£12,988,080
1887	608	4,164,360	17,104,680	21,269,040

The franc converted as 25 = £1.

The number of shareholders is given as 318,979 in 1887, for 541 of the banks referred to above.

The practicability of the whole system turns on the fact that the management is local, hence the characters of all concerned, whether borrowers or other shareholders, are well known, and “as each shareholder mutually guarantees his fellow, every one has an interest in preventing the bank from being defrauded” (*Quarterly Review*, January 1887, p. 154).

BANKS, SAVINGS. Institutions to encourage savings amongst the poorer classes. Probably the earliest instance of a savings bank established in this country was the Charitable Bank at Tottenham, founded by Miss Priscilla Wakefield in 1804. Six gentlemen acted as trustees, and undertook to receive the moneys deposited, allowing 5 per cent interest on all sums of twenty shillings in their hands for one year. This involved loss to the trustees, and in 1808 a similar society, opened at Bath for the advantage of domestic servants, allowed 4 per cent. The Parish Bank Friendly Society of Ruthwell, started 1810, was a genuine savings bank efficiently organised. Its success being considerable, it soon had many imitators. Six years later there were nearly eighty savings banks established in England and Ireland, and in the year 1817 legislation was resorted to. Acts 57 Geo. III. c. 105 and c. 130 were passed to encourage and regulate banks for savings in England and Ireland. Trustees were prohibited from making any profit out of these banks. At the same time they were bound to remit all deposits when they exceeded £50 in the aggregate to the office for the reduction of the national debt, where “the fund for the banks of savings” was opened, and interest was allowed by that office of 3d. per cent per diem, or £4:11:3 per cent per annum, whereas the banks themselves mostly allowed their depositors 4 per cent. There were also restrictions as to the amount which could be deposited in any one year to £50, though in England a depositor was permitted to deposit £100 in the first year. In 1824 another act was passed limiting deposits to £50 in the first year and to £30 in any subsequent year, and when the deposits of any person exceeded £200 no interest was allowed on the excess. In 1828 Act 9 Geo. IV. c. 92 was passed to consolidate and amend the laws relating to savings banks, and this provided that the rules and regulations of each such bank

should be approved by the commissioners for the reduction of the national debt; that the interest allowed by that office should be only 2½d. per cent per diem (£3:16:0½ per cent per annum); that only 2½d. should be allowed by such banks to depositors (say £3:8:5½ per cent per annum); and that no depositor should be permitted to deposit more than £150, although the interest might be permitted to accumulate until the deposit reached £200. There were (20th November 1833) amongst 385 savings banks, 414,014 depositors in England, their total deposits being £13,973,243; in Wales there were 23 banks, 11,269 depositors, and £361,150 deposits; and in Ireland 76 banks, 49,872 depositors, and £1,380,718 deposits; making in all 484 banks, 475,155 depositors, and £15,715,111 deposits. A further act was passed in 1833 (3 Will. IV. c. 14).

In 1835 Act 5 & 6 Will. IV. c. 57 was passed, extending the provisions of these acts to Scotland, and military or regimental savings banks were established in 1843. In 1844 another act was passed (7 & 8 Vict. c. 83), reducing the interest allowed by the national debt commissioners to 3¼ per cent, and the maximum interest to depositors to £3:0:10 per cent. The recent reduction in the rate of interest paid on consols must lead to further modifications in this. Arrangements were also made for the summary distribution of deposits of deceased persons, and other regulations were made in regard to the purchase of annuities, &c. On 20th November 1844 there were 577 savings banks in the United Kingdom, their deposits being £29,504,861 by 1,012,047 persons, averaging £29 per head. It may be gathered from the successive reductions in the rate of interest allowed by the commissioners that the government had not found the custody of the savings banks' funds directly profitable. In fact, as they had to invest the money in consols and other home government stocks, there was found to be an accumulated loss of some millions. Various partial provisions were from time to time made to cover this; so late, however, as 1881 there was a deficiency of £2,144,562, which was finally extinguished by the creation of an annuity of £83,673, expiring in 1908. In the year previous (1880) the interest allowed by the commissioners was lowered from 3¼ to 3 per cent, at which it now remains, while the interest to depositors is mostly 2½ per cent per annum.

But in 1861 a great development of the savings banks principle was effected. Post office savings banks (promoted greatly by the efforts of the late Sir C. W. Sikes of Huddersfield) were established by Act 24 Vict. c. 18, and at once became popular in England and Ireland. The post office savings banks, however, have been less progressive in Scotland, where, though the trustee banks were of later

creation, they have taken a firm hold. The rate of interest provided under this act was 2½ per cent.

It is evident that since the establishment of the post office savings banks throughout the kingdom the security they can offer has greatly influenced depositors, especially as the advantage to be gained in a higher rate of interest by depositing in the trustee savings banks is but small. The following figures will show the growth of these deposits:—

Savings Banks.	United Kingdom.
1833—Trustees	£15,715,111
1844	29,504,861
1860	41,258,398
1870 { Trustees	37,958,549
Post Office	15,099,104
1880 { Trustees	43,976,447
Post Office	33,744,637
1890 { Trustees	43,650,000
Post Office	67,634,000
1900 { Trustees	50,622,000
Post Office	131,916,000
1901 { Trustees	51,224,000
Post Office	137,738,000

The purchase of government stock through the post office dates from 22nd November 1880. The amounts remaining to the credit of stockholders at the end of each year were, 1880 about £128,000; 1899, £8,400,000.

In British colonies the savings banks have also become a considerable power both in the form of general and post office banks. In Australia in 1899-1900 nearly 25 per cent of the population were depositors, their deposits, aggregating £34,000,000, reaching £30:11:9 per head. The interest allowed being (1897) 3 per cent up to £200, and 2½ per cent on sums from £200 to £500. In Canada, on 30th June 1888 the deposits in the savings banks of the dominion reached \$41,371,058 (say £8,481,066). The total amount, 1895, in all the savings banks was \$57,500,000 (£11,500,000), \$11.11 (£2:4:6) per head of population.

In many foreign countries also savings banks are well established, and large sums are deposited in them. In France the rate of interest has lately been reduced from 4 to 3¼ per cent by the Caisse des Dépôts et Consignations, which is stated in the *Nouveau Dictionnaire d'Économie Politique*, p. 924, article Caisses d'Épargne, to have received in fifty years (1837-1887) about £224,000,000 from the Caisses d'Épargne, to have repaid £96,000,000, and to have invested about £20,500,000 in the purchase of government *Rente*. The *Caisse Nationale d'Épargne*, established 1881, is further stated in the same work, p. 926, to have collected during the first seven years it had been in operation about £12,000,000 belonging to more than 1,167,000 depositors. The French Savings Banks (*Bulletin de Statistique et de Législation Comparée*), to give another example of thrift in France, held £170,000,000, 31st December 1897.

BANK NOTE. REGULATIONS IN DIFFERENT

COUNTRIES. The arrangements respecting bank note circulation are very different in different countries.

(1) In the United Kingdom the note circulation is regulated by the Bank Acts of 1844-45. Sir R. PEEL, in conformity "with the principles of the currency theory" (see Tooke's *History of Prices*, vol. iv. pp. 373, 374), stated, in his speech in the House of Commons, 24th June 1844, that one of the objects he had in view was "that the paper circulation should conform itself to gold, that it should fluctuate like gold." To attain this the accounts of the Bank of England were henceforth to be divided into two parts, issue and banking departments.

The method adopted is shown in the return which follows:—

THE BANK OF ENGLAND.

An account pursuant to the Act 7 & 8 Vict. c. 32, for the week ending on Wednesday, May 2, 1901:

Issue Department.			
Notes Issued	£51,256,845	Government Debt . . .	£11,015,100
		Other Securities	6,759,900
		Gold Coin and Bullion	33,481,845
	£51,256,845		£51,256,845
Banking Department.			
Proprietors' Capital . .	£14,553,000	Government Securities	£13,757,471
Reserve . . .	3,170,208	Other Securities	30,769,179
Public Deposits ¹	9,835,641	Notes	21,510,185
Other Deposits	40,258,223	Gold and Silver Coin . . .	1,957,974
Seven-day and other Bills	177,737		
	£67,994,809		£67,994,809

May 2, 1901.

H. G. BOWEN,
Chief Cashier.

The banking department of the Bank of England, though as entirely separated from the note circulation as if it were under different management, yet is most intimately connected with it in one sense, for the amount of notes held in the banking department represents the available reserve of gold. The Issue Department is concerned with the note issue, which after 1844 was separated from the other business of the Bank, and rigidly controlled so far as the amount of notes allowed to be issued is limited by the influx and outflow of bullion. The Bank of England, while allowed to issue part of its note circulation against securities, either government or of an analogous description of a fixed character (£14,000,000, 1844; £17,775,000, 1901), was compelled to hold bullion, a fourth of the whole permissibly in silver, against the remainder. The circulation of notes was thus automatically linked to the supply of bullion, and since the Bank has ceased to hold silver bullion since 1853, to

the supply of gold bullion brought to it. "The action of the public (said Sir R. Peel, 6th May 1844) will regulate the amount of that portion of the note circulation which is issued upon bullion." This arrangement has since been carried out. The limit to the note circulation of the Bank of England is thus the amount of bullion it may hold. Three times since 1844—in 1847, 1857, and 1866—circumstances have compelled a relaxation of the Bank Act, but in 1847 and in 1866 the note circulation did not exceed the ordinary legal limit allowed. In 1857 an addition of £2,000,000 was made to the "other securities" held in the issue Department by authority of a letter addressed by the First Lord of the Treasury (Lord Palmerston) and the Chancellor of the Exchequer (Sir G. C. LEWIS) to the Governors of the Bank, dated 12th November 1857. Under the relaxation of the act thus permitted, the note circulation exceeded the statutory limit by £928,000 on the 20th November 1857 (*Proceedings of the Select Committee on the Bank Acts*, House of Commons, 1858, p. xli). In 1847 and 1866, though permission was given, the letter of the act was not actually infringed. To continue the history of the act of 1844: the existing issuing banks in England and Wales were allowed to continue their issues, under conditions intended to bring about the gradual extinction of their note circulations, no security whatever being required to be held against their issues. To the note-issuing banks in Scotland and Ireland more favourable terms were allowed, but under condition that for every £1 in paper issued beyond the limit fixed by the acts of 1845, £1 in gold should be held, not as security, but as representing the addition to the currency circulating in the country.

(2) In France an entirely different system prevails. A limit is fixed to the note circulation of the Bank of France (£96,000,000, raised to £112,000,000, 1871; to £128,000,000, 1872; to £160,000,000, 1893); but provided these limits are not exceeded, the bank is not compelled by law to hold any special proportion of bullion whatever. The bullion held is very large in amount, thus it was, 31st Dec. 1900, £93,000,000 gold, £44,000,000 silver; the average note circulation (1900) £161,000,000.

(3) In Germany a modification, with very essential differences, of Peel's act is in force. The German Bank Act of 1875 allows an amount of issue against securities (£12,500,000, 1875; £22,500,000, 1899). Against the remainder cash defined as follows is to be held:—"current German money, Reichskassenscheine (legal tender notes of the empire), notes of other German banks, and gold bars and foreign gold coin calculated at the rate of 1392 marks (say £69 : 12s.) for a pound weight (German) of gold." Further, the Imperial Bank is obliged "to have in its coffers at least one-third of the

¹ Including Exchequer, Savings Banks, Commissioners of National Debt, and Dividend Accounts.

amount of notes in circulation, in German currency, as defined above. "The rest of the amount of notes in circulation must be represented by discounted bills, due at latest in three months, and for which generally three, but at least two persons known to be solvent are responsible." Should the note issue exceed the limits assigned, a tax of 5 per cent on the excess issue is charged (see "The German Bank Act of 1875," R. H. Inglis Palgrave, *Journal of the Institute of Bankers*, vol. vii. 1886). The note circulation exceeded the statutory limit on twenty occasions in the year 1900.

(4) In the United States the note circulation of the national banks, which provides a large part of the circulating medium of the country, is arranged on different principles from those existing in any of the countries previously mentioned. For a fuller description of this system see BANK NOTE (United States of America). By way of comparison with the arrangements respecting bank note circulation in other countries it is sufficient to state here that bonds of the United States are required to be deposited against the note circulation which was not originally allowed to exceed 90 per cent of the full value of the bonds, but was permitted up to the amount of the capital stock of the banks. The proportion to the bonds was afterwards diminished to 80 per cent, raised to 90 per cent (1898), with a possible maximum of 90 per cent of each bank's capital. The redemption of all the notes presented at the place of business of the bank is required by law during business hours, in "lawful money of the United States," towards which a reserve of 5 per cent in lawful money on the extent of the note circulation is required to be constantly kept on deposit with the treasurer of the United States. The triple safeguard thus provided, (1) by the security of government bonds being 10 per cent in excess of the circulation;—(2) that the circulation is limited to 90 per cent of the paid-up capital;—(3) that a reserve of 5 per cent on the circulation in lawful money should always be forthcoming,—has furnished the United States with a system of note circulation which for many years after the establishment of the national banks "was its most important feature:" (Report of the Comptroller of the Currency, 1888). Its decrease was partly attributable to the heavy taxation imposed on it, partly to the diminishing return obtainable from the bonds on which it was founded, partly also to the movement of business which economises circulation as banking facilities extend. It has increased greatly, 1899 (see BANK NOTE, United States of America).

(5) In Sweden the notes of the "Enskilda Banks" are protected by provisions which, while permitting the use of securities more in correspondence with those allowed by the Bank of Germany, provide, practically, for the redemption of the circulation in an effectual manner.

The instances given are examples of the different methods on which circulation may be based. In the case of the Bank of England it is assumed that a certain proportion of the total issue cannot be presented for payment in specie; fixed securities are held against that part, while bullion has to be held against the remainder. The two departments, note circulation and banking, are entirely separate from each other. The Bank of France is allowed greater freedom within the limit as to maximum issue prescribed by the law. The Bank of Germany, with a fixed proportion allowed to be issued against securities, is compelled to hold good commercial bills against the remainder, these securities "turning themselves into money," in business phrase, at fixed and not remote dates. The national banks of the United States possess a circulation as rigidly secured as that of the Bank of England against bonds of the Government, but applicable, through the working of local banks, to the wants of each district. A maximum limit is fixed.

There are two schools of opinion with respect to a bank note issue. The first, headed by A. SMITH and RICARDO, holds "that immediate convertibility into coin is all that is requisite to prevent the excessive issue of paper" (speech of Sir R. Peel, 6th May 1844); the second, led by PEEL himself, assumes that unless issuers of notes "vigilantly observe the causes which influence the influx or efflux of coin, and regulate their issues of paper accordingly, there is danger that the value of the paper will not correspond with the value of coin." Hence the principle of Peel's measure "was to make the currency, consisting of a certain proportion of paper and gold, fluctuate precisely as if the currency were entirely metallic" (speech 13th June 1844, of Mr. Goulburn, who was chancellor of the exchequer in the administration of Sir R. Peel). It will be observed that neither in the case of the Bank of France nor of the Bank of Germany nor of the national banks of the United States is this rule enjoined. It is enforced as to the extra note issue of the Scotch and Irish banks (Bank Acts of 1844-45), but in their case the coin compulsorily held is not security for the circulation (see BULLION COMMITTEE, REPORT OF; CIRCULATING MEDIUM; CONVERTIBILITY OF BANK NOTES; CURRENCY DOCTRINE).

BANK NOTE (UNITED STATES OF AMERICA).—In the United States the note circulation of the national banks, which alone are authorised to issue bank notes, is regulated in the main by the provisions of the act of 1863, bearing the significant title, "An Act to provide a national currency, secured by a pledge of United States bonds, and to provide for the circulation and redemption thereof." All notes issued must be secured by United States bonds deposited in the treasury, the notes being limited to ninety per

cent of the market value, not exceeding ninety per cent of the par value, of the bonds deposited, and no bank being allowed an issue exceeding its capital. The aggregate circulation of all the banks was also limited originally to \$300,000,000 (£60,000,000); and in 1870 this limit was raised to \$354,000,000 (£70,800,000); but all limit upon the aggregate was removed in 1875, by the act for resuming specie payments. The notes must be redeemed by the issuing bank in "lawful money" (specie or legal tender notes) upon presentation, and since 1874 are also redeemable at the treasury, every bank being required to maintain a reserve of lawful money, amounting to five per cent of its circulation, in the hands of the treasurer of the United States. The notes are not a legal tender between individuals, but are by law received and paid out by the government in all payments except for custom duties and interest on the public debt; and every national bank is required to receive in payments the notes of any other. The ample margin of security afforded by the deposit of bonds, the systematic redemption at the treasury, and the ability to use any note in any part of the union where a national bank is to be found, have given the notes complete credit and an entirely unimpeded circulation, which made the system for many years "important to the banks, still more important to the public." At the close of 1873 the bank circulation stood at \$341,320,256 (£68,264,051), nearly reaching the maximum allowed by law. It fell, however, during the long commercial depression which followed, and of late years has declined rapidly, owing to the diminished return now obtained from an investment in bonds, and to the tax of one per cent on circulation imposed by the national government. At the resumption of specie payments in 1879, after the limit to the aggregate circulation had been removed, the bank notes outstanding were \$303,500,000 (£60,700,000); January 1885 they had fallen to \$280,000,000 (£56,000,000); and in May 1890 to \$125,900,000 (£25,180,000). This discouragement of note circulation is of little importance to city banks, but is a serious matter for those in the country.

C. F. D.

(The circulation of the National Banks had, however, increased to \$243,066,624 (£48,600,000) on 31st October 1899.)

BANKRUPTCY IN SCOTLAND. In early days the insolvent debtor in Scotland was treated practically as a criminal and was subject to the penalties of rebellion against a command from the crown enjoining him to pay his creditor. From the Roman law there was, however, borrowed, a process of relief—the *cessio bonorum*—under which he gave up all his property and thus secured liberation and immunity from imprisonment on the ground of his debt, but was not discharged. Consequently

it was precarious for him to try to resume business, and the tendency was for him to conceal some property before creditors could take steps against him. In 1621 an act of the Scots parliament was passed directed against gratuitous alienations to "conjunct or confident persons" on the eve of insolvency. In 1696 another act checked the giving one creditor any unjust preference over others; and it did so by providing, in substance, that where a person became notoriously insolvent or "notour bankrupt"—the evidence of which was to be that proceedings had been taken against him for debt, and that in consequence he had been imprisoned (or, afterwards, something legally equivalent), or had absconded or resisted arrest or retired into sanctuary—all unjust preferences granted by him within sixty days prior to the notour bankruptcy were to be annulled. It is here to be observed that the effect of the notour "bankruptcy" was not to bring about a distribution of his estate; it only limited his status; he might still continue in business, but thenceforth—and indeed at common law from the moment of actual insolvency—he must act as steward (or rather *negotiorum gestor*) for the whole of his creditors and he must use his best endeavour to treat them equally. But the creditors might be impatient; they might press their individual claims, and all the more so since the law still allowed certain privileges to the creditor first in the race for "diligence" or execution; whence too often ensued the ruin of the debtor, to the actual disadvantage of the general body of creditors. In all this every creditor fought for his own hand; the debtor must, so far as he could, treat them all equally; but the law did not provide any means of putting all the creditors on an equal footing until 1772, when the first Sequestration Act was passed, to endure experimentally for ten years. Sequestration at common law (French *mission en séquestre*) was a well-known proceeding in Scotland, analogous to appointing a receiver on an estate in chancery; a judicial factor was appointed by the Court of Session who managed an estate for the benefit of those interested until it was judicially ascertained who were the parties entitled, or until the occasion for taking the estate out of the hands of the administrator had passed over. On this analogy, the personality (but curiously not the reality, for it was abhorrent to the ideas of the conveyancers of the time that realty should pass without feudal conveyances) became vested either in a judicial factor proposed by the creditors, or else, alternatively, in a trustee to be appointed by the creditors as if under a voluntary settlement. The judicial factor distributed the estate under the direction of the court; the trustee did so extra-judicially. In 1783 the experiment was felt, especially on the trustee system, to have been a success; a new experimental act was

passed in which SEQUESTRATION was confined to the estates of merchants and manufacturers, the whole estate, real as well as personal, became subject to division, the trustee reported to and acted under the control of the Court of Session, and those creditors who had acquired preferences by taking proceedings against the bankrupt within a certain time before the sequestration were put on an equal footing. By successive statutes this act was renewed with improvements; a permanent act was passed in 1839, which introduced the sequestration of the estates of deceased debtors; and the present leading statute is one of the year 1856 (19 & 20 Vict. c. 79) in which the same guiding principles are applied in detail, with these outstanding alterations, that sequestration is not confined to persons in trade, and that the procedure may be (and in practice is) carried through before the sheriff courts; while the Court of Session retains control of the whole bankruptcy administration after sequestration has been granted, through an officer of court called the Accountant in Bankruptcy,—now the Accountant of Court,—whose diligent supervision of the reports and accounts of trustees has been the key-stone of the Scottish system.

Sequestration proceedings are initiated either by a petition by the insolvent himself with concurrence of creditors to a certain amount, or by creditors to the same amount alleging notour bankruptcy and Scottish jurisdiction. On special application, or for special reasons, the court may appoint an interim judicial factor, or may in any case seal books, close premises, and keep the key until a trustee is elected and confirmed. Sequestration may be opposed by the debtor himself, or by any creditor who has a special interest; and it may be recalled on producing before the Court of Session a private deed of arrangement agreed to by a majority of the creditors in number and four-fifths in value (rare in practice) or by showing the Court of Session within three months that the bankruptcy procedure ought to be carried through in England or Ireland.

Suppose the court grants sequestration; a meeting of creditors is appointed, six to twelve days ahead, which is advertised in the *Edinburgh Gazette*. At that meeting the creditors elect a trustee (or trustees in succession), who must not be the bankrupt or any relative or confidential friend of his, or any creature of such, or one whose interests are opposed to those of the general body of creditors; otherwise, the court will not interfere with the creditors' choice. The sheriff presides at this meeting if two creditors call upon him to attend. Voting power in the election is according to amount of unsecured debt. The sheriff decides within four days whether any candidate for trusteeship is ineligible, and confirms the appointment of the trustee on his finding security either for his

whole dealings or for a sum limited by the creditors at their first meeting. The trustee at once reports himself to the accountant in bankruptcy. The trustee is assisted or supervised by three "commissioners"—a committee of inspection chosen at the first meeting of creditors; they concur with him in compromises and references to arbitration, they declare the dividends, and they may report independently to the creditors.

The trustee cannot resign, but may be removed without cause assigned by a majority of creditors. His first duty is to make up an inventory and valuation of the whole estate and to send that to the accountant. The bankrupt is bound to afford him every assistance in preparing this; if he does not, or if he obstructs the administration by refusing to execute any necessary deed, he may be imprisoned; but he is paid for his assistance. After confirmation the trustee applies to the sheriff to fix a day for public examination of the bankrupt; at that examination the bankrupt may, if need be, be committed to prison till he shall make full and satisfactory answers to the questions put; and his relatives and friends (wife, etc.) may be brought before the sheriff and examined as to disposal of property.

The bankrupt may be discharged (1) on acceptance of a composition by his creditors (four-fifths in value on a first offer, or nine-tenths in value on a subsequent offer) at their first or second meeting being reported to the court; or (2) without composition if the creditors are unanimous, or if a majority in number and four-fifths in value concur after six months or a majority in number and value after eighteen months or without any consent after two years; but in no case can he get discharge without showing the court, either that he has paid or secured to the creditors a dividend of 5s. in the £, or that his not having done so was owing to circumstances for which he could not justly be held responsible; and discharge may be withheld for misconduct on his part.

Cessio bonorum has recently (1880 and 1881) been so far assimilated to sequestration that it is now in substance merely a cheaper form of procedure for small estates. The trustee is appointed by the sheriff; and there are no commissioners, but proof of debts takes place, and discharge is granted or withheld as in sequestration.

The principal changes in the law since 1856 have been directed towards enabling discharge to be withheld for misconduct (1860), towards extending the preference of clerks and workmen (1875), towards the abolition of imprisonment for debt (1880 and 1882), towards the amendment of procedure in *cessio* (1880), and granting discharge in *cessio* (1881), towards dealing with fraudulent debtors and those who fail to keep accounts (1881), and towards rendering

undischarged bankrupts incapable of holding certain offices of trust and bringing them under the criminal law if they take credit for more than £20 without disclosing their condition (1884).

With regard to liquidation by private arrangement: the method is—(1) Conveyance by debtor to trustee (“trust-deed for behoof of creditors”); (2) mutual contract by all the creditors to act in common according to definite scheme (“deed of accession”). The main point of weakness in this is the inadequacy of means to keep the trustee up to his duty; the contract should provide machinery for this. If this be done the method is regarded with favour. Extrajudicial composition contracts between insolvent debtors and their creditors are also not uncommon in practice.

[*Bell's Commentaries on the Law of Scotland*, 1870.—*Mr. Henry Goudy's Law of Bankruptcy in Scotland*, 1886.]

A. D.

BANKRUPTCY LAW AND ADMINISTRATION (ENGLAND). A good bankruptcy law must aim at the attainment of three distinct and sometimes conflicting objects; first, the speedy and economical distribution of the debtor's property amongst his creditors; secondly, the release of the debtor from his load of debt, so far as this may be justified by his conduct; and thirdly, the punishment of fraud, reckless trading, and personal extravagance. The policy of the bankruptcy laws has varied considerably. Sometimes one, sometimes another of the above-mentioned objects has been the guiding principle of the enactment, and various machineries have been devised for giving effect to them. During the present century some forty-six acts relating to bankruptcy have been passed. Roughly, their effect may be described as follows: Before 1831 the full control of the administration of bankrupt estates was in the hands of the creditors, the result being wholesale mismanagement and general dissatisfaction. In 1831 an act, known as Lord Brougham's Act, introduced a system of official administration. Official assignees were appointed to the London Bankruptcy Court, but not in the country districts. After some years' trial of the system of official assignees in London, and after a favourable report from a royal commission, the system was extended in 1842 to the country generally. The official assignees were again favourably reported on by Select Committees in 1847 and 1849. In 1861 opinion had begun to turn against them, and an act was passed considerably limiting their functions. In 1864 a select committee, on what seems inconclusive evidence, wholly condemned the system of official assignees. These officers were abolished by the act of 1869, and once more a system of voluntarism was inaugurated, with the wonted result. Creditors were supine, and estates were wrecked and plundered by the

rapacity of the lower class of trustees. Every facility was offered to fraudulent debtors, and they were not slow to avail themselves of their opportunities. A few years' trial of the act resulted in its general condemnation, but it was not till 1883 that any legislative change was effected. In that year Mr. Chamberlain, then president of the Board of Trade, succeeded in carrying the act which introduced the system now in operation. The Bankruptcy Act 1883 (46 & 47 Vict. c. 52), which is amended in some details by the act of 1890 (53 & 54 Vict. c. 71), makes a fresh departure in bankruptcy legislation. In the first place it severs judicial from administrative functions. Judicial functions are necessarily left to the courts, but administrative supervision and control are intrusted to an executive department of the state, namely the BOARD OF TRADE. Creditors still retain the general control over the debtor's estate, but his conduct is subject to an independent investigation with a view to his punishment if his insolvency has been caused by culpable recklessness or fraud. Trustees are subjected to the supervision of the Board of Trade, who require security from them, audit their accounts, and exercise a general superintendence over their dealings. The act of 1869 proceeded on the theory that the debtor and his creditors were the only parties concerned in a bankruptcy. The present measure recognises the principle that bankruptcy is a matter of public concern affecting the community at large. Speaking broadly, the act establishes one entrance into, and two exits from, the state of statutory insolvency. The receiving order, as it is called, is the entrance gate. By the receiving order the debtor's property is put under the charge of an official of the Board of Trade, until the creditors, with the leave of the court, have determined whether the debtor shall be allowed to terminate his insolvency by a composition or scheme of arrangement, or whether he shall be adjudicated a bankrupt and his affairs be wound up in bankruptcy proper. In either case there is a turnstile through which the debtor must pass, namely, the public examination at which his conduct and financial dealings are investigated in open court.

The courts which exercise bankruptcy jurisdiction are the High Court and the county courts. For bankruptcy purposes England and Wales have been mapped out into 135 districts. The bankruptcy business of the London district is allocated to the High Court, while in the country districts the county courts are the courts of original jurisdiction. To secure uniformity of practice, one of the High Court judges is specially appointed by the lord chancellor to take bankruptcy business, and it is provided that he shall always be a member of the divisional court to which bankruptcy appeals from the county courts are brought.

The bankruptcy department of the Board of Trade consists first of local officers called official receivers, and secondly of a central staff under the inspector-general, who audit trustees' accounts, and supervise the conduct and dealings both of trustees and of the local officers. Each bankruptcy district has its official receiver, but the same officer may be appointed official receiver for two or more districts, or on the other hand, two or more receivers may be appointed to one district according to local requirements. An OFFICIAL RECEIVER, besides being an officer of the Board of Trade, is made an officer of the court, having jurisdiction over his district. The object of the latter provision is to give him free access to court documents, and to enable him to consult the judge without the formality of a motion in open court. His reports are made *prima facie* evidence of the matters contained in them. His duties are declared by the act to "have relation both to the conduct of the debtor and the administration of his estate" (§ 68). As regards the debtor, it is the duty of the official receiver to investigate his conduct and to report to the court thereon, to take such part as the Board of Trade may direct in his public examination, and also to assist when requisite in his prosecution. As regards the estate, it is the official receiver's duty to act as interim receiver pending the appointment of a trustee, and as manager when a special manager is not appointed; to summon and preside at the first meeting of the creditors, to issue proxies, to report to the creditors on any proposal by the debtor for a scheme or composition, to advertise the proceedings, and to act as trustee during any vacancy in that office. In cases where the estate does not exceed £300, the official receiver becomes the trustee unless the creditors expressly supersede him. In short, this office is made the keystone of the present system, and the success or failure of the act must mainly depend on the efficiency or non-efficiency of the official receivers.

Bankruptcy proceedings may be commenced either by the debtor himself or by a creditor whose debt amounts at least to £50. If the petition is presented by a creditor it must be founded on one of the overt acts of insolvency, called acts of bankruptcy, which are specified in § 4. To prevent an influx of paupers a £5 stamp is charged on bankruptcy petitions, and a deposit of £5 is also required to cover preliminary expenses. The first result of a bankruptcy petition, properly substantiated, is the making of a receiving order by the court. This order does not divest the debtor of his property, but puts the official receiver in charge of his property, and stays proceedings by unsecured creditors. As soon as the receiving order is made the debtor is bound to give the official receiver full information as to his affairs and

failure, and to make out a formal statement of his assets and liabilities for submission to the first meeting of creditors. The first meeting should be held within fourteen days of the receiving order. Proxies must be on an official form. A creditor can only give a general proxy to a person in his regular employment or holding a general power of attorney from him, or to the official receiver. At the first meeting the debtor may propose to his creditors that his insolvency should be terminated by a composition or scheme, thereby avoiding the disabilities of bankruptcy proper (§ 3 of act of 1890). If this proposal be not assented to, the debtor must be adjudged bankrupt. If it be assented to, the assent is provisional. The debtor must still go through his public examination. At the meeting the proposal for a composition or scheme must be accepted by a majority in number representing three-fourths in value of all the creditors who have proved. When the public examination is concluded the matter then goes before the court for its approval. The court, before sanctioning the composition or scheme, hears the report of the official receiver, and has to consider whether it is calculated to benefit the general body of creditors, and also whether the debtor's conduct has been such as to justify his escape from the consequences of bankruptcy. When the composition or scheme is approved by the court it is binding on any dissentient minority of creditors, the receiving order is rescinded, and the debtor is remitted to the full control over his affairs. If, however, the provisions of the composition are not carried out, the debtor is still liable to be adjudged bankrupt. Section 23 of the act further provides that a debtor who has been adjudged bankrupt may propose a composition or scheme under the like terms and conditions as before bankruptcy. If the composition or scheme is sanctioned by the court, the adjudication of bankruptcy is annulled.

When it has been decided that a debtor's estate shall be administered in bankruptcy proper, the first business of the creditors is to elect a trustee. The trustee cannot, however, act till he has received the certificate of the Board of Trade. Before he gets his certificate he must give security for the due performance of his duties to the Board; and the Board have further the right to object to his appointment if he is an unfit person, or if his interests appear to clash with the interests of the creditors generally. In the interim the official receiver acts as trustee. As soon as a debtor is adjudged bankrupt the whole of his property vests in his trustee, and any further property which he may acquire before he gets his discharge also vests in his trustee. This rule does not apply to the debtor's personal earnings, though, if he has anything in the nature of a fixed income, the court may make an order charging a portion of

it for a specified time. It is to be noted further that the trustee's title relates back to the earliest act of bankruptcy committed by the debtor within three months of the petition, and express provision is made for avoiding fraudulent settlements and conveyances made by the debtor on the eve of his bankruptcy (§§ 47, 48). The main duty of the trustee is to realise the debtor's estate with all convenient speed, and to distribute it rateably among the creditors. The bankruptcy laws, however, recognise certain exceptions to the rule of equal distribution. Priority is given within certain limits to rates and taxes and to claims for wages or salary by workmen, servants, and clerks (§§ 40, 51 & 52 Vict. c. 62). On the other hand, certain debts are postponed; for instance, a partner is not allowed to prove against his co-partner's estate in competition with the creditors of his firm. The landlord's right to distrain for six months' rent is preserved. The rights of creditors holding security are also saved. A secured creditor may either give up his security and prove for his whole debt, or, subject to the trustee's right to redeem under certain conditions, retain his security and prove for the balance of his claim. The trustee, as a rule, exercises his functions under the guidance of a committee of inspection appointed by the creditors, but if no such committee be appointed, their duties are performed by the Board of Trade (§ 22).

As soon as a bankrupt's public examination is concluded he may apply for his discharge. Notice of this application must be given by the official receiver to every creditor who has proved. At the hearing the court receives from the official receiver a report on the debtor's conduct and the causes of his failure. The official receiver, the trustee, and any creditor who appears are entitled to be heard on the matter. If it appears that the debtor has been guilty of any conduct amounting to a misdemeanour under Part II. of the Debtor's Act 1869, the court must ordinarily refuse the discharge. The debtor then can only escape from bankruptcy and its consequent civil disqualifications (§§ 32-34) by payment of his debts in full with costs and interest (§ 36). If the debtor has not committed a misdemeanour, but has been guilty of minor misconduct, the court has a discretion either to refuse the discharge, or to suspend it or make it conditional. A common condition is to order judgment for a specified sum to be entered up against the debtor. This judgment can only be enforced by leave of the court. Section 8 of the act of 1890 specifies twelve classes of facts involving minor misconduct which prevent the court from granting an unconditional and immediate discharge; for instance, not keeping proper business books (see BOOK-KEEPING), trading with knowledge of insolvency, rash speculation, previous bank-

ruptcy, fraud, or fraudulent breach of trust, or not being able to pay 10s. in the £. Under previous acts it was found that an undischarged bankrupt frequently began to trade again and to incur fresh liabilities with no means of meeting them. To meet this evil § 31 of the present act makes it a criminal offence for an undischarged bankrupt to obtain credit to the extent of £20 or upwards from any person without informing such person that he is an undischarged bankrupt. If the debtor's financial conduct has been blameless he is entitled to an unconditional discharge. The order of discharge releases the debtor from all debts and liabilities provable in the bankruptcy, with the exception of certain crown debts and debts incurred through his personal fraud or fraudulent breach of trust, and claims arising out of seduction or divorce court proceedings.

Such, in brief outline, is the general system of bankruptcy established by the act of 1883. Special provision, however, is made by § 121 for the more summary administration of small estates when the estimated assets do not exceed £300. In such cases the official receiver acts as trustee, unless superseded by the creditors, and discharges the duties of the committee of inspection. Only one meeting is required to approve a composition or scheme, and when possible the estate is to be distributed in a single dividend, *i.e.* in a payment made to each of those concerned, at the same time. A reduced scale of costs and charges is also provided.

The act further attempts, in § 122, to deal with the case of quasi-pauper debtors whose total liabilities do not exceed £50. In such cases the county courts are empowered to make what is called an administration order, under which the debtor pays his debts, either in full or in part, by specified instalments out of his earnings. The order, though called an administration order, is really an unsecured composition arbitrarily imposed by the court upon the creditors. In 1887 a departmental committee appointed by the lord chancellor and board of trade reported that the system was a total failure, and that the only way of dealing with the matter was by a bold handling of the subject of imprisonment for debt.

The administrative working of the Bankruptcy Act is the subject of an annual report by the Board of Trade to both houses of parliament. For the law on the subject, reference may be made to the treatises of Baldwin, Chalmers and Hough, Robson, Vaughan Williams, and Yate Lee, all of which are kept approximately up to date.

M. D. C.

BANVIN, DROIT DE. An oppressive seigniorial right in France under the old *régime*. By it a certain interval, generally a month or forty days, was fixed after the vintage during which the lord's wine alone could be sold, and a

peasant had to pay large sums for leave to sell his wine before the expiration of the period.

[De Tocqueville, *France before the Revolution*, note lxxvii.]

R. L.

BARBARY COMPANY, THE. See TURKEY COMPANY.

BARBON, NICHOLAS, M.D. (1640 ?-1698), probably the son of Praisegod Barebone, was born in London, studied medicine at Leyden, graduated M.D. at Utrecht in 1661, and was admitted an honorary fellow of the College of Physicians in December 1664. After the great fire of 1666 he was instrumental in establishing the first fire insurance office in London (1681); he was one of the most considerable re-builders of the city. He was M.P. for Bramber in 1690 and 1695, founded a land bank, which was united with that of BRISCOE in 1696 and is reported to have been successful, and was among the projectors of the short-lived National Land Bank. He died in 1698, having appointed John ASGILL, the economist, to be the executor of his will, and directed that none of his debts should be paid.

Barbon's works were numerous and deserve some extended notice, as his views were, though with some failings which we shall have to notice, remarkably in advance of his time, and even approaching to modern views on value, interest, rent, and foreign trade. He published in 1684 *A Letter to a Gentleman in the Country giving an Account of the Two Insurance-Offices; the Fire-Office and Friendly Society*, setting forth the advantages of his own institution and the disadvantages of its rival. In 1685 appeared (anonymously) his *Apology for the Builder; or a Discourse showing the Cause and Effects of the Increase of Building*. He opposed the opinion then prevalent that London was growing too large, and that the building new houses there drained the inhabitants from the country. He discussed in this pamphlet the theory of "rent." Its origin he explains in the following passage: "When mankind is civilised, instructed with arts, and under good government . . . the rich are fed, clothed, and housed by the labours of other men, but the poor by their own, and the goods made by this labour are the rents of the rich men's land (for to be well fed, well clothed, and well lodged without labour either of body or mind, is the true definition of a rich man)." (Reprinted in *A Select Collection of Scarce and Valuable Economical Miscellaneous Tracts*. Reprinted for Lord Overstone, 1859, pp. 1-26 of that volume; see McCulloch, *Literature*, pp. 350, 351). In 1690 Barbon published *A Discourse of Trade*. By N.B., M.D., London. Printed by Tho. Milbourn, for the Author, 1690. In this treatise (92 pp. 12°), which hitherto has been scarcely noticed by those who have written on the history of economics, he displays as much ingenuity as any one of his greatest contemporaries. In the preface he attributes the importance which is ascribed to trade to the invention of gunpowder, foreign trade being considered necessary on account of its furnishing the supplies required by the country. But he thinks that trade

has been considered from a too narrow point of view, especially by merchants like Thos. MUN, who "apply their thoughts to particular parts of trade, wherein they are chiefly concerned in interest." The first chapter treats "of trade and the stock, or wares of trade." Trade, according to him (Barbon), consists in "the making and selling of goods for another;" its parts are handicraft trade and merchandising. Its aim is to make a bargain; in every bargain the wares to be sold, their quantity and quality, their value or price, the money or credit by which they are bought, and "the interest that relates to the time of performing the bargain" are to be considered. "The Stock and Wares of all Trade are the Animals, Vegetables, and Minerals of the whole Universe, whatsoever the Land or Sea produceth" (p. 3). They are either natural or artificial wares. Both are called staple commodities of the countries where they abound, either native or foreign. The native staple of each country consists of its actual and unexhausted riches; this shows the error of Mr. Mun, who thinks that nations can get rich by parsimony like individuals (p. 6). This native staple is the basis of foreign trade, which is an exchange of commodities (p. 7). Foreign staples, even if carried on by monopoly, are uncertain wealth; this he illustrates by the changes brought about by the possession of the East India trade. The second chapter deals with "the Quantity and Quality of Wares." The third chapter, "of the Value and Price of Wares" is one of the most remarkable in this work. "The Value of all Wares arises from their Use; Things of no Use have no Value, as the English Phrase is, *they are good for nothing*." Thus he approached more closely than any one of his contemporaries to modern views on value and price. "The Price of Wares," he says, "is the present Value; And ariseth by Computing the occasions or use for them with the Quantity to serve that Occasion; for the Value of things depending on the use of them, the *Over-plus* of Those Wares, which are more than can be used, become worth nothing; So that Plenty in respect of the occasion, makes things cheap, and Scarcity, dear" (p. 18). These elements being variable as well as the Wants of the Mind, and most things being useful through supplying the latter, "there is no fixt Price or Value of anything for the Wares of Trade" (p. 18). But, "There are two ways by which the value of things are a little guessed at; by the Price of the Merchant, and the Price of the Artificer; the Price that the Merchant sets upon his Wares is by reckoning Prime Cost, Charges, and Interest, the Artificer's Price includes the Cost of the Materials and the time of working them. The Price of the Artificer is according to the Value of the Art and his skill (p. 19). "But the Market is the best Judge of Value; for by the Concourse of Buyers and Sellers, the Quantity of Wares, and the Occasion for them, are best known" (p. 20). The next chapter, "of Money, Credit, and Interest," begins with the following definition: "Money is a Value made by a Law; and the Difference of its Value is known by the Stamp and Size of the Piece" (p. 20). It has two principal uses: "It is the Measure of Value, By which the Value of all other things are reckoned," and "It is a Change

or Pawn for the Value of all other Things. For both reasons, "the value of money must be made certain by Law." Having "its sole Value from the Law," its Metal, whether Brass (like in Spain), or Copper (Sweden), or Tin (English farthings), is not material (p. 21), "6d. in Farthings will buy the same thing as 6d. in Silver." Foreign coins, upon which their country's law has no force, go therefore by weight and are of no certain value (p. 22). The chief advantage of gold and silver money is to prevent counterfeiting, besides its other uses for plate, etc., and its easy exportation, which the example of Spain shows it is impossible to prohibit (p. 23). It has no intrinsic value, but two values; one certain, because of the law, another variable like the value of gold and silver or other metals (p. 25). It is only time and place gives a difference to the value of all things, "Nothing in itself hath a certain Value." Credit is "a Value raised by Opinion" (p. 27); Barbon distinguishes two sorts of credit, the one grounded upon the ability of the buyer, a short credit mostly; the other upon his honesty, a long one. He defends the necessity of erecting a public bank in London (pp. 28-31). Interest is, according to him, "the Rent of Stock, and is the same as the Rent of Land: the First is the Rent of the Wrought or Artificial Stock; the Latter, of the Unwrought or Natural Stock" (p. 31). Barbon notes that "Interest is commonly reckoned for Money, . . . but this is a mistake: for the Interest is paid for Stock. . . . No Man takes up Money at Interest to lay it by him, and lose the Interest by it" (pp. 31, 32). The clear exposition of this doctrine places Barbon, as an economist, above both PETTY and LOCKE, and it was not till sixty years later that Joseph MASSIE (1750) and HUME rediscovered the correct theory of interest. The uses of interest are to measure, 1st, profit and loss in trade, 2nd, the value of the rent of land; the value of the last being reckoned "by adding three years' Interest more than is in the Principle (*sic*). Therefore interest must be fixed. The praise which Barbon bestows on trade (foll. chapter "of the use and benefit of trade,") forecasts the celebrated passages on the consequences of the division of labour in the *Wealth of Nations*, especially his denying of the importance of Increasing money. "It is the Natural Stock that is the Real Value, and Rent of the Land" (p. 37). In a very interesting digression Barbon describes the civilising influence of trade, and maintains the chief causes which promote trade to be "industry in the poor and liberality in the rich" (p. 61). Against the mercantilist views of "sparing for exportation" he maintains, that "by not consuming the Goods that are provided for Man's Use, there ariseth a dead Stock, called Plenty, and the value of those Goods fall. . . . A Conspiracy of the Rich Men to be Covetous and not spend, would be as dangerous to a Trading State as a foreign War" (p. 63). Clothing and building employ a great variety of trades, and the luxury of town-life increases the revenues (p. 70). In the last chapter Barbon declares that "the Two Chief Causes of the Decay of Trade are the many Prohibitions and high Interest" (p. 71), his argument being "that the Prohibiting of any foreign Com-

modity doth hinder the Making and Exportation of so much of the Native as used to be Made and Exchanged for it. . . . The Native Stock for want of such Exportation Falls in Value, and the Rent of the Land must fall with the Value of the Stock" (p. 72). This work of Barbon's contains the ablest refutation of the theory of the balance of trade previous to Hume and Adam Smith (see BALANCE OF TRADE). Barbon refutes the common argument for prohibition that the consumption of foreign commodities hinders the production and consumption of the native; for the consumption of foreign wares arising from the wants of the mind, the setting up obstacles to it will not encourage the consumption of native wares. A general prohibition would be the ruin of all trading nations; if the rare case should occur that the use of foreign goods checked the consumption of native goods, duties may be imposed to differentiate their consumption (pp. 75-78). The rate of interest being higher in England than in Holland, is a second obstacle to trade, for through this the Dutch traders are enabled to undersell the English (pp. 78-87). Any injury to those persons who live upon the interest derived from Money would be remedied through the rise of land, the interests derived from which would be hereby better secured. "For the Land is the Fund that must support and preserve the Government; and the Taxes will be lesser and easier paid" (p. 91). Its support is the more important "because it doth not Disturb, Lessen, nor Alter the Value of any Thing else" (p. 92). The *Discourse of Trade* was attacked by an anonymous author E. H., *Reasons against Reducing Interest to Four per Cent*, 1694. Barbon answered in *An Answer to Paper Entitled Reasons against Reducing Interest to Four per Cent*, (2 sh. fol.) without, however, giving any further proof for his proposal. In 1695, it seems, was written *An Account of the Land Bank, showing the Design and Manner of the Settlement*, etc. (2 sh. fol.) "Mostly collected out of my writings," says John Briscoe, referring to it in *An Account of the National Land Bank*. Brit. Mus. 816 m. 10; with John Asgill he drafted the rules of the National Land Bank; *The Settlement of the Land Bank* (Lord Somers's Tracts, vol. xi.), 10th August 1695. The last work of Barbon is *A Discourse Concerning Coining the New Money Lighter. In Answer to Mr. Lock's Considerations about Raising the Value of Money*. By Nicholas Barbon, Esq., 1696. Referring to the definition of money in his former work he advocates the well-known project of W. LOWNDES of "raising the coin." He thinks that a recoinage according to the old standard would effect a want of specie, and that the steady rise of bullion made a proportional raising of the value of coin necessary. For "the Balance of Trade (if there be one) is not the cause of sending away the Money out of a Nation: but that proceeds from the difference of the Value of Bullion in several Countries, and from the Profit that the Merchant makes by sending it away, more than by the Bills of Exchange" (p. 59). This passage, it has been remarked by M'CULLOCH, anticipates the "currency principle" as expounded by RICARDO in his

pamphlet on *The High Price of Bullion*, 1811 (Works, 1886, p. 267-8). In order to prove the expediency of his proposal, Barbon repeats his doctrine of money as given in the *Discourse of Trade* (p. 20), laying stress upon the maxim, that its value is not given by the quantity of silver in each piece, but by the authority of government. He supports this opinion by most incredible sophisms. He ascribes the affluence of gold to inadequate rating of the value of silver money (p. 77), and he advocates his position by the history of English and foreign monetary policy and legislation (pp. 74-94). Though in this point the opinions of Barbon are erroneous he, however, attacks very ably Locke's theory that the value of money was the result of common assent (p. 9). Barbon distinguishes, with great ingenuity, between the value and the "virtue" of a thing, the latter being the same at all places, the former varying according to its plenty or scarcity (p. 7). His refutation, in this work, of the doctrine of the balance of trade, his remarks on the preference given to gold and silver, which he compares with the fable of Midas, on the restraint on consumption, and in consequence on prohibition of foreign goods (pp. 35-49), are developments of opinions expressed in his former writings. There is, according to him, but one infallible symptom to know when Trading Nations grow rich: by the increase of population manifesting itself by the enlargement of towns and also of the naval strength (p. 52).

[The *Discourse of Trade* is quoted by E. H., *Reasons for the Abatement of Interest to four in the Hundred*, 1692, p. 6.—E. H. wrote: *Decus et Tutamen; or our New Money as now coined in full Weight proved to be for the Honour, Safety, and Advantage of England*—written by Way of Answer to Sir Richard Temple and Dr. Barbon, 1696. On the latter cp. McCulloch, *Literature*, p. 157.—M'Leod, *Dictionary of Political Economy*, pp. 232, 233.—K. Marx, *Capital*, vol. i. pp. 2-4.—Cunningham, *The Growth of English Industry and Commerce*, p. 351, 368, ed. 1882.—C. Walford, *Insurance Cyclopædia*, vol. i. p. 251, vol. iii. p. 459, and the present writer on Nicholas Barbon, in "Ein Beitrag zur Vorgeschichte der Klassischen Oekonomik," Conrad's *Jahrbücher für National-ökonomie und Statistik*, xxi. Bd. N.F. p. 561-590 (1890).] s. B.

BARING, SIR FRANCIS, Bart., was born in 1740, of German extraction, the founder of the famous financial house of Baring Brothers and Co. Erskine styled him "the first merchant in Europe." He died 11th September 1810.

He wrote—

The Principle of the Commutation Act Established by Facts, London, 1786, 8vo (two editions; supports the reduction of duties on tea and other commodities).—*Observations on the Establishment of the Bank of England, and on the Paper Circulation of the Country*, London, 1797, 8vo.—*Further Observations*, London, 1797, 8vo (describes the panic of 1793, and supports the policy of restriction).—*Observations on the Publication of W. Boyd [entitled Letter on the Influence of the Stoppage of Issues in Specie]*, London 1801, 8vo. H. R. T.

BARNARD, SIR JOHN, was born at Reading,

of Quaker parents, in 1685, and died at Clapham, 1764. He entered the London wine trade, was M.P. for London from 1728-1761, and was knighted in 1732. He was chosen lord mayor in 1737, and opposed Walpole; ultimately he became one of the foremost financial authorities in England, and helped to abate the run on the Bank of England in 1745. He wrote—

Reasons for the Representatives of the People of England to take advantage of the Present Rate of Interest for the more Speedy Lessening the National Debt, London, 1737, folio (detailing an unsuccessful proposal made by Barnard in parliament to reduce the rate to 3 per cent).—*A Defence of Several Proposals for Raising of Three Millions for the Service of the Government, with a Postscript on Publick Credit*, London, 1746, 8vo.—*Letter to an M.P. on the Rejection of the Scheme*, London, 1746, 8vo.—*Considerations on the Proposal for Reducing the Interest on the National Debt*, London, 1750, 8vo (recommending Pelham's project).—*Some thoughts on the Scarcity of Silver Coin, with a Proposal for Remedy*, London, 1759, folio (single sheet). H. R. T.

BARRATOR. One who incites to litigation or quarrels. A person who is found to be a common (habitual) barrator is guilty of the offence of barratry, which is punishable by imprisonment and fine; and if the offender's profession be in any way connected with the law, he may also be forbidden to practise for the future. The word barrator in a now obsolete sense also implied a deceitful person, and from the word in this sense the expression barratry as used in maritime law is probably derived. In this application the word means a wilful or grossly negligent act of the master of a ship by which the owner is damaged. Barratry is one of the risks generally excepted in bills of lading, and it is one of the perils insured against on ordinary marine insurance policies. E. S.

BARRINGTON, SHUTE (1734-1826), successively Bishop of Llandaff, Salisbury, and Durham. He established in 1795 one of the earliest co-operative stores at Mongewell (Oxfordshire). He was president of the Society for Bettering the Condition and Increasing the Comforts of the Poor (1796).

[Bishop Barrington's practical work is fully described in G. J. Holyoake's *Self-help a Hundred Years ago*, chs. i. iv. viii. xiv. xv. xxviii. 1888 (see BERNARD, SIR THOMAS).—*Dictionary of National Biography*, vol. iii. p. 294.] s. B.

BARTER. In primitive states of society exchange of commodities is effected directly, and without the intervention of money; such a method of exchange is called barter. It is highly probable that loan preceded exchange, at least as regards scarce articles, the more plentiful commodities being distributed amongst individuals in joint or separate ownership. In the case of a loan to a stranger, an owner would not have the same guarantee for the return of the article as if the loan were made

to a member of his tribe, and hence he would require some equivalent in return. Thus we reach exchange in the form of barter.

JEVONS has pointed out the inconveniences of barter: (1) want of coincidence; (2) want of a measure of value; and (3) want of means of subdivision. (*Money, and the Mechanism of Exchange*, London, 1882.) These inconveniences are avoided by the introduction of money (see MONEY), which serves as a medium of exchange. The metals prove to be the most convenient commodities for effecting exchanges, and amongst metals, gold and silver specially possess the qualities essential in money.

But metallic money in bulk is weighty; it can be transmitted to a distance only at considerable expense and risk; whilst its use involves loss by wear and tear. To avoid these disadvantages representative moneys in the form of promises to pay have been introduced.

When promises to pay came to be accepted in return for commodities, it was seen that wherever mutual dealings existed between two persons, equivalent quantities of goods estimated in money could be set off, so as to pay for each other. The origin of this modern system of set off may be traced to the Roman Law (Hunter's *Roman Law*, London, 1885, p. 832). But the system was perfected by the introduction of BILLS OF EXCHANGE and CHEQUES, and the development of the modern clearing system (see CLEARING HOUSE). In foreign trade where two countries are constantly buying the one from the other, bills of exchange enable the goods passing in one direction to pay for those going in the opposite direction, and even where two countries do not have mutual dealings, they will be able to obtain payment for their exports by imports from other countries with which both are accustomed to trade (see Goschen's *Foreign Exchanges*, London, 1888).

In the home trade cheques are used as well as bills. By means of cheques traders are able to transfer portions of their book credit at their banks to third parties in exchange for commodities, and the institution called the Clearing House balances the mutual indebtedness for the traders (Jevons's *Money*). Such a method of exchange is really barter: metallic money being used to compare the values of commodities, and ceasing to effect exchanges, except where a balance of indebtedness can be discharged in no other way.

Barter underlies the distribution of the annual produce of a nation amongst the various classes who assist in production. Though the landlord, the employer, the capitalist, and the labourer, receive their respective shares in money, yet to the economist such money represents only produce or its equivalent in other commodities. For instance, the articles that the labourer buys with his wages are the real return he receives for his services, and his

services may be regarded as bartered for such articles (see Sidgwick's *Political Economy*, bk. ii. ch. i.; Marshall's *Principles of Economics*, p. 395). See TRUCK ACT. J. E. C. M.

BARTER AND EXCHANGE. Barter, as distinct from exchange, is defined by the absence of money both as a medium of exchange and a measure of value. In the absence of a measure of value, complicated transactions between several dealers are hardly possible; and accordingly barter is generally characterised by the absence of competition. In the absence of competition bargains are not determinate in the same sense as in a perfect market. In the former, unlike the latter, case you might suppose the dispositions of the parties, their demand curves or "schedules" (Marshall) known, and yet even theoretically be unable to predict what would be the terms of the bargain (see COMPETITION AND REGULATION; VALUE). As JEVONS says of such a case,—with, in the context, unnecessary emphasis on the *indivisibility* of the commodity exchanged,—"The equations of exchange will fail. . . . I conceive that such a transaction must be settled upon other than strictly economical grounds. The result of the bargain will greatly depend upon the comparative amount of knowledge of each other's positions and needs which either bargainer may possess or manage to obtain in the course of the transaction" (*Theory of Political Economy*, pp. 130-134, 2d ed.) To which Mr. Price adds, "Nor indeed, did they possess the gift of clairvoyance, would the problem be necessarily solved" (*Industrial Peace*, p. 54). It is important to study this property of barter not so much on account of the rudimentary transactions to which the term is properly confined as for the sake of their analogy to the dealings of monopolists and combinations in advanced societies.

[The subject in question is discussed in the following passages. Auspitz and Lieben, *Theorie des Preises*, p. 381.—Edgeworth, *Mathematical Psychics*, pp. 20-56.—"Observations on the Mathematical Theory of Economics," *Giornale degli Economisti*, March 1891.—Marshall, *Principles of Economics*, "Note on Barter,"—Menger, *Grundsätze*, ch. iv.—Price, *Industrial Peace*, pp. 14 and 54.—Sidgwick, *Political Economy*, bk. ii. ch. x.

The formation of appropriate conceptions on the subject is aided by those economists who, improving on the ordinary "Robinsonnade," introduce a second primitive economic man. Good examples occur in Courcelle Seneuil's *Traité théorique et pratique*, and Mr. Gonner's textbook of *Political Economy*. F. Y. E.

BARTON, JOHN, of Stoughton, the author of several clever but somewhat unsound pamphlets.

Observations on the Circumstances which influence the Condition of the Working Classes, London, 1817, 8vo (see McCulloch's *Principles of Political Economy*).—*Inquiry into the Causes of the Progressive Depreciation of Agricultural Labour in*

Modern Times, London, 1820, 8vo (stated to be owing to the depreciation of the value of corn).—*Inquiry into the Expediency of the Existing Restrictions on the Importation of Foreign Corn*, London, 1833, 8vo.

H. R. T.

BASTIAT, FRÉDÉRIC. This well-known French economist, a friend of COBDEN, born 1801 at Mugron, near Bayonne, died 1850 at Rome. But for a few casual circumstances which drew out his literary powers, Bastiat would have died comparatively unknown, his first book only appearing in 1845, five years before his death. He had lived up to that date in retirement, working hard, but producing little. The son of a merchant in the Spanish trade, he was left an orphan when nine years old. As a man, he tried his hand, without great success, first in business, in the establishment of his uncle, then in farming at Mugron on the estate which he inherited at the death of his grandfather, 1825. Appointed after the revolution of 1830 *juge de paix* of his canton, he seemed destined to die in the little town where he had been born, limiting his ambition to the direction of a small scientific society whose discussions appear to have been *de omni re scibili et quibusdam aliis*. His first pamphlets were little memoirs on local matters, the interest of which, notwithstanding the high qualities of style and form they possessed, was necessarily limited to a narrow circle; their titles are *Aux Electeurs du département des Landes* (1830); *Réflexions sur les pétitions de Bordeaux concernant les douanes* (1834); *Le Fisc et la Vigne* (1841); *La question vinicole* (1843); *La Répartition de la contribution foncière dans les Landes* (1844).

To England belongs the honour of having lighted up in Bastiat the sacred fire of thought. An English journal to which he subscribed almost by accident, the *Globe*, informed him of the foundation and progress of the ANTI-CORN LAW LEAGUE, the existence of which was barely known in France. The examples of Cobden, BRIGHT, Thompson, Moore, and Fox roused Bastiat, who resolved to imitate them. A few weeks later and the *Journal des Economistes* received from the farthest end of the district of the Landes a manuscript signed with an unknown name, *De l'influence des tarifs français et anglais sur l'avenir des deux peuples*. The article appeared October 1844, and excited a good deal of attention. The author was asked for more; and the file of *Sophismes Economiques* commenced, to the joy of the opponents, and the confusion of the defenders, of privilege. Nothing is more brilliant, nothing more French, in the best sense of the word, than these amusing pamphlets, in which the most delicate irony and the most pitiless logic are combined, as in the famous *Pétition des fabricants de chandelles, bougies, lampes, chandeliers, reverbères, mouchettes, éteignoirs, et des producteurs de suif, huile résine, alcool, et généralement de tout ce qui con-*

cerne l'éclairage. This petition of the candle makers is a humorous complaint against the sun for spoiling their trade, a petition based on protectionist lines. "We demand," say the petitioners at the close of their arguments,

"Qu'il vous plaise de faire une loi qui ordonne la fermeture de toutes fenêtres, lucarnes, abat-jour, contre-vents, volets, rideaux, vasistas, œils-de-bœuf, stores, en un mot, de toutes ouvertures, trous, fentes et fissures par lesquelles la lumière du soleil a coutume de pénétrer dans les maisons, au préjudice des belles industries dont nous nous flattons d'avoir doté le pays, qui ne saurait sans ingratitude nous abandonner aujourd'hui à une lutte si inégale."

From a purely literary point of view several of these satires are first-rate. At this time Bastiat also wrote his first book, *Cobden et la Ligue ou l'agitation anglaise pour la liberté des échanges*, and finally left Mugron for Paris.

He soon became the most active and dreaded antagonist of the protectionist policy. The war tariffs of the first empire had been continued after the restoration by the monarchy of July (Louis Philippe). The first *Association pour la liberté des échanges* was formed at Bordeaux, February 1846; another was established at Paris the same year with Bastiat as general secretary, and *le Libre Échange* as its journal. This free-trade campaign was roughly interrupted by the revolution of 1848; and the French economists, and Bastiat among them, found themselves compelled to direct their efforts and their forces against the spread of socialism. Bastiat harassed those who followed Louis BLANC, Considérant, P. LEROUX, PROUDHON, with epigrams and refutations, and thus assisted in enlightening the country as to the perils with which the revolutionary UTOPIA threatened it, see *Propriété et Loi, Propriété et Spoliation, Justice et Fraternité*, etc. His conflict with PROUDHON (*q.v.*) on *La gratuité du crédit*, will always be considered one of the most brilliant passages of arms of French economic science at this critical epoch.

At the elections of August 1848, the department of the Landes returned Bastiat to the *Assemblée Constituante*, and May 1849 to the *Assemblée Législative*. Here he rarely spoke. He did not possess the physical qualifications of an orator, and the extraordinary exertions he had imposed on himself since he moved to Paris completed the ruin of his health, previously much shattered. After having victoriously refuted the errors of protection and socialism, he thought it was time for him to formulate what he considered the true economic doctrine, and commenced the publication of his *Harmonies*. In this brilliant work, unhappily never finished, Bastiat shows the contrast between the internal weakness of the artificial organisations which are founded on constraint, and the prosperity spontaneously arising in an economic condition

in which the equilibrium of individual and collective forces results from their free and reciprocal balance. This is the fundamental thought (*idée mère*) on which the *Harmonies Économiques* are based, and granted this as a philosophic basis, it could not have been developed with more skill. Some of Bastiat's opinions have been criticised—notably his theory of value—and he may also be complained of as being too much of an optimist. But for all that no one has succeeded better in making his readers admire the science which he himself loved so well. Political economy has been indebted to him, both during his short life and after it, for some of its worthiest followers. The first volume only of his *Harmonies* had been published when Bastiat, wearied and worn out, sought rest in Italy. He died in Rome 24th December 1850, as a Christian; his last words were *ja senti*.

[For life of Bastiat, see speech on the occasion of the inauguration of monument at Mugron by M. Léon Sny, 1878. Notices by MM. R. de Fontenay,—F. Passy,—Pailletot,—De Molinari,—Paul Gardella,—Bannard,—De Foville,—A. Courtois fils. Madame Cheuvreux published, 1876, part of the correspondence of Bastiat, *Lettres d'un habitant des Landes*.] A. de F.

BASTIAT AS A THEORIST. The *Harmonies* of Bastiat have not been re-echoed by economists with one accord. According to CAIRNES (*Fortnightly Review*, 1870), "all that is peculiar to his scheme of speculation" rests on his doctrine of service; "and, this failing, the entire fabric inevitably collapses." By "the shifting uses of an ambiguous term" Bastiat confounds what RICARDO and others had distinguished: cases where value is, and is not, proportioned to efforts and sacrifices (see DIFFICULTY OF ATTAINMENT). Value in all cases, according to Bastiat, represents service. "Such a generalisation," says Cairnes, "is no generalisation in the scientific sense of the term; it is a mere confounding of unanalysed phenomena under an ambiguous word." Describing all commercial transactions as a reciprocity of services, Bastiat attempted not only to explain, but to justify the existing régime, and failed in both attempts, which he never ought to have combined (*Fortnightly Review*, vol. viii. p. 426, *et seq.*) Dr. Sidgwick in the third book of his *Principles of Political Economy*, has afforded the most complete refutation of the economic optimists, "of whom Bastiat may be taken as a type" (*ibid.* ch. ii. § 1). Professor Marshall says of Bastiat; "the lucidity of his style caused him to have great vogue; but he really understood economic science, in the name of which he professed to write, hardly better than did the socialists themselves" (*Principles of Economics*, bk. i. ch. iv. § 6, n. 2). COURNOT also should be referred to among the profound and unbiased thinkers who have exposed the un-

scientific character of economic optimism (*Principes de la théorie des Richesses*, 1863, livre iv. *L'optimisme économique*, Cp. *Revue Sommaire*, 1874). A less temperate criticism of Bastiat's theories may be read with amusement in LASSALLE'S *Herr Bastiat-Schulze von Delitzsch . . . oder Capital und Arbeit* (1864); addressed to SCHULZE-DELITZSCH, but striking through him at Bastiat. Lassalle fastens on the weak point, the theory of services, and, with much humour and more insolence, proves it to be "no economic category" (p. 132, *et seq.*) but rather an "economic enormity without parallel"—"Yet this is the only new thing which that clever windbag (*geistreiche Blagueur*) has said in his primer (*ibid.*)."

Severe as are these judgments, and in one case at least exaggerated, they cannot be wholly set aside. But the opinion that Bastiat did not make any considerable contribution to abstract theory is not inconsistent with gratitude to him for having popularised (in the best sense of the term) the discoveries of his predecessors. It is admitted that in the exposure of economic fallacies Bastiat is unrivalled. The same Cairnes who judges the *Harmonies* so severely calls Bastiat to his aid when he is combating economic sophisms (*Leading Principles*, pt. ii. ch. ii.)

[See, in addition to the authors who have been mentioned as critics of Bastiat, Böhm Bawerk, *Geschichte und Kritik der Zinsentheorie* (1884).] F. Y. S.

BATBIE, ANSELME POLYCARPE, born at Seyssan (Gers) 1828, died at Paris 1897. He entered the *Conseil d'état* in 1849, but left it at the *coup d'état* of 24 December 1851, to give himself up to teaching. It was not long before he became first supplementary professor 1857, then full professor, 1862, at the *École de Droit* at Paris, in "Droit administratif" and "Économie Politique." Elected deputy to the *Assemblée Nationale* in 1871, he found his place among the monarchists, and was one of the foremost opponents of the republican form of government. It was he who invented the phrase the *Gouvernement de combat*, a mot which had a great success. In 1875 he was elected a permanent senator. The delicacy of his mode of thought would always have held him back from becoming the champion of the reactionary party.

Besides his works on law, of which the most important is his *Traité théorique et pratique de droit public et administratif* (7 vols. in 8vo, 1862-66), we may mention his economic works, *Le crédit populaire* (1864, 1 vol. in 18mo)—*Tarot, Philosophie, Économiste, et Administrateur* (1 vol. in 8vo, 1866) (couronné by the Institut),—*Nouveau cours d'économie politique*, 1866 (2 vols. in 8vo),—and finally *Mélanges d'économie politique* (*Mémoire sur le prêt à intérêt*, couronné by the Institut, and *Mémoire sur l'impôt avant et après*, 1789-1801, 1 vol. in 8vo). A. C. F.

BATE'S CASE, OR THE CASE OF IMPOSITIONS. The right of the crown to levy customs duties without the consent of parliament had been abolished—at all events in the case of wool—by a statute of 1362, and had not been revived until the 16th century. Mary and Elizabeth had both imposed small duties on articles of commerce, but this had been done with the consent of the merchants, and had attracted no attention. It was reserved for James I., relying upon the subservience of the judges, to make arbitrary customs an important source of revenue. **TONNAGE** and **POUNDAGE**, which had been granted for life to every king since Henry V., included a duty of 2s. 6d. per cwt. of currants. James by his own authority imposed another 5s., and thus trebled the duty. John Bate, a merchant of the **LEVANT CO.**, refused to pay, on the ground that the tax could only lawfully be imposed by parliament. The case was brought before the exchequer court, and the decision of the judges is an important illustration of the legal theories of the Stuart period. They declared that the king's power is of two kinds, ordinary and absolute. His ordinary power is exercised in the interest of individuals, and is limited by common and statute law. His absolute power, on the other hand, is exercised for the welfare of the whole state, and is not so limited. Customs are the effect of commerce; but commerce and all foreign relations, such as war and peace, belong to the king's absolute power. He who has power over the cause has power also over the effect. The seaports are the king's gates, which he can open or shut as he pleases. Hence the customs are subject to the king's absolute power, and can be levied or increased at his will. This decision was acquiesced in at the moment, and enabled James to issue a **BOOK OF RATES** in 1608. In 1610 parliament took the matter up, and protested against the claim to levy impositions without consent. But they failed to carry their bill on the subject, and the decision in Bate's case continued to be legally valid until all arbitrary taxation was swept away by the Long Parliament.

[*State Trials*, vol. ii.—Gardiner, *History of England*, vol. ii.—Hallam, *Constitutional History*, vol. i.]

R. L.

BAUDEAU, NICOLAS, Abbé, born at Amboise in 1730, died, out of his mind, it is believed, about 1792. He gave up his ecclesiastical status to establish, at the end of 1765, the *Ephémérides du citoyen ou chronique de l'esprit national*, a periodical opposed at first to the party of the Economists; but which, by a conversion most honourable to BaudEAU, became, after 1766, the most accredited organ of the **PHYSIOCRATS**. For example, the cause of humanity, and the abolition of negro slavery, were pleaded by him with great warmth. He even invented, to keep these all together, the

word **HUMANISME**. It was not long before he altered the sub-title of his journal to that of *Bibliothèque raisonnée des sciences morales et politiques*. On accepting a canonry in Poland, he handed over, May 1768, to Du PONT (De Nemours) the chief editorship of his review, which was suppressed by order in 1772 (69 vols. in 12mo had appeared). Returning to France, he brought his review out under the title of *Ephémérides économiques ou Bibliothèque raisonnée de l'histoire, de la morale et de la politique* (19 numbers in 12mo, from December 1773 to June 1776). His principal work, was the *Première introduction à la philosophie économique ou analyse des états politiques*, in which he refuted brilliantly the Abbé **GALIANI** (1771, in 8vo, inserted in the collection of the principal economists published by Guillaumin). This secured him a high place among the economists of the school of the Physiocrats. His restless spirit, his changeable disposition, and the want of financial order in his private affairs, brought on him criticisms sometimes not undeserved.

A. C. F.

BAUDI, CARLO, di Vesme, was the author of one of the best books on the history of landed property in Italy from the fall of the Roman empire up to the establishment of feudalism. (*Vicende della proprietà in Italia dalla caduta dell'impero romano allo stabilimento dei feudi*, 1836, Torino). The academy of Turin honoured this work by a prize. Baudi di Vesme also gained a prize from the Académie des Inscriptions et Belles Lettres for a book on the question of taxation in France under the first two dynasties: *Tributi nelle Gallie durante le due prime dinastie*. He edited the *Laws of the Longobards*, and wrote a book on the political and economical condition of Sardinia: *Considerazioni politiche ed economiche sulla Sardegna*.

Baudi was born at Cuneo 1809, and died 1877. He was educated by the Jesuits, and became famous as a Latin and Greek scholar. In 1837 he was made a member of the Academy of Turin, and in 1850 a senator.

M. P.

BAUMSTARK, EDWARD (1807-1889), an eminent German economist, born at Sinzheim, became privat-docent in cameral science at Heidelberg in 1823, was appointed professor at Greifswald in 1843, and the same year was made director of the economic academy at Eldena. He was Geheimer Regierungsrath, and sat in the Prussian Herrenhaus, acting in politics with the national liberal party. He died 8th April 1889. The earlier of his two principal economic writings, *Staatswissenschaftliche Versuche über Staatskredit, Staatsschulden, und Staatspapiere*, 1833, is founded mainly on the *Oeffentliche Credit* of **NEBENIUS**, but contains some independent investigations. His most valuable work was his excellent translation of **RICARDO'S Principles**—*David Ricardo's Grund-*

gesetze der Volkswirtschaft und Besteuerung übersetzt und erläutert, 1838, which first made that writer's doctrines generally known in Germany. Though strongly influenced by the abstract method of his English master, he recognised his inferiority to Adam SMITH, and saw the importance of the historical direction in economic studies. He gave explanations on profit, rent, price, taxes, paper money, and public debts, which contributed to the right understanding of Ricardo; improved the language in which his doctrines had been stated, and corrected the exaggerations of his followers. In 1835 he published a *Cameralistische Encyclopädie*, which took rank as an instructive work for the use of German officials. He was also author of a treatise *Zur Einkommensteuerfrage*, 1860.

[Roscher, *Nat. Oek. in Deutschland*, p. 909.]

J. K. I.

BAXTER, ROBERT DUDLEY, an eminent statistician, was born in Doncaster 1827, and died at Hampstead 1875. He belonged to the well-known legal firm of Baxters & Co. He combined in a remarkable degree the pursuits of business and literature, the character of a man of science and a love of poetry. His energy in obtaining and classifying information was unbounded, as well as the goodwill with which he imparted it to others.

Baxter's statistical work may be divided into two classes (a) economical, and (b) political.

(a) To the first class belong—(1) *The Budget and the Income Tax*, 1860. (2) *Railway Extension and its results*, 1866—read before the Statistical Society, Dec. 1866, and afterwards published separately; it contains statistics of the growth and distribution of railways, a statement of their cost and estimate of their benefit, both for the United Kingdom and other countries. (3) *The National Income*, 1868—the income of the United Kingdom is estimated as £814,119,000; divided by "the equatorial line of British income," £100 in two nearly equal portions, accruing respectively to those who have more or less than that annual sum. Baxter's estimate of the amount of income which is derived from capital is approved by Sir R. Giffen with some reservation (*Essay in Finance*, series 1; *Essay on Recent Accumulation*, pp. 166-170). The distinction which Baxter makes between productive and unproductive (ch. viii.), "the income that is an original and fresh contribution to the common stock from that which is merely derived from the first," requires consideration (cp. Leone LEVI, *Wages and Earnings of the Working Classes, Reports of the British Association*, 1881, p. 275, and 1882, p. 299). (4) *The Foreign Cattle Market Bill*, 1869. (5) *The Taxation of the United Kingdom*. After a clear statement of the amount of taxation, the writer estimates its distribution and pressure. He pronounces

on "many delicate economic questions, e.g. "Railways and public carriages are obliged to a great extent themselves to bear the contributions levied from them, from the existence of maximum charges limited by law or by the public capacity of paying." He maintains that taxes on property do not become rent charges, and disputes MILL's principle of taxing unearned increment of rent. He settles what proportion of the rates on land and houses are borne by landlord and tenant respectively. He finds that the pressure of taxation on the manual labour classes (eight and a half per cent of workmen's earnings) is heavy in proportion to the taxation of the larger industrial incomes of the upper and middle classes (eight per cent). To estimate the pressure of taxation on the working classes he collected budgets of family expenditure (see WORKMEN'S BUDGETS). Attention should also be called to his estimate of the property of the United Kingdom (in 1869) £6,000,000,000. (6) *National Debts of the World*, 1871. Measured in four ways by: (1) nominal capital; (2) interest actually paid; (3) annual charge per head of population; (4) proportion of annual charge to gross income. The last, which is the most correct method, makes the burden in 1870 hardly greater than in 1700, and less than in 1712. The progress of the indebtedness of the world as compared with the United Kingdom is shown by the statement that, while in 1848 our debt was nearly half, in 1870 it is just a fifth of the total debt of the world. Absolutely, the debt of the United Kingdom was reduced slightly between 1848 and 1870. In respect of the burden of debt there appears a remarkable equality between the United Kingdom and several of her great contemporaries.

The subject is brought down to a later date in (7) "Recent Progress of National Debts," 1874 (*Journal of the Statistical Society*). (8) *Local Government and Taxation*, 1874; containing a criticism of Mr. Goschen's report on the increase of local taxation.

(b) The rest of Baxter's statistical writings are rather political than economical.

(1) *The Volunteer Movement*, 1860. (2) *The New Reform Bill; the Franchise Returns*, etc., 1866. (3) *The Redistribution of Seats and the Counties*, 1866 [with which should be read letters to the *Times* on cognate subjects in the same and the following year]. (4) *Results of the General Election of 1868*, 1869. (5) *History of English Parties and Conservatism*, 1870. (6) *The Political Progress of the Working Classes*, 1871.

[A beautiful picture of Baxter's simple life and a useful analysis of his elaborate works are given in *In Memoriam R. D. Baxter*, by his widow.]

F. Y. E.

BAZAAR. A Persian word meaning a market. In this sense it is employed in India, Turkey, and other eastern countries. In Great Britain the signification of the word has been

corrupted, implying either a collection of shops for the retailing of fancy goods or the temporary opening by amateurs of some place for the sale of such goods and for amusement, mostly for the benefit of a charity. We need only consider the term in the sense in which it is used in the East. There every town of magnitude is possessed of its bazaar, which is the centre of mercantile life, where business both wholesale and retail is transacted, and where news is circulated. The bazaar quarter of the town, is often a collection of streets with shops entirely distinct which constitute the bazaar, while in other cases a square is devoted to the use of the merchants and dealers. A very large amount of business is carried on through the medium of bazaars; and they are a recognised institution of oriental life.

BAZARD, SAINT-AMAND, born at Paris 1791, died at Courtry near Montfermeil, 1832. He was one of the three founders of the society of the CARBONARI (*q.v.*) in France (1821), and joined in the active work of the Saint-Simonians after the death of SAINT SIMON, whom he had never seen. He held an important position as editor of the *Producteur* (1825-26), of the *Organisateur* (second of that name, 1828-30), and of the *Globe* (1831). With ENFANTIN he became the centre of the Saint-Simonian religion; but before long the opinions of Enfantin, particularly on the state of "Woman in the Family," caused him to leave it (January 1832). To explain why he did this he published a pamphlet called *Discussions morales, politiques et religieuses*, January 1832. A. C. F.

BEAR. Under BACKWARDATION the position of a seller who is unable to deliver according to contract has been shown. A Bear is a seller in blank, and from settlement to settlement he must borrow stock on the best terms which he can make in order to arrange the CONTINUATION (*q.v.*) of his contract. The word, no doubt, arose from the belief that one who sells in anticipation of lower prices is a desponding, pessimistic, and misanthropic person, but it has been so long in use that there is no certain knowledge of its derivation. In America one who sells as a Bear of stock is said to be "selling short." The simple adjective "bare" may be the origin of the expression, as, when the time of settlement comes, the Bear seller is bare or short of the security which he has contracted to deliver. When he has "bought back," he is said to have "closed" his "bear." A. E.

BEARER. Bonds to bearer, and sometimes shares, are those which are negotiable instruments on their face. Bearer securities are distinguished, on the stock exchange, from registered securities inasmuch as the title of the former passes from holder to holder, while there is no legal title to a registered share until the owner has had his name placed on the register of the company in which he has acquired

a share or shares (see COMMERCIAL INSTRUMENTS).

A. E.

BECCARIA, CESARE BONESANA (Marquis) born 1735, at Milan, was brought up in a Jesuit college at Parma. Through his interest in different sciences and the circumstances of his life he was led to try his hand at very different subjects, and succeeded marvellously in every one of them. An able mathematician, he wrote a noteworthy treatise on the "nature of style," being an analysis of the principles of aesthetics applied to one of the branches of fine arts (Milan, 1770 vol. i.; the second volume never appeared). He belonged for twenty-five years to the highest magistracy, publishing for the Austrian government excellent reports on corn stores, on the reform of coinage, on measures and weights (proposing a METRIC SYSTEM based on astronomical magnitudes and physical properties, 1780) on demographical questions, etc., marked by great lucidity and precision and full of ideas ahead of his times. His famous little pamphlet, *Dei delitti e delle pene*, published in 1764, has been translated into twenty-two languages. In 1768 a chair of political economy was founded for him by the Austrian government in Milan (the second chair for this science founded in Italy; the first was founded in 1755 in Naples by Bartholomes INTIERI for GENOVESI), and he occupied it for two years. He died in 1793 without having published his lectures, which were first published in 1804 by CUSTODI, and certainly are very remarkable considering they were written before A. SMITH'S *Wealth of Nations*. Beccaria treats political economy as an art to maximise the value of the produce of work, regarding labourers as engines whose *duty* has to be maximised. From this principle he deduces the necessity of a division of labour, a determination of the value of a labourer, and the nature and function of capital. His lectures are also remarkable for an exposition of the laws of growth of population in relation to subsistence, now known as MALTHUS'S theory. Beccaria, however, is not correct, according to our present standard, in sundry other questions, allowing himself to be misled by the prevailing French school, and is in this respect inferior to his friend VERRI. A special mention must be made of a quite small pamphlet Beccaria wrote in a newspaper (*il Caffè*) in 1764 or 1765, under the title, *Algebraical Essay on Smuggling*, in which he solves analytically the problem, "How much of a given quantity of merchandise must merchants smuggle, so as not to be winners or losers, although the remaining portion of the merchandise be confiscated?"

The expression, popularised through Beccaria's influence, "the greatest happiness of the greatest number" (*la massima felicità divisa nel maggior numero*, Preface of treatise, *Dei delitti et delle pene*) is one of those phrases which have penetrated so

deep into the mind of civilised man that some further observations on its origin are advisable. Beccaria says, § 2 of his treatise *Dei delitti et delle pene* (1764), that coldly (rigidly) examining human nature we see that every man is absolutely egoistic, and that on this basis alone legislation can be established, *if it is not to be knocked over constantly*. That nobody cares anything for the universal happiness, or for the good of others, and that "ogni uomo si fa centro di tutte le combinazioni del globo," every man makes himself the centre of all the things that happen in the world. The principle which Beccaria announces may have been suggested to him by his friend Verri, who had written a special treatise on the *Nature of Pleasure and Pain*. Italian economists, contemporary with Verri, were apparently led to give great attention to this subject through the book of De Maupertuis on *Le principe de la moindre action*. They were also greatly influenced by HELVETIUS, who says, *Traité de l'esprit* (1759), vol. i. div. ii. ch. ii. "that the principle of interest is for the moral world, what the principle of gravitation is for the physical one." The general idea is found earlier than the writers cited (e.g. in Fr. HUTCHESON's *Inquiry* (1738), but it is of interest to trace the channel through which it reached English economists (see BENTHAM). M. P.

BECHER, JOHANN JOACHIM (1625?-1685), was the principal representative of Austrian political economy under Leopold I. He was born at Speyer, probably in 1625; he was son of a Protestant minister, but, whilst still young, became a Roman Catholic. He was medical professor and court physician at Mainz. He afterwards removed to Würzburg and Munich, and in 1666 to Vienna, where he was employed in the newly established Commerz-Collegium. He was much busied in the foundation of East and West Indian trading companies, the introduction of foreign branches of industry, and the negotiation of Austrian loans in Holland. Overwhelmed with debt, he fled in 1678 to Holland, whence he passed in 1680 to England, where he died in 1685, having probably again become a Protestant. LEIBNITZ describes him as "un esprit excellent," "Vir summo ingenio," but as morally worthless, insolent, vain, and mendacious. There was in him a large element of the charlatan, but he had great ingenuity, activity of mind, and fertility of invention. He was the originator of potato cultivation in Germany. His *Physica Subterranea* contains the fundamental ideas of the phlogistic system of chemistry; Stahl admitted his obligations to it, and pronounced it to be "opus sine pari, primum hactenus et princeps." His principal economic work was his *Politischer Discurs von den eigentlichen Ursachen des Auf und Abnehmens der Reiche, Städte und Republiken, in specie wie ein Land nahrhaft und folkreich zu machen und in eine rechte Societatem civilem zu bringen*, 1668. It is written in the spirit of the mercantile system, but avoids some of the exaggerations of that system, and shows occasional

insight into juster principles. As ROSCHER remarks, most of the German economists who preceded him had been theologians, philologists, or jurists; he was a student of natural philosophy, and this gives to his writings a special freshness, a freedom from pedantry, and a practical character, which, with his lively and striking style, fitted them to exercise a popular influence, as they in fact did, both directly and still more through his disciple HÖRNECK.

[Roscher, *Gesch. der Nat. Oek. in Deutschland*, p. 270.] J. K. I.

BECKMANN, JOHANN (1739-1811). Beckmann, a native of Hoya in Hanover, became professor of philosophy 1766, and then (from 1770 till his death) of national economy at Göttingen, in his native country. Under Beckmann, SCHLÖZER, and others, Göttingen became the leading university at that date for the social and political sciences. Beckmann has claims to be regarded as the founder of scientific technology, and he had a wide knowledge of the industries, arts, and sciences. Linnaeus was among his friends. He wrote on commerce, agriculture, botany, finance, book-keeping, technology, etc., but the work which has been of most use to economists is his history of inventions, *Beiträge zur Geschichte der Erfindungen* (in five volumes) (1780-1805), part of a series of "Beiträge zur Oekonomie, Technologie, Polizei — und Kameralwissenschaften." The *History of Inventions* has been translated into English, and is included in Bohn's Standard Library; prefixed to that translation there is a good biography.

[For a general list of works, see Professor Elster's article "Beckmann" in the new *Handwörterbuch der Staatswissenschaften*. For criticism, see Roscher, *Geschichte der National-Oekonomie in Deutschland* (1874), p. 912 and note; cp. 582 note.] J. B.

BEDE (see MANOR). A German term for certain exactions paid to the feudal lord by those of his tenants who did not hold by military tenure, or who were not ecclesiastics. Originally payable in kind and determined only by the will of the lord, in most parts of Germany by the 13th century the Bede had become a fixed money payment. This quit rent continued in existence for a long period, and in some parts of Germany was not disused even in the present century. In some cases the rent was paid to another person than the owner of the land, forming thus a kind of rent-charge.

The Bede seems to be analogous to the "red-ditus assisus" or fixed quit rents formerly paid by manorial tenants in England. But it differs from this in the fact that it could not be exacted from military tenants, and in other ways. It is also analogous to the French TAILLE but has no connection with any system of taxation. As its name implies,—*bede*, a request, a prayer—it is a BENEVOLENCE extracted from the tenants by their feudal chief. Compare the old

English words "bederipe," a day's reaping due from the tenants at the lord's request, boon-erth, a day's ploughing, boon-days, a day's labour, and the Latin phrases "preces," PRECARIUM. Conrad, *Handwörterbuch der Staatswissenschaften*, s.v. 1889. C. G. C.

BEEKE, REV. HENRY, born at Kingsteignton, Devonshire, 6th January 1751, educated at Cambridge, where he proceeded M.A. 1776; D.D. 1800. He was professor of modern history in 1801, Dean of Bristol, 1814; and died 1837 (see ARITHMETIC, POLITICAL. HISTORY OF).

Observations on the Produce of the Income Tax, pt. i., London, 1799, 8vo; new and corrected edition, with additions, London, 1800, 8vo (an able defence of the tax, showing the economic state of Great Britain at the time. An appreciative account of Beeke's work is given by Mr. Giffen in his *Growth of Capital*, 1890). H. R. T.

BELDAM, reputed author of *Considerations on Money, Bullion, and Foreign Exchanges; being an Inquiry into the present state of the British Coinage, particularly with regard to the scarcity of Silver Money, with a view to point out the most probable means of making it plentiful* (London, 1772).

[*Monthly Review*, 1772, vol. xlv. p. 243. See also Jevons's *Currency and Finance*, p. 368.]

F. Y. E.

BELL, WILLIAM (1731-1816), prebendary of Westminster and treasurer of St. Paul's, was a fellow of Magdalene College (Cambridge); here he obtained one of Lord Townshend's prizes by the work which entitles him to be considered as an economist—A dissertation on the following subject: *What Causes principally contribute to render a Nation Populous? And what Effect has the Populousness of a Nation on its Trade?* 1756. In 1751 HUME had maintained, in opposition to MONTESQUIEU (*Lettres Persanes*, cxii.-cxxxiii. and *Esprit des loix*, l. xxiii. chs. 17-29), the superior populousness of the modern world (see Hume's *Essay on the Populousness of Ancient Nations*, and *Philosophical Works*, vol. iii. p. 56, ed. Greene and Grose). In this Hume had been criticised by R. WALLACE (1753), who asserted that modern arts and institutions tended to diminish population. Bell has probably been inspired by this writer. Commerce and the arts have, according to him, a tendency to diminish population, for there are not "any bounds originally prescribed to humane nature" (p. 2). They divert production from being employed upon the necessities of life; make, through the influx of money, the prices of provisions high, and render the support of families difficult; whereas agriculture and the more useful arts, by lowering prices, must cause a fall of wages, but in what proportion the author holds to be "an idle and useless curiosity" (p. 19). To secure agriculture and the more necessary employments, Bell thinks that "of all political institutions none seems more immediately requisite . . . than

an equal division of lands" (p. 24). He proposes, therefore, that the right of PRIMOGENITURE should be abolished and a more equal division established between all the children of a family" (p. 28). He recommends a republican form of government, as most favourable to the increase of population (p. 29). Only after a considerable increase thereof should commerce be introduced. This dissertation has been assailed by William TEMPLE, a clothier of Trowbridge, in *A Vindication of Commerce and the Arts*, by J— B—, M.D., London, 1758. It was translated into German under the title: *Wilhelm Bells, M.A. zu Cambridge, gekrönte Preisschrift von den Quellen und Folgen einer Starken Bevölkerung*, 1762, and Vienna, 1768.

[M'Culloch's *Literature*, pp. 51, 52.—*Dictionary of National Biography*, vol. iv. pp. 176, 177.—Macleod's *Dictionary of Political Economy*, p. 260. The *Vindication* is erroneously ascribed to Bell.] S. B.

BELLERS, JOHN, member of the Society of Friends, born about 1654, became joint-lord of the manor of Coln St. Aldwyn's, Gloucestershire, and devoted himself to philanthropic projects, in some of which he anticipated John HOWARD. Died in London, 8th February 1725. Among his numerous pamphlets are—

Proposals for Raising a Colledge of Industry, London, 1695 and 1696, 4to (the rich are to provide the capital and derive profit from the college, in which destitute men and women are to find work, and a resort in old age or illness; reprinted in R. Owen's *New View of Society*, 1818; see also Eden's *State of the Poor*, i. p. 264 etc.; K. Marx's *Das Capital*, and H. M. Hyndman's *Socialism in England*, 1888, p. 65 etc.)—*Essays about the Poor, Manufactures, Trade, etc.*, London, 1699, 4to.—*An Essay for Employing the Poor to Profit*, London, 1723, 4to. H. R. T.

BELLITI, GIACINTO, author of *Considerazioni sulla libertà dell' annona e sull' abolizione della assisa del pesce*, Napoli, 1791, strenuously defends free trade, much in the same way as CANTALUPO (q.v.) ("Domenico di Gennaro, duca di Cantalupo") had done in 1785 in his *Annona*. M. P.

BELLONI, GIROLAMO, was a Roman banker who wrote, in 1750, an *Essay on Commerce* (*Dissertazione sopra il Commercio*) which had an extraordinary success. It was translated into several languages (including English, London, 1752), and the pope Benedict XIV. (Lambertini) made the author a marquis for it. In 1757 a second Italian edition appeared, and in the same year a *Letter on Imaginary Money*. In the *Essay on Commerce* Belloni does not show himself possessed of any superiority over economists who were his predecessors, like LOCKE, MELON, BROGGIA and GALIANI, and his great success is the more difficult to understand as his book is not free from some very gross errors, which even in his time ought to have been avoided by an acute and learned writer.

An example of such errors is his approval of measures tending to prohibit the exportation of coin. His writings have been collected by CUSTODI in his *Raccolta degli Economisti classici italiani*. M. P.

BENEFICE (1). This term was applied during the Early Middle Ages to lands held of a person who retained the ownership by a tenant who enjoyed the usufruct. A tenure of this kind, revocable at the will of the owner, and known as a *precarium*, was occasionally to be found in the Roman republic. Under the empire it appears more frequently; and, where the conditions of the grant are light, it is naturally described as a *beneficium*. Under the Merovingian kings the tenure became still more common; partly owing to the action of the great ecclesiastical proprietors, who by grants of this kind to dependant tenants secured the cultivation of their estates; partly owing to the surrender of their lands by the weak to the more powerful on condition of being allowed to retain the usufruct. The usual condition of a *beneficium* was a periodical payment in money or in kind; it was not associated with military service until the 8th century. At first revocable at will, and then granted only for a short term of years, by the middle of the 9th century *beneficia* had come to be regarded as hereditary. By that time, also, the beneficiary tenure had become the almost universal form of land-holding by persons above the rank of *VILLEIN*; a change which was largely due to the action of Charles Martel and the early Carolingian princes, who forced the ecclesiastical proprietors to give up large portions of their estates to secular hands, while allowing them to retain the nominal ownership. The conjunction of the beneficial system with the vassal relation—with which originally it had nothing to do—ultimately created feudal tenure, such as it was to be found in the greater part of western Europe.

[The clearest account of the early history of *precaria* and *beneficia* is by Fustel de Coulanges, "Les Origines du Régime Féodal" in *Revue des Deux Mondes* for 15th May 1873. On the Merovingian and Carolingian *beneficium*, the standard works are those of Georg Waitz, *Deutsche Verfassungsgeschichte*, vol. ii. (2d ed. 1870), vol. iv. (2d ed. 1885), and Paul Roth, *Geschichte des Beneficialwesens* (1850), and *Feudalität und Unterthanenverband* (1863), who, however, differ in important points. For brief summaries, see Stubbs, *Const. Hist. Engl.*, vol. ch. ix.; and Felix Dahn, *Deutsche Geschichte* (1888), bk. v. ch. vi.]

W. J. A.

BENEFICE (2). An ecclesiastical living or promotion. The word *beneficium* was applied to portions of land granted by a feudal lord to his followers (see **BENEFICE** No. 1), but afterwards it came to be restricted in a general sense to church preferments and dignities, and in a narrower sense to rectories, vicarages, and per-

petual curacies, which were endowed with lands and tithes. The perpetual right of presentation to a benefice is called an advowson and is regarded as a hereditament of an incorporeal nature. The right of next presentation is only personal property. No one but a priest can hold a benefice, and benefices to which the cure of souls is attached cannot be charged with payments to other persons.

[*The Ecclesiastical Law of the Church of England*, by Sir R. Phillimore, London, 1873.]

J. E. C. M.

BENEFICIUM CEDENDARUM ACTI-ONUM (Scots law term). Right of co-surety to sue for contribution.

BENEFICIUM COMPETENTIÆ. A privilege given by the Roman law to defendants in actions brought by plaintiffs standing in certain relations to them (*e.g.* to fathers in actions brought by their children, to former masters in actions brought by freedmen, etc.) If a defendant availed himself of this privilege, judgment was not given for the amount of the claim, but for such sum as the defendant might be able to pay without depriving himself of the necessities of life. E. S.

BENEFICIUM DIVISIONIS (Scots law). An implied right of a surety to be sued in the first place only for his share.

BENEFICIUM EXCUSSIONIS. A privilege given to sureties in the later Roman law, which enabled them to postpone the payment of the guaranteed debt until the principal debtor had been sued for the amount. E. S.

BENEFICIUM INVENTARII. By the civil law, the property of a deceased person goes to one or more persons who have to pay all legacies and debts, and who, after once having accepted the inheritance, cannot plead insufficient assets, but are personally liable for everything. A person taking an inheritance in this way is called an heir (*heres*) (but it must be remembered that the word "heir" in English law has a totally different meaning). Justinian introduced the *beneficium inventarii* which enables the heir to have an official inventory of the estate made before he accepts the inheritance; when this is done the inheritance is said to be accepted "with benefit of inventory," and the heir is answerable to the extent of the assets only. The rules of law here described are still in force in the countries whose laws are based on the civil law (see for instance the French *Code Civil*, art. 793).

E. S.

BENEVOLENCES. Voluntary grants made to the king on application by him personally, or by letter, or through commissioners. They were first exacted by Edward IV. Though they were declared illegal by 1 Ric. III. c. 2, Henry VII. resorted to them in 1491 and obtained an act (2 Henry VII. c. 10) for the recovery of all sums promised but not paid.

Henry VIII. demanded benevolences in 1528 and 1545, and many sums were given to Elizabeth. During the struggle between the Stuarts and parliament, the crown more than once resorted to this method of raising money. The Petition of Right (1627) expressly declared that no man should be liable to any benevolence or forced loan. J. E. C. M.

[Dowell's *History of Taxation and Taxes in England* (London, 1889).—*Constitutional Law*, by H. Broom, p. 398 (London, 1885).—2 *State Trials*, 899.—12 Coke, *Reports*, 119.]

BENTHAM, JEREMY, philosopher, reformer, and economist, born at Houndsditch, London, 1748, was trained for the bar, but soon abandoned it for a life of study and travel, which a considerable private fortune made possible. Most of his voluminous works were first published in French by his friend and admirer Dumont. Bentham died at Westminster 1832, in his eighty-fifth year.

Bentham deserves a place in the history of political economy, partly from his writings on that subject, perhaps even more from the influence of his philosophy on his friends James MILL and David RICARDO. His first important economical work, the *Defence of Usury*, is a series of lively letters (written from Russia in 1787), in which he appeals to Adam Smith to apply his principles consistently, and withdraw his sanction from "legal restraints on pecuniary bargains." He contends that no man should be forbidden to make his own terms in a bargain relating to money, any more than in any other bargains. He tries to prove, by closely reasoned arguments, that, when the legislature fixes a maximum rate of interest, it does not benefit the right persons, while it corrupts the public by multiplying temptations to law-breaking. He proceeds on the general principle that every man is the best judge of his own interest, and it is for the public good that he should be left free to seek it. Bentham was one of the first economical writers who were completely emancipated from the old prejudices against lending of money at interest; and he combats not only the old arguments against usury, but Adam Smith's special plea that, without a legal maximum, money would pass from the sober people to the prodigals and projectors. The prodigals, said Bentham, would not get it, and the projectors ought to get it. As Adam Smith himself has frequently remarked, all industrial progress depends on the formation of new industrial schemes, or in other words, on the work of projectors. In hindering projectors, therefore, we are hindering the public good. So argued Bentham; and Adam Smith is said to have confessed (before his death, in 1790) that in this point the disciple had bettered the instruction of his master. Both in style and in matter this is one of the most masterly of Bentham's economical writings. The praise, however, must be

shared with the *Protest against Law Taxes* (1795), and the *Observations on the Poor Bill of Mr. Pitt*. In the latter, written 1797, he marshals a list of objections expressed in his happiest manner, and acknowledged by PITT to be (in conjunction with the *Essay* of MALTHUS) completely fatal to the success of his bill. The relief of the poor became an object of his thorough and dispassionate investigation, and as a result he submitted to government an elaborate poor-law scheme which anticipated many features of the law of 1834, and was within an ace of being accepted. Bentham was quick to see the affinity of the new economical doctrines of Adam SMITH with his own political philosophy. Even in his economical writings he is evidently more guided by his utilitarian conception of law and government than by purely economical reasons; but he finds the two in harmony with each other; and, in those important cases where political economy is inseparable from politics and legislation, he is original only in the sense of being a very intelligent disciple. His own constructive (as opposed to his critical) work in political economy is most fully presented in the *Manual of Political Economy*. Dumont gave part of this to the world in the Geneva *Bibliothèque Britannique* as early as 1798, and rightly remarks (in his introductory letter there) that, unlike Adam Smith, Bentham is never the historian but always the legislator, and that he laid special stress on the limitation of labour by capital. Whether much or little labour is to be employed in any industry must depend on whether much or little capital is devoted to that industry. This was not a new idea, but it was made more prominent than in the *Wealth of Nations*, from which otherwise the *Manual* differs more in method than in doctrine. Political economy is treated as a science whereby much can be known, rather than as an art whereby government can do much for its citizens. The part of government is, as a rule, to "be quiet" and let self-interest have its perfect work, so that, out of the three classes of measures, the *sponte acta* by the citizens, the *agenda* by the state, and the *non agenda* by the state, the first, in economical matters, must play the largest part. In the *Manual*, indeed, the *non agenda* cover the greatest number of pages; the various forms of mischievous interference by government are described at length, and treated very much as by Adam Smith. They are, however, more plainly declared by Bentham (as later by COBDEN) to be not simply unwise, but unjust. Colonisation is regarded as a loss to the mother country and a gain to the world, a view which led Bentham, in his capacity of French citizen, to advise the French (in 1793) to emancipate their colonies. DRAWBACKS and BOUNTIES are condemned; but the granting of a patent to inventors is strongly commended, and the expense of procuring one is denounced as unjust.

In a passage, which does not appear in the *Bibliothèque Britannique*, and may have been written after Malthus's *Essay*, premiums on large families and similar encouragements of population are condemned: "As well make institutions to punish men for not eating, or pay them for eating, with premiums for them who eat most and oftenest." In regard to finance, Bentham considers that the best tax is the extension of escheats on failure of near relations (which is also the subject of a separate pamphlet), and the worst taxes are those on law proceedings. "In law a tax is a prohibition to every man who cannot pay the tax; this is understood in trade, but seems not to be understood in anything else," he says in his *Conversations*. He thinks well of the redemption of the national debt by an (inviolable) sinking fund, considering that the money employed in reducing the debt is, at the time of repayment, a positive addition to the productive capital of the country. This may be doubtful doctrine; but no exception can be taken to the main reason given for repayment, namely, that "sum for sum the enjoyment produced by gain is not equal to the suffering produced by loss. In this difference, traced through all its consequences, lies the mischief, and the sole mischief, of bankruptcy, or of theft." In dealing with special economical doctrines Bentham is not, on the whole, in advance of his master, while we miss, throughout, his master's continual illustrations from life and history. His distinctions are often expressed in philosophical terms, without thereby becoming either more subtle or more profound. National wealth, as the total of the means of subsistence or enjoyment, is distinguished from national opulence or "relative wealth," which varies inversely with population. He describes the "final cause" of wealth as well-being, and the "material cause" as "the matter of wealth considered in respect of its possessing or being capable of possessing *value*, namely, *subservience to well-being*, the final cause." (We may compare with this the casual remark in his *Conversations*, "the value of money is its quantity multiplied by the felicity it produces.") In regard to machinery, he seems to have arrived at a conclusion similar to Ricardo's in its final form. After an invention (he says in a passage which is not given in the *Bibliothèque Britannique*, and may be later than 1798): "Without an addition to the mass of pecuniary capital, which is a circumstance accidental and not belonging to the case, the retaining of the same number of hands would in no instance be possible, for the production and keeping up of the machinery or other auxiliary means would always require a considerable quantity of labour, the payment of which would be attended with a proportionable mass of expense, by which a proportionable part of the capital would be absorbed;" and therefore the introduction of machinery may certainly

(he thinks) be an immediate evil to the labouring classes. Bentham can hardly, in this case, be said to give us both sides of the question. But there are other economical problems on which he barely touches at all. RENT is not discussed, and the distinction of cost from value is the subject only of passing allusion (in the *Conversations*). The assertion of KARL MARX that Bentham was the author of the theory of a wages fund rests on no stronger evidence than the passage above quoted about machinery. The statement that labour is limited by capital does not by itself imply so much. It is difficult to be certain how much of the *Manual* is of the 18th century and how much of later date; and we cannot give its author the credit of every novelty that distinguishes his treatise from the *Wealth of Nations*. But it is clear that Bentham, if not an economist of the first rank, was at least well abreast of the times.

But Bentham's political philosophy has exerted a much greater influence on political economy than his own directly economical writings. Through James Mill and Ricardo political economy came to be identified (not merely with utilitarianism, with which in some degree it had already been identified by Malthus), but with Bentham's peculiar form of utilitarianism. How closely the two were associated in the popular mind we may see from CARLYLE's early writings, in which the monster "Utilitaria" and the "dismal science" are constantly presented as different phases of one and the same deadly error. "The greatest happiness of the greatest number," a neat democratic formula used by Beccaria in his *Treatise on Crimes and Punishments* (1764), and by Dr. Priestley¹ in the *Essay on Government* (1768), was announced by Bentham (in his *Fragment on Government*) in 1776 to be the ruling principle and chief end of the legislator; and the unhampered working of commercial ambition and competition was very easily translated into terms of this formula (see BECCARIA). Whatever distress free competition might inflict on individuals, it tended to the greatest happiness of the greatest number. This was of course substantially the doctrine of Adam Smith himself. The difference between the two philosophers is, that the latter applied the principle to economics alone, and is not rightly described as being, in philosophy, a utilitarian at all. In economics he thinks he can show that individual men left to follow their separate self-interest without let or hindrance from the state will unintentionally accomplish results that are for the public good,

¹ "Priestley was the first (unless it was Beccaria) who taught my lips to pronounce this sacred truth; that the greatest happiness of the greatest number is the foundation of morals and legislation" (*Commonplace Book*, 1781-85; *Works*, x. 142, cp. 567 note). The phrase occurs in Hutcheson's *Inquiry into Beauty and Virtue*, etc., 1738, p. 181. Comp. Mr. C. F. Montague's edition of the *Fragment on Government*, introduction, pages 33, 34 (Clarendon Press, 1891)

namely, the greatest wealth and commercial prosperity possible to their community. Adam Smith, in short, abstracts, not very rigidly, and in one class of actions only, from all motives but self-interest. Bentham, on the other hand, makes use of the same abstraction, not in one class, but in the whole range of actions falling under consideration of political philosophy. Not only in economical matters but in politics and general life, "there is no true interest but individual interest." Man is under two masters, pleasure and pain, and his action results from a calculation of the balance of consequences in favour of greater pleasure or less pain to himself individually. On the other hand, the same Bentham considers that the aim and intention of all legislation (as distinguished from the unintended result of actions let alone by the law) must be "the greatest happiness of the greatest number," which is a general and not an individual interest. It is hard to reconcile this regard to the general interest with Bentham's extreme individualism. He tries to do so, when he says it is imperative that the individual interest of the ruler should be one with the general interest of the ruled; but he does not explain how Bentham the legislator, being a mere man, can rise to a view in which his individual interest is certainly lost in the general. This is not the place to discuss the philosophical question; and it must be granted that, once Bentham has made his logical leap from the individual to the general happiness, he guides himself strictly by regard to the latter even in matters of trade, and has no faith in an absolute "harmony" of unregulated interests. He was an advanced free-trader; but we can see, from such proposals as those for the extension of escheats and for the taxation of bankers and stockbrokers, that his maxim of "greatest happiness" had lifted him above the extreme form of *laissez-faire*. The same maxim, when interpreted as a claim for equality of treatment for all members of the state ("every one to count as one and no one as more than one"), had much to do with the influence of the followers of Bentham ("the Philosophical Radicals"), represented by the early *Westminster Review*; and the close association of Bentham's politics with Ricardo's economics may therefore have helped in many quarters to secure a hearing for the latter during the crusade against the corn laws.

The philosophy of Bentham has influenced political economy in another and very different direction. The idea of a calculus of pains and pleasures which is used by JEVONS and others in building up the economic theory of value is founded (especially in the case of Jevons) very largely upon the suggestions of Bentham; and, even if the theory of final utility can be stated quite apart from any utilitarian psychology, it was certainly in the language of this psychology

that it was first formally expounded by English writers.

It should be added that, like all the great modern economists, Bentham was devoted to the cause of education, especially the education of the labouring classes, whom he regards as the most valuable part of the community. He took shares in Robert Owen's factory in New Lanark, when (in 1813) OWEN bought out the old partners. His writings on education are hardly less numerous than those on legislation.

[His works and life, edited by Bowring, with an introduction by Hill Burton, fill eleven volumes, of which the tenth and eleventh contain the *Life* (Tait, Edinburgh, 1838 *seq.*) His chief economical works are: (vol. ii.) *Protest against Low Taxes, Supply without Burden, Tax with Monopoly* (i.e. a tax on bankers and stockbrokers); (vol. iii.) *Defence of Usury and of Projects in Arts, Manual of Political Economy, Conversion of Stock into Note Annuities, Invention and Discovery*; (vol. iv.) *Hard Labour Bill, Emancipate your Colonies*; (vol. viii.) *Tracts on Poor Laws and Pauper Management, Observations on the Poor Bill of Right Hon. William Pitt*. The treatises on *Rewards and Punishments* (vols. i. and ii.) have frequent economical references, though those of greatest length in the original edition have, in the collected works, been transferred to the *Manual*.

The *Manual*, together with the *Principles of Legislation*, has been in great part reproduced in the volume on "Bentham" (ed. Raffalovich) in the *Petite Bibliothèque Economique* (Guillaumin, 1888).

Critical estimates of Bentham's general work will be found in J. S. Mill's *Dissert. and Discuss.*, i. 330 *seq.* (from *Westminster Review*, August 1838), and in Adolf Held's *Soziale Geschichte Englands*, article "Bentham" (1881), and in an article by Prof. H. Sidgwick on "Bentham" in the *Fortnightly Review*, 1877 (comp. also account of Bentham's first principle in Prof. H. Sidgwick's *History of Ethics*). J. S. Mill's *Autobiography* brings out the influence of Bentham on Mill and Austin and the philosophical radicals in general. See also Bain's *Life of James Mill*, 1882.] J. B.

BEQUEST, POWER OF. The power of bequeathing property on death has descended to modern nations from the Roman law, which permitted three-fourths of the inheritance to be willed away from the next-of-kin. The Koran recognises a similar principle as regards two-thirds of a man's property, and the Mishna recognises gifts of property to take effect on death; but it is probable that these provisions are traceable to the influence of Roman law.

Under the feudal system a vassal was not permitted to substitute a stranger in his place without his lord's consent (2 Coke, *Inst.* 7), and the early English will was restricted to personal property. At common law, a man if he left a widow and children could bequeath one-third of his personality; if he left only a widow or only children he could bequeath one-half; and if he left neither widow nor children he

could dispose of the whole (2 Blackstone's *Commentaries*). Some writers think that the above rules only prevailed when supported by special custom (Williams on *Executors*). By imperceptible degrees full power of bequest was introduced, except in the province of York, Wales, and the city of London, but by the 4 & 5 W. & M. c. 2, explained by the 2 & 3 Anne, c. 5 for York; 7 & 8 Will. III. c. 38 for Wales, and the 2 Geo. I. c. 18 for London, the special customs prevailing in these places were abolished.

As regards real property, the refusal of the common law to permit bequests led to the invention of uses and trusts by means of which land was devised indirectly. After the attempted abolition of uses by Henry VIII. the inconveniences arising from the want of testamentary power resulted in the 32 Hen. VIII. c. 1, which permitted a will to be made of all land held by SOCCAGE and two-thirds of land held by knights' service tenure. The 12 Car. II. c. 24 abolished tenure by KNIGHT'S SERVICE, and the 55 Geo. III. c. 192 made COPTHOLDS devisable.

The practice of entailing land by settling it upon a number of life tenants in succession has greatly curtailed the freedom of bequest, as the estate of a life tenant must end with his death (see SETTLEMENT). In the United States and in Canada, Australia, and other English colonies, freedom of bequest is the general rule, as their legal systems are based on English law. In Scotland and on the continent of Europe the principle of the Roman law,—reserving a certain portion of the inheritance (*legitima portio*) for the heir has been followed. The law of Scotland gives the widow one-half the movable property if there are no children, one-third if there are children; one-third if there be a widow, one-half if there be no widow is reserved for the children; what remains may be bequeathed.

The portion of the property that may be bequeathed in the chief European countries is as follows:—

In AUSTRIA: one-half if there are descendants, two-thirds if ascendants only, the whole if neither ascendants or descendants. *Aust. Civ. Code*, par. 765, 766, 951.

In BAVARIA: one-half if there are five or more children, two-thirds if there are four or fewer children. *Bav. Civ. Code*, § 15.

In DENMARK: one-third if there are descendants, the whole if no descendants. *Dan. Civ. Code*, 262, 263. Special provisions regulate the bequest of a Soedegaard or "family seat," of a Bøndergaard or "estate let to peasants." New entails are prohibited.

In FRANCE, BELGIUM, and HOLLAND: one-half if there is one child, one-third if there are two children, one-fourth if there are three children, and so on.

In GERMANY: various regulations prevail, but there is a universal rule that a proportion, varying in the different states, cannot be bequeathed away from the nearest relatives

In GREECE: a share equal to that which on an equal division would descend to each of his direct heirs.

In ITALY: one-half if there are descendants, two-thirds if there are ascendants only, the whole if neither descendants or ascendants. *It. Civ. Code*, 805.

In NORWAY: one-half if there are descendants, the whole if no descendants.

In PORTUGAL: one-third if there are ascendants or descendants.

In PRUSSIA: all the property, but this power is greatly limited by the existence of settlements, hereditary estates, and by the customs of particular localities.

In RUSSIA: (1) all acquired property; (2) all patrimonial property if there are no descendants. By the Emancipation Act of 1861 the descent of property of the peasants is to be governed by local usage. The communal organisation still prevails in Russia.

In SPAIN: one-fifth if there are descendants, one-third if there are ascendants only, the whole if there are neither ascendants nor descendants.

In SWEDEN: in towns one-sixth of the property if there are children, one-half if there are relatives only in the country, the whole if there are no relatives living.

In SWITZERLAND: each canton has its own regulations, see *Les Législations Civiles des Cantons Suisses*, par C. Lardy, Paris, 1877.

Mill in his *Political Economy*, bk. ii. c. ii., and bk. v. c. ix., discusses the extent to which freedom of bequest should be permitted.] J. E. C. M.

BERKELEY, GEORGE, Bishop of Cloyne, Ireland, born 1685, died 1753. Bishop Berkeley's principal contributions to economic thought are contained in the *Querist*; of which the first edition appeared, in three successive parts, 1735-37. A second edition, increased by a few queries, and diminished by many, was issued in 1750. The portions of the first edition which did not reappear in the second are printed by Professor Fraser as an appendix to the third vol. of his edition of Berkeley's works.

Berkeley anticipates ADAM SMITH in conceiving wealth and welfare philosophically; and is free from the errors of the mercantile system (*Queries* 556-561, and *passim*). He rightly states several technical points, as that "interest measures the true value of land" (1st ed. part i. 244), and that the worse currency expels the better (27, 464, 2d ed., 1st ed. part i. 246). Among many eternal verities stand out two or three doctrines which may appear to our generation less certain, or less important, than Berkeley held.

(1) Like CANTILLON, Berkeley ascribes paramount importance to the direction which unproductive consumption takes. "Whether the industry of the lower part of our people doth not much depend on the expense of the upper" (395)? Whether, by housebuilding and similar

expenditures, "much of that sustenance and wealth of this nation which now goes to foreigners would not be kept at home, and nourish and circulate among our own people" (402)? "Whether an Irish lady, set out with French silks and Flanders lace may not be said to consume more beef and butter than a hundred of our labouring peasants" (144)? "of how great consequences are fashions to the public" (99)? "Whether it may not concern the wisdom of the legislature to interpose in the making of fashions" (13)?

(2) The wisdom of the legislature is also to be employed in creating a national bank. The scheme is explained more fully in the first than in the second edition. Berkeley asks "Whether the sure way to supply people with tools and materials, and to get them at work, be not a free circulation of money" (239)? He regards the "promoting of industry" as "the true and sole end, the rule and measure, of a national bank" (314). It may appear to us more doubtful "Whether there be any difficulty in comprehending that the whole wealth of the nation is in truth the stock of a national bank" (438)? And it savours now of heterodoxy to ask "Whether the true idea of money as such be not altogether that of a ticket or counter" (23, 441)?

(3) A less prominent, but still cardinal, part of Berkeley's teaching is that the multitude as well as the quality of population is an element of well-being. "Whether the main point be not to multiply and employ our people" (352)? "Whether it would not be delightful to live in a country swarming, like China, with busy people" (359)?

Some of the suggestions made in the *Querist* are found in the *Essay towards preventing the Ruin of Great Britain* (1721), where, besides inculcating moral reforms, Berkeley proposes to encourage population and manufactures.

BERLIN DECREES. See CONTINENTAL SYSTEM.

BERNARD, SIR THOMAS, BART. (1750-1818), was one of the originators of the co-operative movement in England. He was employed by his father, Francis Bernard, the Governor of the province of New Jersey, as his secretary, and was called to the bar in 1780, but early devoted himself to philanthropical pursuits. Assisted by Count Rumford, Eliot, Wilberforce, and especially by the Bishop Shute Barrington of Durham, he founded in 1796 the "Society for Bettering the Condition and Increasing the Comforts of the Poor," the reports of which are for the most part his personal work. The same benevolent tendencies inspired him to publish *The Case of the Salt Duties, with Proofs and*

Illustrations, 1817, in order to bring about their repeal. Besides the above-mentioned works his "Observations on the different Proposals which have been made respecting the Poor during the two preceding Centuries," are very important, through their wealth of information. They are joined by way of an appendix to: *The Life of Sir Thomas Bernard, Baronet*. By the Rev. James Baker, his nephew and executor, 1819.

[*Dictionary of National Biography*, vol. iv. pp. 387, 388.—G. J. Holyoake, *Self-help a Hundred Years ago*, 1888, ch. iii. ch. iv. ch. vi.] S. B.

BERNHARDI, THEODOR VON, economist, historian, and diplomatist, born at Berlin 1802, died 1887. His youth was spent in Russia. In 1820-23 he studied at Heidelberg, and then, after travelling abroad, settled in Silesia. He was appointed a Prussian "Legationsrath" in 1865, and for some years was actively employed in diplomatic work in Italy, Spain, and Portugal. He is known as an economist by his *Versuch einer Kritik der Gründe welche für grosses und kleines Grundeigenthum angeführt werden*, 1848. "Under this modest title," says ROSCHER, "is concealed a series of thorough-going investigations on the questions which are most important from a general point of view. The whole belongs to the best of what has been written against whatever is one-sided in the doctrines of SMITH, and still more of RICARDO. Were Bernhardi writing in our day, he would without doubt be spoken of as following the same direction as the SOCIALISTS OF THE CHAIR." The point Roscher finds most characteristic in him is the *historical* spirit of his work, seeking, as it does, to explain what are the views of human affairs out of which the opposite doctrines on large and small properties have respectively taken their rise, and with which they must stand or fall. Bernhardi is also author of several valuable works on political and military history. (Roscher, *Geschichte der Nat. Oekon. in Deutschland*, p. 1041.) J. K. I.

BESOLD, CHRISTOPH (1577-1638), the greatest German master of political science in the first half of the 17th century, was born at Tübingen in 1577. After the battle of Nördlingen he announced his conversion to Roman Catholicism, entered the Austrian service, and was for a time privy-councillor. So renowned was he in his own day that the emperor wished him to fill a chair in Vienna, the pope one at Bologna, and the court of Denmark one in that country. He died in 1638 at Ingolstadt, where he was professor. He was characterised by a many-sidedness which, says ROSCHER, reminds us of GROTIUS and SALMASIUS. He was a most voluminous writer on theology and philosophy, law, history, and politics. In his *De Aerario* (2d ed. 1620) he gives a full enumeration of the questions to which statistics should furnish a reply. His economic doctrines are stated in

his *Synopsis politice doctrinæ*, and his *Vita et mortis consideratio politica*, 1623. His views on usury are remarkable, especially when we remember that they long preceded the arguments of Salmasius on the same subject. He denies the Aristotelian doctrine of the unfruitfulness of money, makes loans on INTEREST a case of legitimate *locatio*, disputes the common interpretation of the Jewish prohibition of interest, and only asks for a legal limitation of the rate. He agrees with the mercantile school as to the necessity of preventing the exportation of money and regulating the corn trade, and as to the propriety of sumptuary legislation. His great defect is the unsystematic character of his writings, which often consist merely of *collectanea* from various sources, loosely connected and interspersed with frequent digressions. THOMASius attributes to him "multa diligentia, magnum ingenium," but "exiguum iudicium."

[Roscher, *Gesch. der Nat. Oek. in Deutschland*, p. 195.] J. K. I.

BETTERMENT. A word imported from the United States of America, and denoting an improvement of property. It has recently become familiar in England as the name for a principle of taxation, the adoption of which, for the purposes of local taxation is recommended by some politicians—the principle being that persons benefited by public expenditure should contribute to such expenditure to the extent of the increased value of their property, and this not only if the improvement effected by the public authority was carried out for the purpose of conferring a benefit on such property, but also if the resulting benefit was purely accidental, the expenditure having been undertaken for a totally different purpose. The advocates of the principle assert that it has been recognised by previous legislation both in the United States and in England, and that in extending its application they are introducing no new system of taxation.

As regards England the following instances are given:

(1) Various Sewers Acts, beginning with a statute of Henry VI., by which Commissioners were appointed for the purpose of constructing sewers, drains, seawalls, and other works for the prevention of floods, and for the purpose of apportioning the cost of such works among the owners of property within their respective areas. The Commissioners were to ascertain by whose fault any damage had previously been caused, who was specially injured by the previous state of things, and who would be specially benefited by the new works. These facts were to be considered in the apportionment (see the words of the Commission as set out in 6 Henry VI. c. 5, and 23 Henry VIII. c. 5).

(2) § 159 of the Metropolis Management Act (18 & 19 Viet. c. 120), which enables any vestry and any district board to impose

special rates on any part of the parish or district, or to exempt any part of the parish or district from rates, with respect to expenditure which has been incurred for the benefit of any particular part, or has not been incurred for the benefit of the whole of any parish or district.

(3) § 8 (8) of the Artisans' Dwellings Act (45 & 46 Viet. c. 54—now reproduced by § 38 (8) of the Housing of the Working Classes Act, 1890—53 & 54 Viet. c. 70), according to which the arbitrator appointed under that Act has power, in the case of the compulsory demolition of an obstructive building, to impose a special rate on the owner of a building previously obstructed, to the extent of any increase in the value of such building resulting from such demolition. Other statutory provisions have also been relied upon, but they are either exactly analogous to those mentioned or obviously irrelevant.

It is not difficult to show that the principle brought out in the first two instances is not even superficially analogous to the principle of betterment as defined above. Landowners belonging to a district threatened by floods must take common measures for their protection, and as some individuals are more careless or more selfish than others, public officers are appointed to ensure efficient measures and a just apportionment of the expense. There is here no public expenditure in the proper sense, nor is there any apportionment, based on the increase in the value of property. The Metropolis Management Act, in authorising the subdivision of parishes and districts for rating purposes, only recognises a principle which underlies all local government and taxation; viz. that expenditure incurred for the exclusive benefit of a particular area ought to be borne by the inhabitants of that area. As it often happens that a metropolitan parish or district comprises parts widely separated from each other, and public works undertaken for the benefit of one part may be useless or even hurtful to another part, it would be manifestly unjust to recognise no other area for local taxation except the arbitrary and frequently fanciful area of the parish or district. The Housing of the Working Classes Act seems, at first sight, to come nearer to the principle of betterment than the other statutes mentioned, inasmuch as it expressly declares that the increase in the value of improved premises is to be considered for the purpose of the apportionment of the contributions payable in respect of the compensation to the owners of obstructive buildings, and inasmuch as it introduces special rates upon individuals as distinguished from local areas; but here the analogy ceases. The demolition of an obstructive building is ordered on the ground of its being injurious to an adjoining house, and the primary object of the demolition is, therefore, the benefit of that

particular house. The special rate to be imposed in such a case is to be levied like a private improvement rate under the Public Health Acts; and, like a private improvement rate, it is not a tax in the usual sense of the word, but the repayment of a sum spent by the local authority for the special benefit of the party from whom it is to be collected.

In all these cases the expenditure is to be incurred with the special object of conferring benefits on a particular area or particular persons, and it is from that area or from those persons that the rate is to be collected. As Mr. Pember tersely says in his speech against the Strand Improvement Bill (p. 2): the principle hitherto not departed from is "that the incidence of taxation should be determined by the motive of the expenditure, and not by its accidental results."

The American legislation on the subject has been summarised by Mr. John Rae (*Contemporary Review*, May 1890, p. 644 *seq.*) He defines a betterment tax as "the special assessment of the expense (or part of the expense) of a local improvement on the adjoining property which is specially benefited by the improvement." This definition is somewhat ambiguous, as it is not clear whether such an assessment is to take place irrespectively of the object of the expenditure; and the ambiguity is not removed by the instances which are given of the imposition of a betterment tax, many of which seem explainable in the same way as the English statutes to which reference has been made. It is, however, quite clear that the principle of betterment, even in a more restricted sense, is not recognised in all the States of the Union, and that where it is recognised, the manner of applying it is by no means uniform.

The argument from precedent does not, under these circumstances, seem well founded, and the question as to the advisability of introducing the principle of betterment must be decided on the merits only. Before considering whether the proposed new method of taxation is just or expedient, it will be useful to ascertain how it can be carried out in practice. For this purpose the evidence taken by the Select Committee on the London Streets (Strand Improvement) Bill—a bill promoted by the London County Council and withdrawn after the rejection of its principal provisions—is highly instructive. The object of the bill was the widening of the Strand for the purpose of facilitating metropolitan traffic. This clearly appears from the preamble, which begins: "Whereas obstruction and delay to traffic is caused by the narrowness of the thoroughfare known as the Strand near the Churches of St. Mary-le-Strand and St. Clement Danes, and having regard to the extent and character of the traffic using the said thoroughfare, it is expedient that it should

be widened and improved," etc., but as it was believed that the improvement was likely to cause an increase in the value of the adjoining property, it was proposed to raise part of the expenditure (not exceeding one-half) by contributions from the owners or occupiers of such improved property, which were to assume the form of yearly rent-charges. The bill created a betterment area, and provided that an arbitrator was to determine whether and to what extent the improvement rent-charge was to be imposed on each separate plot within that area. The award was to state (a) the amount of the increased value which would accrue to each plot; (b) the amount of the rent-charge to be apportioned to such plot; (c) the name of the person or persons by whom such rent-charge should be payable (being the owner of, occupier, or person otherwise interested in such plot).

The following are some of the practical difficulties disclosed by the evidence before the Select Committee.

1. The area of betterment was settled beforehand, and the arbitrator had no power to make an assessment on any property outside the area. At the same time the limits of the area were not fixed on any intelligible principle. The surveyor who made the plan almost admits this in his evidence. To the question (p. 101) "Why have you taken one side of Devereux Court and not the other?" he replies: "I am obliged to draw the line somewhere." Later on when asked (p. 103) "Why have you put it [New Court] in the betterment area?" he says: "You cannot always tell the reason why;" and similar answers are frequent. It may be objected that these facts are damaging to the proposed scheme, but not to the principle of betterment, but it is easy to see that the difficulty is not due to the accidents of this particular case. It is quite impossible to fix an area beforehand which is not more or less arbitrary; and if it is left to the arbitrator to find betterment wherever it exists without regard to any area, the difficulty of his task becomes insurmountable.

2. Even within a limited area the arbitrator's work may be so arduous as to become practically impossible. If no time be fixed for the making of the final award, great inconvenience must result; and if a time be fixed, the pressure of time must interfere with the completeness of the inquiry. Mr. R. C. Driver, one of the best known estate agents in London, being asked: "Now, apart from any machinery in this particular bill, do you think from your experience as a surveyor you could deal with this question of betterment?" replies: "I do not know the surveyor at the present moment amongst the whole range of them who is competent to deal with it" (p. 229). It might be said that the difficulty of the inquiry in the particular case was due to the large extent of the area, but it

would never be feasible to apply the principle of betterment to a small area, as no appreciable part of the total expenditure could be recovered in such a case.

3. The arbitrator, before making his award with regard to any particular plot, would have to hear the evidence concerning the whole area (see Mr. Tewson's evidence, on p. 273). There would, therefore, be a period of uncertainty extending over several years, concerning every piece of ground within the area, and as no one would purchase land subject to an uncertain contingent rent-charge, the whole property would become unsaleable during the period of suspense.

4. The arbitrator might find that only a very small part of the area derived any benefit. It would therefore be impossible to estimate beforehand what proportion of the cost would eventually become chargeable to the Metropolis.

5. The metropolitan ratepayers are now paying interest on sums borrowed for other metropolitan improvements which probably have conferred benefits on particular localities. If some inhabitants of the Strand district were made to pay for part of the expenditure by which they were specially benefited, they would be justified in asking for a readjustment of metropolitan taxation, so as to be relieved of part of the burden borne by them for the benefit of other localities.

Apart from these practical difficulties there are serious objections to the proposed adoption of the principle of betterment on grounds of justice and expediency. These may be shortly stated as follows:

1. There is hardly any public expenditure which does not benefit somebody, and it would be obviously unfair to give away these benefits in some cases and sell them in other cases. The erection of the New Law Courts has increased the value of property in the neighbourhood to an enormous extent, yet the cost has been paid entirely from imperial funds.

2. If public bodies may ask for contribution from persons benefited by their expenditure, irrespectively of the objects of the expenditure, private corporations or individuals ought to have the same right. A landowner who rebuilds a particular plot of houses, or plants trees or gardens for the benefit of his own property, may thereby increase the value of property within a whole district. A railway company may open a new area for building purposes; yet the persons benefited are not required to contribute to the outlay.

3. It is dangerous to establish a principle of taxation, the incidence of which, instead of being determined by definite general rules, depends on the discretion of one or more individuals whose fitness cannot be ascertained beforehand, and upon a calculation of probabilities which may and frequently will be erroneous.

4. If the effect of public expenditure on private property is to be considered at all, irrespectively of the object of the expenditure, the loss ought to be considered as well as the gain. If those who benefit ought to contribute, those who lose ought to be compensated. Some of the advocates of betterment recognise this consequence. Mr. James Beal, one of the witnesses called on behalf of the London County Council, in reply to the question (p. 199): "If you adopt that principle without regard to distance, would you also admit that to any distance people might claim, on the other hand, from the Council, for what you call an improvement doing damage to their property?" answers "Certainly." "Can you give any idea to the committee of what the pecuniary ultimate result would be, what your balance-sheet would look like?" "No." "It might turn out to be a very bad principle for you?" "When you assert a principle follow it to the death; do not trouble about results." It should be remembered in reference to the last remark that in this case the persons who asserted the principle were not the persons whom the result would have affected.

The metropolitan authorities have hitherto adopted a plan for obtaining the benefit of a rise in the value of property, occurring in consequence of improvements effected at the general expense, which has produced satisfactory results, and is free from the inconvenience of the betterment tax. This plan is known as the method of recoupment, and is applied in the following manner. The public authority acquires compulsory powers to purchase land beyond the immediate necessities of the contemplated improvement, at a valuation which does not include the prospective increase in value which will be due to improvement. Such land is resold when the improvement is completed, and by the profit on the re-sale a part of the cost of the improvement is repaid. The principal objection urged against this plan is that the price of the compulsory purchase includes trade interests which are destroyed, and that this loss takes away the profit which would otherwise have been obtained on a re-sale. There is not much force in this objection, inasmuch as most of the houses occupied for trade purposes are held by the tenants on short leases, and the public authority can therefore buy the freehold without paying for any trade interests, and allow the leases to run out before re-selling. The duty to re-sell may be postponed for a number of years, so as to allow for time for longer leases to run off. This plan, which is just and fair to everybody concerned, is free from most of the objections against the betterment scheme, and answers every legitimate purpose for which that scheme has been devised.

E. S.

BETTERNESS. A term used in bullion

transactions. It is usual in the older methods of reporting the results of assays, which are still retained side by side with the decimal system of reporting, to refer the proportion of gold or silver in ingots or bars to "standards" for the respective metals. Standard gold contains 22 parts of gold and 2 of baser metal in 24 parts; these parts are called *carats*, the gold carat containing 4 grains, the grain being subdivided into 8 parts. The standard for silver coin and plate consists of 11 ounces 2 dwts. of silver and 18 dwts. of copper in the pound of 12 ounces troy. *Betterness*, and *worseness*, are merely conventional terms which have been adopted for centuries to show how much gold in "carats" and "grains" and "eighths," and how much silver in ounces and pennyweights, the mass of metal contains in addition to, or in defect of, the legal standard, which standard affords the basis for calculating the money value of the metal.

C. R.-A.

BEZANTS. A name given to gold and silver coins which were struck at Byzantium (Constantinople), the capital of the Eastern empire, and which circulated throughout Europe from the 6th to the 15th or 16th centuries. The gold coins were current in England in Anglo-Saxon and Norman times, and may be said to have been used as international money.

Of the original bezants the chief gold coin was called the "**SOLIDUS**" and the silver coin the "miliarion." They were struck about the year 500 A.D., in the time of Emperor Anastasius, and were made of fine metal. They were, however, gradually debased, and by the 15th century, when the Eastern empire fell, they had become greatly reduced in fineness. Their weight also did not remain constant, and it is impossible therefore to say what was their exact value. A gold coin, however, which was probably the largest to which the title bezant could correctly be applied, was issued in the reign of Heraclius (615 A.D.) under the title of "hexagram." The weight of this coin was 105 grains (probably fine gold) and its value in sterling therefore would be 18s. 7d.

The current rate at which gold bezants were received throughout Europe has been estimated at a ducat (9s. 4d.), so that they may be taken as roughly equivalent to a **HALF-SOVEREIGN**; and this estimate would appear to be confirmed by the fact that 200,000 bezants, paid for the ransom of St. Louis of France (1250), were taken as equal to 100,000 **LIVRES** (pounds). Bezants, however, which were distributed at the coronation of Henry II. of France (1547), three centuries later, were equal in value to two **DUCATS**. As, however, it is certain that in the course of time the word bezant came to be applied to any gold coin in common use, quite apart from any consideration of its value or of its place of origin, such discrepancies in their estimated value cannot but be expected to occur.

F. E. A.

BIANCHINI, LUDOVICO, born at Naples 1803, died 1871, was an economist, statesman, and historian of merit. Though much occupied in the highest official positions of the kingdom of Naples, he found time to write many excellent works on economical, administrative, and historical subjects.

His principal economical writings are the following:—*Principii del credito pubblico*, viz. *Principles of Public Credit*, published in Naples in 1827 and 1831.—*Della influenza dell'amministrazione pubblica sulla industria nazionale e sulla circolazione delle ricchezze*, viz. *On the Influence of the State on Industry and Circulation of Wealth*, Naples, 1828.—*Della storia delle finanze del Regno di Napoli*, viz. *History of Neapolitan Finance*, 3 vols., Naples, 1834 and 1839.—*Sullo stato delle ferriere nel Regno di Napoli*, Napoli, 1835.—*Sulla conversione delle rendite inscritte nel gran libro del debito pubblico*, viz. *On the Conversion of the Public Debt*, Naples, 1836.—*Principii della Scienza del ben vivere sociale e della economia pubblica e degli Stati*, viz. *Principles of the Science of Social Welfare*; the first volume, containing the history of political economy, was published in Naples in 1845; the second volume, containing the principles, was published in Italian in 1855, and in French in 1857.—*Storia economica di Sicilia*, viz. *Economical History of Sicily*, Naples, 1841.

M. P.

BIBLIA, FABRIZIO, of whose life nothing is known except that he was born at Catanzaro, and wrote in 1621, by order of the Viceroy Zapatta, during one of the most serious monetary crises of the time, a pamphlet having the title, *Discorso sopra l'aggiustamento della moneta e cambii nel Regno di Napoli*, in Napoli, 1621. He proves himself to be much inferior to Antonio Serra, who wrote in 1613 (see **A. SERRA**).

M. P.

BIDDLE, NICHOLAS, born 1786, died 1844; president of the Second Bank of the United States. A graduate of Princeton College, and later a student of law, he first became connected with the bank as a government director; was its president from 1823 to 1836, and a prominent figure through the eventful years of its unequal struggle with President Jackson. Biddle managed, on the whole with success, the affairs of this great institution, ramifying with its twenty-five branches through the United States. Most of his theories of banking were sound; but his theory as to bank-note issues was mischievous. Following the principle that guided the conduct of the Bank of England during the restriction, he believed there could be no excess of issues so long as the bank's advances were confined to good commercial paper, arising out of real transactions. He failed to distinguish between a bank-note proper, redeemable on demand at any branch in coin, and a draft, redeemable only at the branch on which it was drawn, and therefore practically irredeemable. Nearly all the difficulties of the bank can be traced to the vicious effects of this

principle. Biddle's theories on banking are to be found in the record of the actual operations of the bank under his management.

N. Biddle's writings are few; his best work was *Two letters to the Hon. J. Q. Adams; embodying History of the recharter of the Bank of the United States, and a view of the Present Condition of the Currency* (London, 1837). A. C. M.

BIEL, GABRIEL (1430?-1495), sometimes called the last of the scholastics, was born at Speyer about 1430. He enjoyed the esteem of the well-known Duke Eberhard of Württemberg, and was one of his chief agents in founding (1477) the university of Tübingen, in which he became professor of theology. He was afterwards a member of the order of the Brothers of the Common Life. His principal work is entitled *Collectorium Sententiarum*, published in 1501. He belongs to the history of political economy by the portion of this work in which he treats of money from the moral or casuistic point of view. Though inferior to ORESME, the other distinguished scholastic economist, in penetration and clearness of thought, he shows a sound understanding of the fundamental principles of the theory of money. This part of the work was published separately by John Virdung at Mainz in 1541 under the title, *De monetarum potestate simul et utilitate tractatus*. It is also appended to the treatise of Marquard Freher, *De re monetaria veterum Romanorum et hodierni apud Germanos imperii*, 1605. (Roscher, *Gesch. der Nat. Oekon. in Deutschland*, p. 21 seq.; and H. Contzen, *Gesch. der Volkswirtschaftlichen Lit. im Mittelalter*, p. 161).

J. K. I.

BIGELOW, ERASTUS BRIGHAM, LL.D., born 1814, died 1879, was an active and successful man of affairs, the inventor of many improvements in textile machinery, especially of the power-loom for weaving carpets. As an advocate of protection, and prominent woollen manufacturer, he had much influence in shaping the complicated system of duties on wool and woollens adopted by the United States in 1867. His writings on tariff subjects show force and ability. He wrote also pamphlets and review articles on the currency and on general economic questions.

Among his pamphlets may be mentioned *Remarks on the Depressed Condition of Manufactures in Massachusetts*, Boston, 1859, and *Address on the Wool Industry of the United States*, New York, 1869. F. W. T.

Bigelow was noted as a manufacturer in the textile arts. He early gave attention to industrial subjects, and in particular to the tariff question. His first printed treatise on the depressed state of American manufactures appeared in 1858. This was followed in 1862 by his best work, *The Tariff Question considered in regard to the Policy of England, and the interests of the United States*. With *Statistical*

and *Comparative Tables*, Boston, 1862, pp. 103. Appendix, pp. 242, quarto. The descriptive portion is largely historical, and is an attempt to show that the growth of English commerce was not due to free trade, but to other general causes, and that the removal of duties by England was no sacrifice. The statistical tables are valuable, and show a desire to bring together a great mass of data in a scientific way. The foregoing work is condensed and treated in a more popular form in *The Tariff Policy of England and of the United States contrasted*, Boston, 1877, pp. 61. Mr. Bigelow also published an *Address on the Wool Industry of the United States*, 1869; *Relations of Labour and Capital* (*Atlantic Monthly*, 1878). He was the first president of the National Association of Wool Manufacturers, organised in 1864; and had much to do in framing the tariff of 1867.

[See sketch of his life in *Bulletin of Nat. Assoc. of Wool Manuf.*, vol. ix. No. 4, 1879; also a brief memoir by Delano A. Goddard in *Proc. of Mass. Hist. Soc.*, Oct. 1882.] D. R. D.

BILL BROKING. Names do not always change with the things they describe. This is true of what is called "bill broking." When the business began early in this century the bill broker was really a broker—an agent between buyer and seller, procuring bills for the buyer, receiving a small commission for his trouble, but incurring no liability in respect of the transaction. The so-called "bill broker" is not now really a broker at all. Such business is still transacted, and on a considerable scale, but those known as bill brokers are really a sort of bankers, receiving from bankers and others large deposits which they invest for the most part in bills of exchange, agreeing to repay on demand or on short notice. They do also sell bills, but, as they guarantee the bills sold to the buyer, their liability remains intact just as much as if they held them till maturity. The bills are their own, and they do not get rid of the risk of holding them by selling them. Thus the character of the business has entirely changed. That change was no doubt gradual, and arose probably from the fact that bankers wanted to employ surplus money without the trouble and risk of selecting bills, and without the danger involved in locking up their funds in a security which could not at all times be readily turned into cash. Here a distinction must be made. So far we have referred to what is popularly called bill broking. But there is another large branch of the bill business which consists in the negotiation of bills drawn by British houses on firms abroad in payment for goods exported from these islands. In dealing with such bills, questions of EXCHANGE (q.v.) are all-important. The bills are drawn in the money of the country where payable, and they have to be turned into English money for

the convenience of the merchant who sells them. The bill broker makes his calculation as to the currency of the bill, the rate of exchange, and the contingencies of an exchange often altering, and names a price at which he buys the bill and takes all risks except that of non-payment. The amount of bills thus dealt in must be very large. But the bill broker proper has nothing to do with such bills. He is completely ignorant on all questions of exchange. The firms who deal in such bills are known as "foreign brokers," not as bill brokers. Leaving aside at present this special department of business in bills, there is really nothing peculiar in bill broking proper to distinguish it from banking on a great scale, except that a far larger proportion of the investments made by the bill broker must be made in bills of exchange for two reasons: (1) That he requires a large supply of bills of all dates to supply his customers who desire to purchase them, or to lend money on the deposit of bills as security, and (2) that, as he holds such large amounts payable at call or short notice, he requires a security which is perpetually revolving and coming to maturity as cash, and no known security answers this description so well as bills of exchange. He takes them daily of all dates, from a few days or weeks to run to six months, and they are perpetually falling in and supplying him with money.

It is a common observation that in banking no reserve is so good as a store of bills of exchange, and there is a constant demand for them on the part of banks, both in town and country, who cannot procure from their own customers a sufficient supply. It is one great part of the business of the bill broker to supply banks with this necessary aliment. The profit made on thus selling bills out and out is generally very small, but when once sold there is no further thought about the bill, if it is good; and the seller has the money in hand with which to make a fresh investment of the same kind. In this way a bill broker may turn over his "money" many times in a year, and in the aggregate obtain a fair return, though his liabilities on bills will be apparently enormous, but really very small, as the proportion of unpaid bills in a well-managed business is extremely slight. The history of the business seems, at first sight, to imply that the risks run are peculiarly heavy, so many of the old firms having disappeared through failure. As a bill depends entirely on names, and not on property, except occasionally where "document bills" are negotiated, it is obvious that much knowledge and experience are required in the choice of such paper. And even where there is a certainty of the ultimate payment of bills, there may be a great risk of having to wait long for payment, and in the meantime of a heavy lock-up of capital, a contingency which has often

caused much anxiety and embarrassment. So have passed away the great house of Overend, Gurney & Co., the house of Sanderson, Sandeman & Co., Bruce, Buxton & Co., and divers houses of smaller repute. Such cases illustrate the peculiar dangers of the business, but that it can be maintained with safety and success is abundantly proved by the history of some of the companies who have conducted it during the past thirty years, and of private concerns of old standing still remaining vigorous notwithstanding the severe competition which has arisen, to say nothing of smaller houses which have sprung up and flourished since 1866. Probably it may safely be said that, since that famous date, banking and bill broking have been conducted as a rule with more caution than during previous periods, and that the abuse of credit generally has been less rampant, so that mere adventurers have had far more difficulty than formerly in negotiating made-up (*i.e.* fictitious) bills.

In this connection it may be proper to note the prevailing impression that out of a given amount of business far less is done on bills, and far more by cash payments than was done, say thirty years ago. As to the fact, there seems no doubt when the figures as to inland bill stamps are considered. From these it is evident that with an enlarged business fewer bills are created.¹ Again it is said that the custom of obtaining loans from banks instead of accepting bills has much developed—that a man who owes money, instead of accepting for the amount, takes a loan from his bankers and pays cash. In this case there is credit, only in another and less visible form. A bill drawn and negotiated may pass into many hands, but the loan cannot be transferred, and remains a private affair between the banker and his customer.

In most cases there is an important advantage to the debtor in paying cash, and banks prefer loans within certain limits, because they can generally charge a higher rate on a loan than on the discount of a bill. Probably both creditor and debtor prefer this mode of settlement to the creation of bills, because not only are stamps saved, but the nature of their relations in business is not in any way divulged beyond the banker's room. Another important cause of the diminution of foreign bills, that is of bills drawn on London by traders residing in foreign countries, is the development of the system of TELEGRAPHIC TRANSFERS, by which very large sums are now paid without the creation

¹ It is not so easy to account for this change as to prove its existence. One cause, no doubt, is a great increase of the actual wealth of those engaged in the larger transactions of the country. Men who used to accept bills now pay cash, and procure important advantages thereby. This is observed in all parts of the country, and means of course that such traders have largely increased their cash resources, and so are enabled to dispense with CREDIT.

of a bill. Formerly, for instance, almost the whole of the enormous produce and credit business between America and England was effected by sixty days bills. Now, it is said that the amount of bills of this description is not one-third of what it formerly was. This alone would mean a great reduction in the aggregate of bills, and the same process is going on, more or less, as to the trade with the East, etc. So, from various causes, the creation of bills no longer keeps pace with the extension of business; and complaints are frequent that "bills are scarce," that "it is impossible to find bills enough for the demand," and so on, the result being that holders of bills often have the discount market under control; hence the bank minimum rate no longer guides the market during considerable periods, and the machinery of the money market is dislocated, the bank being compelled to have recourse to unusual and extraordinary means of reducing the supply of loanable capital in the market. It is perhaps worth noting here that while thirty years ago, the Bank of England was one of the largest holders of bills of exchange, it is now believed to be one of the smallest amongst the larger holders. This change arises from the enormous growth of the deposits of other banks, which deposits are largely invested in bills, and as these fall due, are re-invested in the same security, so that there arises a continual demand for bills, and a tendency to depression of rates of discount. It is difficult for the bank to counteract this tendency. The amounts in question are too large, and as deposits seem ever on the increase and bills are not increasing in proportion, we have seen in recent years longer periods of "cheap money" than have ever before been known in the history of our commerce.

Other interesting observations arise in reference to the comparison of our own practice as to bills and that of other countries of commercial importance.

Take the case of France. It is said that there is no trade in Paris in bills as there is in London. The Bank of France holds always a large amount of bills which she has discounted for customers, but of course they are held till maturity and are not dealt in. She, having branches all over France, is the great French collector of money. Moreover credit is not developed in France as with us, so that bills are not created in sufficient quantity to support a great trade in them. Bills are of necessity drawn from Paris on all parts of France, and they are said to be mostly held by the Bank of France, but the bill is not, as with us, the most important of all banking securities (see *BANK OF FRANCE*; *CLEARING HOUSE*).

Take again the United States. In Chicago, for instance, the great distributing houses do not generally draw on local centres for the amounts due to them by smaller traders. They

hold these as book debts which they collect as they can, in the meantime borrowing from banks for what they may themselves require. In England, on the contrary, such houses draw bills even for very small amounts which they discount in the market, thus avoiding a lock-up of capital. It cannot be said that credit is not fully developed in America, but in form it differs materially from our system. In some of the great eastern cities the custom is said to be different, and to resemble more that with which we are familiar, and in New York there is a limited market in bills, but not at all on the London scale. Banks buy bills and hold them, but there do not appear to be great houses collecting and dealing in bills after our fashion. Bill broking in fact may be said to be one of those British institutions which are peculiar to our country and arise from the peculiar nature of our commercial operations. It is a growth of that great expansion of credit which has so long distinguished our country, and to which we owe so much of our prosperity. The system is liable to much abuse, and has at times been grievously abused, but it is not, therefore, to be set down as mischievous and useless. It is one of those means of economising the use of loanable capital which are intrinsically valuable and important, and are therefore certain to survive criticism, however severe. W. F.

BILL OF EXCHANGE. The word bill, meaning generally a statement in writing, is derived from *bulle* (Lat.) Bills of exchange, which may be divided generally between "inland" and "foreign," those which take their origin in transactions in one country only, and those which arise from transactions beyond the limits of that country in which they are payable, are among the most important of *COMMERCIAL INSTRUMENTS* (*q.v.*) Bills, properly speaking, represent debts, they may be used, by negotiation, to transfer these debts from one person to another, and first-class bills form one of the best securities which a banker can hold (see *BILL BROKING*). They sometimes, however, are drawn without being based on any genuine transactions; in this case their standing is more doubtful (see *ACCOMMODATION BILL*; *CROSS DRAWING*; *KITE*). Foreign bills sometimes originate in exchange operations, and are hence often employed in connection with the financial liabilities of governments. The amount of the bills of exchange in existence at one time in the United Kingdom is very large. It was estimated by W. Leatham (*Letters to Sir C. Wood*, 2d ed. p. 13), as being £135,000,000 in 1841, by W. Newmarch as not much less than £180,000,000 or probably £200,000,000 in 1856 (Tooke and NEWMARCH, *History of Prices*, vol. vi. p. 588), by R. H. Inglis Palgrave, as being from £300,000,000 to £350,000,000 in 1872 (*Notes on Banking*, p. 36). The amount is probably not larger now (1891).

There are some varieties in form according as bills are drawn in England on persons residing in foreign countries or otherwise. A very usual one is as follows:

Due 3d March 1891.

£500.

LIVERPOOL, 31st Jan. 1891.

One month after date pay to us, or order,
Five Hundred Pounds value received in goods,
as per invoice dated 25.1.91. A. B. & Co.

Messrs. C. D & Co.

415 Mincing Lane,
London, E.C.

[For further details see books named above, and Goschen's *Foreign Exchanges*, in which foreign bills especially are treated of.]

BILL OF EXCHANGE, LAW OF. The law relating to bills, notes, and cheques, differs from other branches of our mercantile law in two respects. First, it has been codified by the Bills of Exchange Act 1882 (45 & 46 Vict. c. 61), and secondly, the act in question applies to the whole of the United Kingdom; so that with the exception of two Scotch rules which are specially preserved, there is now a practically uniform body of rules for England, Scotland, and Ireland.

By § 3 of the act a bill of exchange is defined as "an unconditional order in writing, addressed by one person to another, signed by the person giving it, requiring the person to whom it is addressed to pay on demand or at a fixed or determinable future time a sum certain in money to, or to the order of, a specified person or to bearer." The person who gives the order is called the **DRAWER**, the person thereby ordered to pay is called the drawee, and if he signifies his assent to the order in due form he is then called the **ACCEPTOR**. An acceptance must be in writing on the bill and be signed by the drawee (§ 17). When a bill is payable to a person named or to his order, it may be transferred by his endorsement. The person to whom it is so transferred is called the endorsee. The term "holder" includes alike the bearer of a bill payable to bearer, an original payee, and an endorsee.

Bills of exchange are said to have originated with the Florentines in the 12th century. From Italy their use spread to France, and from thence to England, and throughout the commercial world generally. A bill of exchange in its origin was an instrument by which a trade debt due in one place was transferred in another, thereby avoiding the necessity of transmitting cash from place to place. But in England mercantile usage adopted into law by judicial decisions has enlarged the original idea, and has created, by means of bills and notes, a perfectly flexible paper currency. Perhaps the full force of the English definition cited above is best brought out by contrasting

it with some foreign system. French law, which adheres rigidly to the original theory of the uses of bills, offers the best contrast. In France a bill represents a trade transaction, in England it is merely an instrument of credit. English law gives full play to the system of accommodation paper (see **ACCOMMODATION BILL**); French law endeavours to stamp it out. Thus in England it is not necessary to express on the face of a bill that value has been given, for the law raises a presumption to that effect. In France the nature of the value given must be expressed, and a false statement of value voids the bill in the hands of all parties with notice. In England a bill may be drawn and payable in the same place. According to French law, though the rule is said of recent years to be disregarded in practice, the place where a bill is drawn must be so far distant from the place where it is payable that there may be a possible rate of exchange between the two. A false statement of places so as to evade this rule voids the bill in the hands of parties with notice. As the French lawyers put it, a bill of exchange necessarily presupposes a contract of exchange. In England a bill may be drawn payable to bearer. In France it must be drawn payable to order; if it were not so the rule requiring the consideration to be expressed would be a nullity. In England a bill payable to order becomes payable to bearer when endorsed in blank. In France an endorsement in blank merely operates as a procuration. In England if a bill be refused acceptance, a right of action against the drawer and endorsers at once accrues to the holder. This is the logical consequence of the currency theory. In France no cause of action arises unless the bill is again dishonoured at maturity; the holder in the meantime is only entitled to demand security from the drawer and endorsers. In England a sharp distinction is drawn between current and overdue bills. A person who becomes the holder of a bill after its maturity, acquires and can give no better title to it than the person from whom he took it had. In France no such distinction appears to be drawn (see Chalmers on *Bills of Exchange*, ed 3, *Introd.*, pp. xlv.-xlvii.)

In some foreign countries any creditor is entitled to draw on his debtor for the amount of his debt, but in England the right to draw arises only from special agreement. A reason for the English rule may perhaps be found in the fact that at common law, apart from special agreement, it is the duty of the debtor to seek out his creditor, as soon as the debt is due, and to tender the money to him.

Bills of exchange payable on demand may be stamped with either impressed or adhesive stamps, the stamp duty being one penny. Foreign notes and bills must of course be stamped with adhesive stamps. Inland notes of all kinds, and inland bills payable otherwise

than on demand, must be drawn on impressed stamps. All notes and bills, other than bills payable on demand, are subject to an *ad valorem* stamp duty (Stamp Act 1870, §§ 45-55 and Schedule). Section 72 of the Bills of Exchange Act provides that when a bill or note is issued out of the United Kingdom it is not to be impeached because it is not stamped in accordance with the law of the place of issue. This affirms a general rule that the courts of one country take no cognisance of the revenue laws of another country. The enactment is clearly a fair one, as the present stamp act requires bills issued abroad to be stamped here, and makes no allowance for the foreign stamp.

The acceptor is the party primarily liable on a bill. By accepting it he "engages that he will pay it according to the tenor of his acceptance" (§ 54). The holder is entitled to require an absolute acceptance, but if the drawee will only give a qualified or conditional acceptance, the holder may either treat this as a refusal to accept, or at his peril take the qualified acceptance (§§ 19, 44).

The drawer of a bill is in the nature of a surety for the acceptor. He "engages that on due presentment it shall be accepted and paid according to its tenor, and that if it be dishonoured he will compensate the holder or any endorser who is compelled to pay it, provided that the requisite proceedings on dishonour be duly taken" (§ 55). The endorser of a bill is in the nature of a new drawer, and his obligations to subsequent parties resemble those of the drawer. When a bill is dishonoured the holder must, subject to certain specified exceptions (§ 50), give notice of dishonour to the drawer and endorsers he wishes to charge, and if the bill be a foreign bill he must also protest it. An inland bill may be noted, but no legal consequences attach to this proceeding, except the right to recover the noting expenses. When the liabilities of the drawer and endorsers are fixed by taking the proper proceedings on dishonour, the holder may either sue all the parties to the bill concurrently, or he may sue them in succession until he has recovered the amount of the bill with his damages and costs.

Sometimes, when it is doubtful whether the drawee will accept or whether he will be in a position to pay when the bill matures, the bill specifies some other person to whom the holder may resort in case of need. This person is called the "besoin" or "case of need." If he accepts the bill he is called an "acceptor for honour," and if he pays it he is called a "payer for honour." He must not pay the bill till it has been duly noted or protested for non-payment by the original drawee. On payment he becomes entitled to exercise the rights of the holder as against the party for whose honour he paid and all parties antecedent to him (§§ 65-68).

Comparing bills of exchange with other contracts, it will appear that the majority of the peculiar rules relating to them are deducible from the fact of their negotiability. A contract or chose in action is not assignable at common law, though in equity the benefit of it might be assigned subject to all equities between the parties. But a bill of exchange is part of the mercantile currency of the country, and its primary object is that it should circulate freely from hand to hand and that every honest holder should be able to deal with it like cash. A bill payable to order may be negotiated by the endorsement of the holder, completed by delivery. A bill payable to bearer, or endorsed in blank, may be negotiated by mere delivery. The consideration for its issue, acceptance, and negotiation is presumed until the contrary is shown or a *prima facie* case of fraud is made out, in which case the onus of proof is shifted (§ 30). If a bill gets into the hands of a "holder in due course" (§ 29), he gets an absolute title, and no antecedent fraud other than forgery affects him (§ 38). So strong is this rule in English law that if a person puts a blank signature on stamp paper, it is treated as an authority to any person to whom the paper is delivered to fill it up as a bill for any amount the stamp will cover, and if the bill, when complete, gets into the hands of a holder for value without notice, no objection that the paper was improperly dealt with is allowed to prevail (§ 20). The laws of all countries agree in the rule that no title can be made to a bill through a forged signature, but English law is peculiarly severe on the party who pays the bill (§ 24). Except in the case of a demand draft drawn on a banker (§ 60) the person who pays a bill pays it at his peril if the party presenting it claims under a forged endorsement. Thus if the drawee of a bill accepts it, payable at his bankers, after a forged endorsement has been placed on it, the bankers cannot debit his account with the amount of such payment. Under the continental codes, a banker who paid such a bill without any notice of the fraud would be protested.

A further peculiarity of English law is the compulsory allowance of three days of grace on all bills payable otherwise than on demand (§ 14). It is believed that all the continental codes now agree in abolishing this fictitious maturity for bills, but the holder is generally entitled to wait one or two days before the bill is protested.

From the references to foreign law already made, it appears that the practice of the mercantile world, with reference to bills of exchange, is by no means uniform. Rules, therefore, are required for regulating this conflict of laws, and they are provided by § 72 of the act, their guiding principle being the maxim "*locus regit actum.*"

A PROMISSORY NOTE is defined by § 83 of the Act to be "an unconditional promise in writing made by one person to another, signed by the maker, engaging to pay on demand or at a fixed or determinable future time a sum certain in money to, or to the order of, a specified person or to bearer." There are various statutory restrictions on the issue of promissory notes payable to bearer on demand for less than £5, and there are further restrictions on the issue by bankers of either bills or notes for any amount payable to bearer on demand. When a promissory note is made by two or three makers, they are liable, either jointly or jointly and severally, according to the tenor of the instrument (§ 85). In this a note differs from a bill, because if a bill be accepted by two or more drawees, they are only liable jointly and not jointly and severally. But for the most part the provisions of the act with reference to bills of exchange apply, with the necessary modifications, to promissory notes. In applying those provisions, the maker of a note is deemed to correspond with the acceptor of a bill, and the first indorser of a note is deemed to correspond with the drawer of an accepted bill payable to drawer's order (§ 89). The provisions of the act relating to presentment for acceptance, acceptance, acceptance *supra* protest, and bills in a set have no application to notes. Moreover, protest of a foreign note is unnecessary for English purposes (*ibid.*)

As to the economic operation of bills and notes as instruments of credit, see articles on BILL OF EXCHANGE, CREDIT, CROSS DRAWING, Goschen's *Foreign Exchanges* and Mill's *Political Economy*, bk. ii. c. xi. and xii. As to the English law on the subject, see Byles on *Bills of Exchange*, Chalmers on *Bills of Exchange*, and Chitty on *Bills of Exchange*. As to American law, see Story on *Bills of Exchange*, Parson's *Law of Notes and Bills*, and Daniell on *Negotiable Instruments*. The French law on the subject is fully treated of in M. Nougier's *Lettres de Change et Effets de Commerce*, ed. 4 (1875), which also summarises the provisions of the various continental codes. The Indian law on the subject is contained in the Indian Negotiable Instruments Act 1881, as amended by Act II. of 1885, and it may be noted that Canada and some of the Australian colonies have recently adopted the English Bills of Exchange Act.

M. D. C.

BILL OF LADING. A document by which the master or some other agent of the shipowner on his behalf acknowledges the receipt of certain goods, and undertakes to deliver them to the consignee at the port of destination, against the payment of freight and subject to certain contingencies releasing him from liability. The consignee is either named in the bill of lading, or it is simply stated that the goods are to be delivered to the order of the shipper, in which case the goods are delivered to the person to

whom the document is indorsed, or to a subsequent indorsee. If the bill of lading is made out to the consignee or his order, the goods are delivered either to the consignee or an indorsee, but if the consignee is named without any additional words he is the only person who has a legal right to the delivery of the goods. As a general rule an indorsee acquires the property in the goods as soon as a properly indorsed bill of lading is handed over to him with that intention, but this rule is subject to several exceptions, the most important one being the so-called right of stoppage *in transitu*, which enables an unpaid seller to stop the delivery of the goods if the buyer has become insolvent before they came into his power. If, however, the buyer has in the meantime transferred the bill of lading to a *bona fide* holder for valuable consideration, the right is no longer available. It must also be mentioned that a bill of lading is not negotiable in the same sense as a cheque or a properly indorsed bill of exchange. A person who in good faith gives value for a stolen current bill of exchange indorsed in blank, or for a cheque to bearer, acquires a good title, though the thief from whom he bought it had none. This is not the case with regard to a bill of lading, as a subsequent holder of a document of this nature cannot (except in so far as he is not affected by the right of stoppage *in transitu*) acquire a better title than a previous holder had. In former times the contractual rights and liabilities arising from a bill of lading (*e.g.* the right to sue in case of loss) remained with the original parties, notwithstanding the transfer of the property in the goods, but the statute 18 & 19 Vict. c. 111 enacts that "every consignee of goods named in a bill of lading and every indorsee of a bill of lading to whom the property in the goods therein mentioned shall pass upon or by reason of such consignment or indorsement, shall have transferred to and vested in him all rights of suit, and be subject to the same liabilities in respect of such goods as if the contract contained in the bill of lading had been made with himself." Bills of lading are generally made out in sets of several identical copies, which are forwarded by different mails, so that one may serve in case of the loss of another. The system is not free from danger, as a fraudulent holder may negotiate each copy separately. Occurrences of this sort have happened on more than one occasion, and have caused a considerable amount of litigation.

E. S.

BILL OF SALE. A document purporting to assign the property in personal chattels remaining in the possession of the assignor. Assignments of this nature as a general rule are not made for the purpose of a regular sale, but merely by way of security for a loan. A bill of sale is void as against execution creditors, if it is not drawn up in the statutory form and

registered in the central office of the High Court within seven days of the date of issue; it must also be renewed every five years. A charge of personal chattels in a debenture need not be registered as a bill of sale. The acts of parliament now regulating the law of bills of sale are those of 1878 and 1882 (41 & 42 Vict. c. 31; 45 & 46 Vict. c. 43). A bill of sale given by way of security for the payment of a sum under £30 is void. E. S.

BILLON. This conventional term, French rather than English, is derived from a corruption of the low-Latin word *billio*, or *bullio*, from which springs the English word bullion. In French mint language it has certainly, from the 13th century, if not before, signified the degeneracy of the pure contents of a coin through an alloy, generally silver in the gold pieces, or copper or lead in the silver pieces, giving them a particular degree of impurity, and thus debasing their intrinsic value. In the old French coinage, down to the monetary reform in the first revolution, the silver marc of a given weight was imagined as divided into twelve parts called *deniers d'alloy*, eleven of them pure silver and one alloy. This mixture was silver of $\frac{11}{12}$, or, in decimals, of .9166 fine, and was the old standard. This was altered to $\frac{9}{10}$, or, in decimals, to .900 fine, from 1804 to the present time. All degrees of fineness below it, or below the standard at the time being, were considered as changing the coin to billon.

That designation is also largely applied by numismatists to ancient silver coins, and notably to those of the Roman and Greek series, when these are materially below what ought to be the average standard fineness of the metal, according to the scales laid down at the best periods for purity of the silver coinage, and it is even extended by them to what are really false coins (although struck by state or other ruling authority) of copper, or of brass, plated or washed over with silver, and passed with forced currency as silver coins. Thus the term is made to cover a wide range of meaning, varying from a comparatively small degree of degradation in fineness down to the merest pretence of having any actual intrinsic value of precious metal in the composition of such coins.

It is noticeable that the term billon has not been applied in France without some exceptions in the case of gold below the standard. It was so applied in the Middle Ages, but, in the time of Louis XIV., when under twelve carats out of the twenty-four carats were of pure gold, the alloy was called "silver holding gold," or, if the proportion of copper to gold was of like amount, the alloy was called "copper holding gold." The term billon has also been generally used in France for all copper or bronze money, even when it is of full weight according to mint indentures. In some points of view this appears contradictory, but the use of the word

is probably intended to convey the meaning of a token coinage, the intrinsic value being so largely below the nominal one. Whilst the full-weighted five-franc silver pieces of France, Italy, Belgium, Switzerland, and other states which are allies in the now subsisting Latin monetary union, continue to be coined $\frac{1}{10}$ or .900 fine, their 2 franc, 1 franc, and $\frac{1}{2}$ franc pieces are still coined .835 fine, or just on the borderland which divided silver of the old standard from billon. But in England our coinage of crowns, four shillings, half-crowns, florins, shillings, sixpences, and threepences, is struck of a higher degree of fineness, namely, .925. In the general result it would seem that, as standards vary in different countries, what is locally billon in any one of them need not necessarily be so in others, and that such a variation prevents any precise general international agreement as to what the word exactly signifies at different places or times (see **BULLION**).

F. H.

BI-METALLISM. This compound word is used to describe the employment of two metals, to form at the same time, in combination with each other, the standard of value. The final report of the Royal Commission on Gold and Silver describes bi-metallism as follows: "A bi-metallic system of currency to be completely effective must, in the view of those who advocate it, include two essential features: (a) An open mint ready to coin any quantity of either gold or silver which may be brought to it. (b) The right on the part of a debtor to discharge his liabilities, at his option, in either of the two metals, at a ratio fixed by law." It is usually understood now to mean that the two metals are used thus at a fixed proportion to each other, as in the countries forming the **LATIN UNION** (*q.v.*), in which the ratio of 1 gold to 15½ silver by weight forms the legal basis, or in the United States in which the ratio is 1 to 16. Few economic subjects have of recent years been discussed with more heat, owing partly to the fact that some on the one hand have considered that the adoption, or the retention, of bi-metallism would confer certain advantages on particular classes, and that some on the other hand think that **MONO-METALLISM** profits other classes.

The main requisite in a standard is, that it should be, as nearly as possible, constant in its purchasing power. The selection, or the construction, of a stable standard of value is, however, even more difficult than that of an undeviating standard of time. In this connection it is advisable, while considering here the possible employment of two metals for this purpose, to quote the words of John Locke on the advantage of employing one metal only,—as this quotation sets forth the drawbacks to bi-metallism without any reference to recent controversy,—bearing in mind the circumstance that at the date when Locke wrote international bi-metal-

lism had never been thought of. "Two metals, as gold and silver, cannot be the measure of commerce both together in any country; because the measure of commerce must be perpetually the same, invariable, and keeping the same proportion of value in all its parts" (*Further Considerations concerning raising the Value of Money*, John Locke). On the principle thus expressed the STANDARD OF VALUE, understood in the sense of the measure provided by the government, through their engagement to coin at a fixed rate the metal brought to them for the purpose, has been based in this country by legal enactment since 1798, in practice nearly since the commencement of the 18th century, though a double standard remained legal till the date mentioned. Gold became the general medium of circulation in this country either through choice or, what seems the more probable, through the differing ratio of value in foreign countries which made silver the best export. In 1798, shortly after the suspension of cash payments (1797), the government suspended the coinage of silver. Up to 1783 every man might make his payments in silver or gold at his option; though after 1774 he could only pay in silver up to £25 "by tale," but "by weight" up to any amount. There was no restriction as to payments in gold. The general practice of the country before the restriction was confirmed by the distinct adoption of a gold mono-metallic basis on the resumption of specie payments in 1816. Silver was, however, allowed to be held as part of the reserve of the precious metals against which the notes of the Bank of England are allowed to be issued by the 3d clause of the act of 1844 (see BANK NOTE, BANK OF ENGLAND), which permits the bank to retain in the issue department silver bullion to an amount not "exceeding one-fourth part of the gold coin and bullion at such time held by the Bank of England in the issue department." Silver bullion was accordingly held by the issue department up to large amounts (the average for the year 1846 was £2,169,000; see *Bank Rate in England, France, and Germany*, 1844-78, Palgrave), but the practice was discontinued in 1853, and has never since been resumed. While this country became mono-metallic, in France a standard fixed at the rate of 1 mark of gold to 15½ of silver was definitely established in 1785, and continued by the law of 1803, gold and silver, in 5-franc pieces, being equally legal tender for any amount. The Latin Union, as the coinage treaty of 1865 was called, which included France, Belgium, Switzerland, Italy, Greece, and Roumania, carried on its mintage operations on the same basis as in France till 1874, after which date the coinage of silver was restricted and practically suspended. A considerable drop in the market price of silver followed. From having been 4s. 11½d. an oz. in 1844 it sank to 3s. 6d. both in

1886 and in 1889, and a further drop has taken place since. The results of this alteration have been widespread, the effect being particularly seen on the rate of exchange between countries with a gold and those maintaining a silver standard; and less distinctly on prices of commodities in general within the countries concerned. Much discussion has hence ensued. It may, however, be observed that a real mono-metallicism had not existed in Europe till 1873, as the existence of the Latin Union counterbalanced its effects both in gold and silver using countries. The question has been treated with great scientific power by Professor JEVONS, who explains in his book on *Money* "that a *compensatory*, or as I should prefer to call it, *equilibratory action*, goes on under the French currency law, and tends to maintain both gold and silver more steady in value than they would otherwise be." He points out that when one metal becomes more sought for than the other there is an inevitable tendency to import the cheaper and export the dearer, and continues: "At any moment the standard of value is doubtless one metal or the other, and not both; yet the fact that there is an alternation tends to make each vary much less than it would otherwise do. It cannot prevent both metals from falling or rising in value compared with other commodities, but it can throw variations of supply and demand over a larger area, instead of leaving each metal to be affected merely by its own accidents. Imagine two reservoirs of water, each subject to independent variations of supply and demand. In the absence of any connecting pipe, the level of the water in each reservoir will be subject to its own fluctuations only. But if we open a connection, the water in both will assume a certain level, and the effects of any excessive supply or demand will be distributed over the whole area of both reservoirs. The mass of the metals, gold and silver, circulating in Western Europe in late years, is exactly represented by the water in these reservoirs, and the connecting pipe is the law of the 7th Germinal, An. xi. (1803) which enables one metal to take the place of the other as an unlimited legal tender." The theory on which bi-metallicism rests is completely explained in these observations of Jevons. With respect, however, to the advisability of a nation adopting a single or a double standard, Jevons expresses himself in cautious terms, adding (*Money*, p. 141), "The question seems to be entirely one of degree, and in the absence of precise information is quite indeterminate."

The final report of the Royal Commission on Gold and Silver, 1888, expresses a decided opinion that the bi-metallic system of the Latin Union exerted a material influence upon the relative value of the two metals (par. 193): "So long as that system was in force we think that, notwithstanding the changes in the pro-

duction and use of the precious metals, it kept the market-price of silver approximately steady at the ratio fixed by law between them, namely, $15\frac{1}{2}$ to 1." With respect to the position of the metals in two countries, in one of which silver, while in the other gold, is employed, we may quote from an article in the *Economist* of 2d February 1878, which observes that the "relative value, the proportions in which the two metals will exchange for each other, are continually fluctuating, and they must inevitably do so unless it were possible to fetter the supply in such a manner that only the right proportions of each metal should be brought to market at the same time. Two articles, of course, cannot remain always at the same relative value to each other unless the production of both is maintained at the same proportion, and no excess or diminution of the supply exists. Nor can they do so unless they are of identical utility, and are capable of performing identical services to man. When two commodities perform exactly the same functions, and are equally capable of doing so, being equally desirable in every respect, they will continually tend to exchange for other things in the same proportions. But this cannot be said to describe the exact relations of gold and silver to each other." The results of the export of the one and the import of the other metal are then referred to: "The loss arising from these causes may not come home to the inhabitants of the country where it occurs in a clear and obvious way. The inhabitants may, if silver is cheap and gold is wanted for export, retain silver for their own domestic use and employ it in their circulation till a fluctuation in the exchanges renders it possible for the gold to return. The banks which make the remittances will, in this case, obtain a profit from the transaction, while the people who employ the money will hold over the currency they receive in the ordinary way of trade till the tide sets in the contrary direction. Thus the loss which the country really experiences from employing a currency which is depreciated, as compared with the currency of other countries employing a more valuable standard, will be veiled from view, though it really exists." One metal out of the two is taken in this case for export because it is profitable to the exporter to send it rather than the other, but it would not be sent unless its export were advantageous. As the risks to any single country which employs bi-metallism are obvious, the advocates of the system recommend that all countries should employ it, as this would, they consider, prevent a preferential movement of either metal from one country to another. Thus the work recently published by Sir D. Barbour, *The Theory of Bi-metallism*, recommends "the adoption of universal bi-metallism at a fixed ratio to be determined by mutual consent." "Failing universal bi-metallism," Sir D. Barbour continues, it would

be desirable that bi-metallism should be adopted by a group of countries sufficiently strong to maintain the fixed ratio," Sir D. Barbour's contention being "that the existence of this fixed ratio for the purposes of the currency will control and regulate the market price of the two metals so as to prevent it from varying in any material degree from the fixed legal ratio of the currency."

Rochussen is of the same opinion. Quoting the words of a Belgian writer in the *Revue Générale*, October 1887, p. 653, "'Si le kilogramme d'or vaut actuellement sur le marché vingt kilogrammes d'argent, c'est apparemment que le kilogramme d'or, pour être extrait de la terre, coûte autant qu'il en coûte d'extraire vingt kilogrammes d'argent,'" he comments on them thus—"Apparemment! No explanation of the market price can be more in conflict than this is with all the facts of mining industry, and all the principles of money. In the first twenty years of this century the production of gold stood in comparison to that of silver (valued at 1 to $15\frac{1}{2}$) as $2\frac{2}{3}$ to 8. In the following period of twenty years, nearly as 4 to 8; thereafter from 1841 to 1850 as 8 to 8; from 1851 to 1860, very nearly 28 to 8; in the following five years, as 23 to 8; and from that time onwards to 1870 the proportion fell to 18 to 8, showing even at that rate an increase of some 675 per cent in the proportion. Yet in all this time there was no greater change in the market price, now of one metal, now of the other, than about 2 per cent.

"Or if we choose to look rather at the facts which concern the demand, than at those which concern the supply (*aanbod*), we shall see that the steadiness of price was not affected, though the demand for gold was greatest when the supply was least, and the demand for silver was greatest when the supply of that metal was least." (Rochussen, *Geld- en Muntwezen*, p. 287.)¹

The statement given above shows the main features of the working of a bi-metallic system. Jevons remarks (see Letter from Jevons to M. WOŁOWSKI, printed in Jevons's *Investigations in Currency and Finance*, p. 304) that the French currency law has "no doubt assisted to keep gold and silver at a nearly invariable price as compared one with the other." As mentioned previously, the Gold and Silver Commission un-animously concurred in supporting the same opinion. Jevons also observes that "it is indispensable to remember the fact, too much overlooked by disputants, that the values of gold and silver are ultimately governed, like

¹ M. Rochussen held the position of minister for foreign affairs in Holland 1879 and 1880, and is at the present time (1890) a member of the council of state. His father, it may be mentioned, was minister for the colonies,—also for seven years governor-general of Dutch India, and twice minister of finance. The circumstances of Holland give those engaged in its administrations very considerable opportunities for watching the fluctuations of the standard of value.

those of all other commodities, by the cost of production. Unless clear reasons, then, can be shown why silver should be more constant in its circumstances of production than gold, there is no ground for thinking that a bi-metallic gold and silver money will afford a more steady standard of value than gold alone" (Jevons, *Investigations in Currency and Finance*, p. 318). "Ultimately" is the governing word in this quotation, and is frequently overlooked; it may mean an almost indefinite period. The reader must be referred to the works of Jevons here cited for the whole of his arguments; it is hardly possible to express them fully by any selection.

As a matter of history it appears that the value of silver relatively to gold has tended to diminish as ages have passed by. Meanwhile France and the Latin Union, after trying the experiment of an international bi-metallism on a very considerable scale, have abandoned, or at least suspended the free coinage of both metals at a fixed ratio. The United States, after employing a bi-metallic ratio of 1:15·25 in 1786, changed to 1:15 in 1792, to 1:16·002 in 1834, to 1:15·988 in 1837, and adopted the gold dollar only as the UNIT OF VALUE in 1873. A limited coinage of silver dollars was directed in 1878 (by the Allison or Bland Act), which possess "full paying power, except in cases where it is strictly stipulated otherwise in the contract." A somewhat limited system of bi-metallism was thus in force in the United States from 1878 to 1890. In 1890 an act authorising a great extension of the coinage of silver was passed by the legislature (see BLAND ACT; SILVER LEGISLATION IN THE UNITED STATES). The question of the advisability of adopting a bi-metallic standard has been discussed by many writers recently, but by none in so dispassionate a manner as by Jevons, who observes, "It may be safely said that the question of bi-metallism is one which does not admit of any precise and simple answer. It is essentially an indeterminate problem. It involves several variable quantities and many constant quantities, the latter being either inaccurately known or, in many cases, altogether unknown. The present annual supplies of gold and silver are ascertained with fair approach to certainty, but the future supplies are matter of doubt. This demand for the metals again involves wholly unknown quantities, depending partly upon the course of trade, but partly also upon the action of foreign peoples and governments, about which we can only form surmises" (Jevons, *Investigations in Currency and Finance*, p. 317). The use of both gold and silver as standards of value is obviously most important, and it equally cannot be doubted that the disuse of either must lead, as the disuse of silver has recently done, to considerable fluctuations in the prices of commodities. To recommend, however, a

country which is now mono-metallic to become bi-metallic, or a corresponding change on the part of a bi-metallic country, requires a far more complete inquiry than has yet been made. The theory may be explained in comparatively few words, but for any adequate statement of the practical results the reader must be referred to the following works, which are far, however, from exhausting the subject.

[*Bibliography.*—The following list is derived in part from the one at the end of Prof. W. S. Jevons's *Investigations in Currency and Finance*, and that in Appendix to *Proceedings, etc., of the International Monetary Conference of 1878*, drawn up by Mr. Dana Horton. The reader is referred to these lists for fuller information. The literature on the subject is very extensive, to a great extent in articles and letters in newspapers and other periodicals. The arguments on the subject will be found stated in Jevons, *Investigations in Currency and Finance*, London, 1884.—*Money and the Mechanism of Exchange*, 1875, also by Jevons.—*Reports of Committee of House of Commons on Depreciation of Silver*, 1878.—*Report of Commission on Trade and Industry*, 1886, and Appendix B to 3d Report, by R. H. Inglis Palgrave.—*Report of Commission on Gold and Silver*, 1887.—Sir D. Barbour, *Theory of Bi-metallism*, London, 1885.—S. F. Rœdussen, La Haye, 1891.—*Le Problème Monétaire et sa solution par G. M. Boissereau*, Paris and Amsterdam, 1891, translated by G. T. Warner. *The Monetary Question*, London, 1891.—Also *Journals of Statistical Society*, London, *Institute of Bankers*, London, *Economist*, London, *Economiste Français*, Paris, *passim*; many detached articles and pamphlets by W. Bagehot, P. Leroy Beaulieu, O. Haupt, Prof. H. Sidgwick, Mr. R. Giffen, etc. The number of writings on this subject has, in general, restricted the reference given above to one of the works of the authors named.]

BIRTH-RATE means generally the ratio which the number of births per annum bears to the number of persons in the population under consideration. The rate thus defined depends largely on another rate which has been called *fecundity*, and has been defined as the ratio which the number of births per annum bears to the number of persons of reproductive age, or of women of reproductive age (say 15-45); or of married persons, or wives only, of that age (see Bertillon, "Mouvement de la Population" in *Annales de Démographie*, vol. i.; also Quetelet, *Physique Sociale*, bk. ii. § 6). Some of these relations are illustrated by the accompanying table which shows the average annual births per 1000 in the kingdom of Bavaria (1871-1872). It is taken from Mayr's *Die Gesetzmässigkeit in Gesellschaftsleben*, p. 244. (Decimals have been omitted.)

Legitimate births per 1000 wives between ages 15-45.	Illegitimate births per 1000 unmarried women between ages 15-45.	Legitimate and illegitimate births per 1000 women between ages 15-45.	Legitimate and illegitimate births per 1000 of the general population, men and women of all ages.
368	45	182	41

Fixing attention on legitimate births, we may regard the birth-rate as depending chiefly on two factors: (a) the ratio which the number of married persons of reproductive age bears to the general population, and (b) the ratio which the number of births per annum bears to the number of married persons of reproductive age. The first factor (a) varies with the number of newly married persons; this varies with prosperity, which (in many countries) varies with the price of bread. Accordingly it has often been observed that bad harvests are followed by a decline in the birth-rate and *vice versa*. Thus the year 1817, in which the price of corn in Belgium rose to twice the average of the neigh-

bouring years, was followed by a great decrease of births. Other instances are referred to by Quetelet (*Physique Sociale*, bk. ii. § 6) and Hauschalter (*Lehr- und Handbuch der Statistik*). The Swedish statistics, extending over more than a century, have been arranged in such a way as to bring out the connection between good or bad harvests with many or few marriages and births (see *Journal of the Statistical Society*, 1862, vol. xxv., p. 140, "Vital Statistics of Sweden," by Mr. Hendriks' Table A; *ib.* 1885, opening address of Sir Rawson Rawson, p. 586). When several good or several bad harvests come together the effect is conspicuous in the case of Sweden. But this law is not universal. It cannot be traced in the case of the United Kingdom of late years (see *Journ. Stat. Soc.*, 1890, p. 257 *et seq.*) and in other cases where the price wheat is not the main factor of prosperity. (b) The fecundity of marriages depends partly on the age of the parties. This subject has been discussed by Dr. Ogle (*Journ. Stat. Soc.*, 1890, p. 275), who shows that, to cause a sensible alteration in the birth-rate, a very considerable displacement of ages would be required. That other causes beside age are operative is evidenced by the fact that in France and New England the age of marriage is not remarkably late, while the fecundity is remarkably small (see the table at the end of this article). Among causes which may affect the fecundity of marriages are *climate* and *food*. These and other causes are discussed by many of the authorities cited here.

As to the consequences of variations in the birth-rate the most obvious is the tendency of population to increase more rapidly when the birth-rate is high (and *vice versa*). But this tendency may be counteracted by a high death-rate. That a high birth-rate is not a consequence of a high death-rate, though to some extent causally connected therewith, is maintained by Dr. Noel Humphreys in the *Journal of the Statistical Society*, 1874. The two phenomena frequently co-exist. Thus the statistics of the Austrian empire compiled by Hain (*Statistik des Österreichischen Kaiserthums*, 1852-3) exhibit birth-rates, marriage-rates, and death-rates varying concurrently. Moving through the provinces along a line in a south-easterly direction you would find the three factors constantly increasing together. The increase of the population (the natural increment, abstracting the effects of emigration and immigration), is therefore not in general proportionate to the birth-rate. Thus the birth-rate of Russia for the period 1865-1883, viz. 4.94 per 100 living, was much greater than the birth-rate for England and Wales, viz. 3.51; yet the annual excess of births over deaths per cent of the whole population was the same for the two countries, viz. 1.37 (see table subjoined). The natural increment for England

and Wales for 1871-1881 was greater than that of the previous decade by about 10 per cent (of the natural increment); while the birth-rate increased very slightly, by about .3 per cent (census for 1881 general report). There is reason to think that the state of a country in which a high birth-rate is matched by a high death-rate is not satisfactory.

See in addition to the authorities cited Prof. Marshall, *Principles of Economics*, bk. iv. ch. iv. Some examples of the statistics quoted by him are here subjoined.

Averages for the years 1865 to 1883.
(With a few exceptions.)

BIUNDI, G. Known as the author of a treatise on political economy; *La economia esposta nei suoi principii ragionati e dedotti*, Milano, Maisner and comp., 1864.

Author besides of the following works and articles:—"Dell' influenza che esercitano le private nell' industria," published in the review *Empedocle*, Palermo, 1853, vol. iv. fasc. 7-10, p. 324.—"Sul credito agricolo e sull' istituzione d' una banca territoriale in Sicilia," Palermo, 1854, *Empedocle*, vol. iv.—"Studii sulla pubblica beneficenza," Palermo, 1855, *Empedocle*, vol. v, p. 187.—*I Porti franchi, riflessioni economiche*, 1 vol., Palermo, 1857, Grimaldi.—"Della proprietà intellettuale, e del diritto di copia," Palermo, 1859, *Empedocle*, nuova serie, vol. i.—"Popolazione e miseria," Palermo, 1859, *Empedocle*, nuova serie, vol. i. p. 299.—"Monti di Pietà," Palermo, 1859, *Empedocle*, nuova serie, vol. i.—*Sugli asili infantili e sul modo di istituirli e regolarli in Sicilia; discorso*, Palermo, 1860, Lo Bianco.—*Statistica del pubblico insegnamento in Sicilia*, Palermo, 1861, in 8vo.—*Sulla scienza statistica e sue applicazioni alle forze morali e materiali dei varii Stati d'Europa e specialmente del regno d'Italia*, Firenze, 1867, in 8vo.

M. P.

BLACK, DAVID (about 1700), a Scotch writer, was the author of *An Essay upon Industry and Trade, shewing the Necessity of the One, The Conveniency and Usefulness of the Other, and The Advantages of Both*, Edinburgh,

1706. This treatise shows very clearly the state of economic opinion in Scotland before HUME and SMITH. The author repeats all the traditional dogmas concerning the balance of trade and the necessity of increasing the quantity of money. He opposes, however, the schemes of "credit upon a land security," by maintaining that "the nation's industry is the best fund of credit to support it" (p. 3). After all his mercantilist views it is very remarkable to find him saying; "I do confess it is my private Opinion that all Imposition whatsoever should be taken off Trade, and that there should be no Taxes upon it. . . . For it's Evident, when heavy Duties are upon Goods, some Merchants run these Goods without paying any Duty, and then they Undersell their Neighbours who pay it. . . . Whereas, by an Exemption of all Duty and a freedom of Trade, (with this Caution alwise, That what is superfluous may be Prohibit), then every Merchant will be on equal footing; and he who is most Capable to manage a Trade, will have the most Advantage, and all will redound to the Merchant's Interest" (p. 27). Black proposes to remedy the deficiency in the public revenue by an imposition upon "probative writs, except Bills of Exchange," or if this should not suffice "the Land tax should be thought the surest Fond." He seeks to convince the landed interest that the merchants, though advancing the amount of the duty in the price of the goods, shift the charge upon the buyers, and that the landed men bear indirectly, through this course, a heavier burden than by the way he proposes. Black illustrates the advantages of a free trade by the examples of the Grisons and Holland (pp. 29, 30), the first of which had been suggested to him by Bishop Gilbert Burnet.

[See Bishop Burnet's work: *Some Letters Containing an Account of what seemed most remarkable in Travelling through Switzerland, Italy, some parts of Germany, etc.* Rotterdam, 1687, p. 306.] S. B.

BLACK DEATH, THE. The pestilence or series of pestilences known by this name took place in the middle of the 14th century, and was a partial if not the chief cause of very vast economic changes in England. So far as can be ascertained, the disease first manifested itself in central China in 1333, and thence spread in a westward direction towards Europe, where its force was first felt in the southern countries. Taking a northward course, it reached England where, "about the 1st of August 1348, it began in the seaport towns on the coast of Dorsetshire, Devonshire, and Somersetshire, whence it drew up to Bristol. . . . whence it came to Oxford, and about the 1st of November it reached London, and finally spread itself all over England" (Barnes, *History of Edward III.*, pp. 435, 436). There were three great attacks of the pestilence, of which the

first was much the most destructive—August 1348 to summer 1349; August 1361 to May 1362; July 1368 to Michaelmas 1369. The period during which Europe was devastated by this plague was remarkable for the occurrence of great natural convulsions such as earthquakes, with which contemporary opinion attempted to connect it causally, and for other pestilences, attacks of which took place in 1370, 1381-82, 1396. Of its nature many descriptions remain (Hecker, *Epidemics of the Middle Ages*). Whilst the name it bore in England was derived from one of its symptoms, its terrible destructiveness won it the Italian title of *La mortalaga grande* (Hecker, p. 2).

It is of some importance when examining its economic effects to attempt to ascertain the extent of the mortality which it occasioned. This is very differently estimated. The loss of life in Europe has been roughly reckoned at 25,000,000 (Hecker). While, with regard to England, accounts nearly contemporary give estimates which cannot but be regarded as exaggerations, e.g. Adam of Usk reckons the survivors as but one-tenth of the previous population. In more recent times attempts have been made to found conclusions on such statistical data as may be still extant. Arguing from the clergy lists, Mr. Seebohm places the number of deaths as at least one-half. He assumes that the rate of mortality among the clergy was not exceptional. Taking then an estimate of the population living in 1377, drawn from the receipts of the poll tax in that year, he concludes that those who died numbered some two millions and a half (*Fortnightly Review*, vol. ii. pp. 149, 268). On the other hand Professor ROGERS, having regard to the quantity of wheat consumed, considers that the loss of life was by no means so great. It is possible, however, that this conclusion does not allow sufficiently for the other cereals which entered into the consumption of the great body of the people; and the data on which it rests seem less certain than those by which Mr. Seebohm was guided (*Fortnightly Review*, vol. iii. p. 191). But whether the one or the other estimate be accepted, there can be no doubt that a very great loss of life was the consequence of the Black Death. Equally there is no doubt as to the magnitude and critical importance of the economic change which it was instrumental in producing.

For some time there had been in operation two processes of widely differing tendency. By slow but certain degrees fixed money payments were being substituted for the labour rents or services originally due from the tenants to the lord of the manor. Disproportion between the money payment and the services had been manifesting itself. It was to ensure the continuance of the former substitution that the tenants began to form those "alliances" and "con-

gregations" to which we find allusion in later statutes (e.g. 1 Rich. II. c. 6). To a people thus placed the loss of a *very* large portion of the working population could not but be of the utmost gravity. The force of the economic laws of supply and demand in relation to wages began to make itself felt. There was a demand for much higher wages and an inclination to enforce this demand by combination on the part of the labourers, while the landowners on their side found themselves in need of labour as before, but unable to obtain it at the old rates. The payments which they received in lieu of labour services were insufficient for the hire of the labourers who might perform these services. As a matter of fact, this had naturally tended to be the case even before, but if it had been so before how much more was it the case now. In one instance the tenant paid in commutation $\frac{1}{2}$ d. while the labourer who performed the work received $\frac{3}{4}$ d. (*Archæologia* xi.)

But now legislation intervened. Hitherto rates of wage, when determined, had been settled in the manorial courts, or by CORPORATIONS and GILDS, but wages form the subject of the royal ordinance of 1349 (23 Edward III.) enacting "that all able-bodied servants should serve their lords, or if not required by them, any one so requiring them at the same wages as were usual before the plague." There seems little room for doubt as to the immediate connection in which this ordinance stands towards the Black Death. But legislation was ineffectual. Wages did not diminish; even before the pestilence they had been gradually increasing, and the landowners were driven to seek a new remedy. They made the endeavour to revert to the old system of labour rents. Commuted service on the land was to be done away with, and the practice of earlier centuries was once more to be followed, but now to be followed by those who regarded its introduction as an innovation. In some instances indeed it would appear that attempts were made at illegal exaction, for we find the customary tenants appealing as against their landlords to the record of DOMESDAY. The whole country was thrown into a condition of economic disorder, for the tendency toward resistance was fanned by the efforts of the friars who carried the news from shire to shire, playing the part of the newsagents of discontent. So matters stood just before the rising in 1381. Demands were made with increasing persistence for the reduction of the money payments; the landowners on their side, finding even these payments insufficient, were striving to return to the system under which the various classes of tenants had to perform service in person or by substitute; while in the third place the long French wars had increased the burden of taxation under which the nation was groaning. The universality with which these three causes

were felt, and the part which the friars played in enabling the inhabitants of the various districts to enter into communication with one another, explain the PEASANT'S REVOLT, 1381. The incidents of the rebellion and the mode in which it was met and the means by which it was suppressed are matters of political history. What were the consequences of the rising? During the struggle the rebels had destroyed many of the manor rolls, showing most clearly their desire of blotting out all record of the service which might be exacted from them; and despite the revocation of the royal grants made to them, their demand in this direction was substantially conceded. The practice of commutation was adhered to. In addition it is probable that the money payments, which even before the Black Death had been diminished, on many estates underwent reduction. Thus the second means of dealing with the economic consequences occasioned chiefly by the mortality owing to the pestilence had failed, and economic laws asserted their strength. There were, however, results consequent on the failure of these two attempts at interference. The system of cultivation had depended for its profit on the existence of a large body of cheap labour. The value of labour had been enhanced by no cause more effectually than the diminution in the supply. From this time we may date the change from arable to pasture which assumed such great proportions in the 16th century. The last stage of the mediæval system of cultivation was beginning.

It is somewhat difficult to determine the exact importance of the Black Death in bringing about the change. As we have seen, causes were already in operation which tended toward change; but that change was undoubtedly precipitated by the great and sudden loss of life endured by the nation in the middle of the 14th century. This then is the reason why the Black Death deserves so much attention on the part of the economic student. The causes of the events clustering around it display the strength of economic forces; the attempts at regulation, the uselessness of ignorant interference; and in its consequences we find the causes of the peculiar development of AGRICULTURE IN ENGLAND in the Tudor period.

BLACKLEG. (1) A card-sharp or forger; (2) a person who works for an employer whose regular workmen are out on strike. These persons are often exposed to great annoyance from the strikers, but they are somewhat pro-

tected by § 8 of the Conspiracy and Protection of Property Act 1875 (38 & 39 Vict. c. 86), which enacts that a person who for the purpose of preventing a lawful act (1) uses violence or intimidation; (2) persistently follows the person concerned from place to place; (3) hides his tools or other property; (4) watches his house or the place in which he works; (5) follows him in the company of others in a disorderly manner through a street, is liable to a fine of £20 or to imprisonment for three months with or without hard labour (see STRIKES). E. S.

BLAIRIE, DROIT DE. A right of the French lords to exact payment for leave to graze on open or waste lands within their territories. This right only existed in provinces regulated by *droit coutumier*.

[De Tocqueville, *France before the Revolution* (London, 1873), note lxxvii.] R. L.

BLAKE, WILLIAM, F.R.S.; author of—

Observations on the Principles which regulate the Course of Exchange, and on the Present Depreciated State of the Currency (London, 1810); *Observations on the Effects produced by the Expenditure of Government during the Restriction of Cash Payments* (London, 1823); and of *Observations in reply to a Pamphlet by the Rev. Richard Jones, on the Assessment of Tithes to the Poors' Rate* (London, 1839). F. Y. E.

BLANC, JEAN JOSEPH LOUIS, born at Madrid, 1813, died at Cannes, 1882. His first work for some years after the Revolution of 1830 was in journalism; he wrote in *Le Progrès du Pas-de-Calais* and in *La Revue démocratique*, then in *La Nouvelle Minerve*, all republican journals. Afterwards he became chief editor of *Le Bon Sens*, and then founded *La Revue du progrès social*, in which appeared, in the year 1839, the articles which, collected and extended, formed the volume entitled *L'Organisation du travail*, which made the reputation of Louis Blanc as leader of the socialist school. He afterwards employed his unquestioned talent as a writer on two works, the one, *Histoire de dix ans*, a pamphlet in five volumes, assuming a historic form, and directed against the monarchy of July; the other, *Histoire de la révolution française*, three volumes of which had appeared when the Revolution of February 1848 broke out. Elected a member of the provisional government, as he could not obtain the formation of a "ministère du progrès," he was appointed president of a "Commission de gouvernement pour les travailleurs," which he established in the palace of the Luxembourg in the Chamber of Peers. This commission was composed of delegates from the working classes, supported from outside by 100,000 bayonets. In its discussions he put forward with a too feverish eloquence, considering what the character of his audience, and of the unsettled period then passing, was, the most revolutionary and socialistic ideas. This did not hinder

Wladyslaw from having the courtesy to oppose him face to face in debate. Did Louis Blanc contribute to the formation of the *ateliers nationaux* of unhappy memory, the dissolution of which brought on the insurrection of June 1848? This has never been proved. Louis Blanc denied it vigorously. His powers expiring with the opening of the National Constituent Assembly, he became only an ordinary "representative of the people;" but he had to pay for the rashness of his language during the discussions at the Luxembourg, the consequences of which he could not escape, and suffered in reputation more from his speeches when president of the "Commission des travailleurs" than on account of his acts after he ceased to hold that office. When the invasion of the chamber of the 14th May 1848 occurred, he had to take refuge in England, whence he did not return till 1870. Before doing this he had founded a journal, *Le Nouveau Monde*, which had only a very limited success (1849-51). He then wrote in the French journal *Le Temps* (the second of that name) letters on London, which were much remarked on at the time. On his return to France he was returned a member for Paris to the National Assembly, and subsequently of the Chamber of Deputies. He was a rhetorician and a philanthropist rolled into one. "C'est un chémin double d'un philanthrope," said M. G. de Molinari of him. With a warm heart and a bad judgment, Louis Blanc was not a man for action; he dreamed of the absorption by the state of factories and shops in which work was suspended at the time. He proposed to make use of these by handing them over to the working men, under the direction of the state, in order that they might ruin by their rivalry the factories and shops which still held on, so that, some day or other, the state should become the sole entrepôt of industry. The division of profits (no one imagined that losses could occur) was to be made in the following manner. There were to be no more any wages—wage-receiving being abolished—but every one was to receive "according to his wants." This very simple method of division was the first proposed by Louis Blanc. When he became president of the "Commission de gouvernement pour les travailleurs," he modified this method and replaced it by another more simple still; an equal division per head. Honour was in his eyes a sufficient inducement to labour, and more efficacious than self-interest. He had less knowledge of technical details than his brethren in socialism, and his proposals were always surrounded by a mist of vague uncertainty which renders a critical appreciation of them both difficult and at the same time little conclusive. The collectivists in our days, though on the wrong path, have gone more to the bottom of their subject.

[While in England he wrote, in English, his

book entitled,—1848, *Historical Revolution, inscribed to Lord Normanby*. By Louis Blanc. Chapman and Hall, 1858.] A. G. F.

BLAND ACT. A law of the United States passed 23rd February 1873, which restored the silver DOLLAR of 412½ grs., $\frac{1}{16}$ fine, to the list of coins of the United States, and directed the secretary of the treasury to purchase silver bullion, and coin into such dollars not less than two million dollars' worth (say £400,000), and not more than four million dollars' worth (say £800,000) per month continually. By the Coinage Revision Act of 12th February 1873 the gold dollar of 25½ grs., $\frac{1}{16}$ fine, was declared the UNIT OF VALUE in the United States, and the silver dollar was omitted from the list of coins authorised to be struck at the mint. This act did not make mention of any dollar, with the exception of the *trade dollar* of 420 grs., $\frac{1}{16}$ fine, manufactured for the trade with China; it ordained that the gold coins should have unlimited paying power, and that the silver coins should have paying power up to the amount of five dollars. That portion of the act of 1870 which made the gold dollar the unit of value was not altered by the act of 1873, but under it the silver dollar became legal tender to an unlimited amount, "except in cases where it is strictly stipulated otherwise in the contract." The act of 1873 likewise authorised the issue by the treasury, on the deposit of coined silver, of silver certificates of deposit in denominations of ten, twenty, fifty dollars, etc. Under this act \$299,708,790 (say £60,000,000) had been coined in silver dollars up to 30th June 1883, but of these \$245,870,487 (say £48,700,000) remained in the treasury on that date. Against this stock of coined silver certificates to the value of \$228,491,772 (say £45,800,000) had been granted, but of these \$29,104,096 (say £5,820,000) were in the treasury (see *Report of the Director of the United States Mint*, 1883, pp. 74, 209). The effect of the Bland Act has been to cause a large portion of the legal tender of the United States to be held in silver; the total metallic stock being estimated on 1st November 1883 approximately as:—

	Cost Value.	
Gold	\$713,705,050	say £142,360,000
Silver	\$299,370,484	.. £59,870,000
	\$1,013,075,534	.. £202,230,000

The Bland Act is sometimes termed the "Allison Act."

By an act of Congress passed 14th July 1890 the provisions of the Bland Act, which required the monthly purchase and coinage into silver dollars of not less than \$2,000,000, and not more than \$4,000,000 worth of silver, were repealed, and the secretary of the treasury was directed to purchase silver bullion to the extent of 4,000,000 oz. monthly at a price not exceeding \$1 per 371.24 grs. of pure silver, against

which silver treasury notes were to be issued. It was left to the secretary of the treasury, at his discretion, to redeem these notes in gold or silver coin, it being, the act continues, "the established policy of the United States to maintain the two metals on a parity with each other upon the present legal ratio, or such ratio as may be provided by law." This legislation has led to a decrease of the gold and an increase of the silver coin and bullion held in the United States, the amounts being approximately estimated in the *Report of the Director of the United States Mint*, 1900, p. 37, as follows:—

Total Metallic Stock, 1 July 1900.

Gold	\$1,034,439,264	say £206,887,852
Silver	647,371,030	„ 129,474,206
	<u>\$1,681,810,294</u>	<u>£336,362,058</u>

[The lowest prices of silver in bars for the years 1873 to 1889 inclusive, and for 1889 were:

1873-89.

2d to 6th August 188642d.
(The highest price during the whole month of August 1886 was 42½d.)

18th May 1888 (the one day only)41½d.

(For the whole of May to August 1888 the price did not rise above 42½d., and at several different dates in May, June, and July, stood at 42d.)

1889.

31st May to 28th July42d.

1900.

Article by F. W. Taussig, *Quarterly Journal of Economics*, April 1890.]

BLANK CREDIT. Credit given by a banker on the personal security of his client. One form of blank credit which is frequently granted by continental banks and foreign banks established in London consists in the acceptance of drafts issued by the customers or for their account on the understanding that they will cover the same before maturity. The drawer of such bills can discount them on the strength of the banker's acceptance, and the banker can give credit without any cash outlay. The system of granting and using blank credits is liable to great abuses, but on the whole it may be considered a useful if not indispensable element in the machinery of trade.

BLANK ENDORSEMENT. A bill of exchange endorsed in blank, the meaning of which is that a bill on which the endorser has only signed his name becomes payable to bearer, and is negotiable by mere delivery (see **BILL OF EXCHANGE**). See also for further particulars *The Practice of Banking*, by John Hutchison.

BLANK TRANSFER. A deed purporting to assign the property in shares or other registered securities in which the transferee's name is left in blank. A document of this nature is frequently used in cases of sale or pledge, and, if accompanied by the certificate relating to the security to which it refers, generally authorises the holder to fill in his own name, and to have himself registered as owner of the security. Difficulties may occur when the transferer fraudulently executes several transfers relating to the same security, and in other cases, and the holder of the transfer ought to exercise great care (see Lindley, *Company Law*, p. 471 seq.)

E. S.

BLANQUI, JÉRÔME ADOLPHE, born 1798, died in Paris 1854. The economist Blanqui, who must not be mixed up with his brother L. A. Blanqui, the revolutionist, was, from 1830 to his death, the head of the *École de Commerce* of Paris, and in 1833 replaced J. B. SAY as professor of political (and especially of industrial) economy at the *Conservatoire des Arts et Métiers*. He was elected, 1838, a member of the *Académie des Sciences morales et politiques*, and represented the department of the Gironde in the Chamber of deputies. Marshal Bugeaud, with whom he was very intimate, thought of making him the civil administrator of Algeria. Blanqui had travelled nearly over all Europe, and only left off travelling when his health compelled him to remain at home. It may be said that the whole of his life was spent in one long and laborious inquiry, principally directed to the solution of those questions relating to the working classes, the importance of which he had realised more clearly than most of his contemporaries. The brilliancy and vigour of his language added an additional attraction to his teaching.

Parts of the course of lectures delivered by Blanqui were published by MM. Blaise and J. GARNIER. Blanqui also was the author of several works. Of these the most important are: *Résumé de l'histoire du commerce et de l'industrie*, Paris, 1826, in 18mo.—*Précis élémentaire d'économie politique*, Paris, 1826 and 1842, in 32mo.—*Histoire de l'économie politique en Europe, depuis les anciens jusqu'à nos jours, suivie d'une bibliographie raisonnée des principaux ouvrages d'économie politique*, Paris, 1838, 1842, and 1845. This last work has been translated into several languages. We may also mention the notices written by Blanqui of the French exhibition of 1827, and particularly that on the great exhibition of London 1851. His researches on the position of French workmen have been continued by M. Baudrillart. Blanqui left behind him several manuscript fragments and studies which it is hoped that his son-in-law, M. Maze, will publish.

A. de F.

BLENCH (Scots law term). Lands held

blench are held subject to payment of merely a trifling duty, which is exigible only if asked within the year. Analogous to PETIT SERGEANTY.

BLOCKADE. A blockade may be defined as the prevention of commercial intercourse between a port or a portion of the coast in an enemy's country and neutrals, by means of vessels of war sufficient in number to render any neutral vessel attempting to reach such port or coast liable to capture. A blockade being a belligerent act, must be instituted by sovereign authority, and a naval force must be present to maintain it. The extent of a blockade is determined by the efficiency of the blockading squadron. Some continental writers, such as Heffter (*Das Europäische Völkerrecht der Gegenwart*, § 155), and Ortolan (*Règles internationales et Diplomatique de la Mer*, ii. 328) maintain that the blockading force should be anchored, a view that has not been accepted by the prize courts of England and the United States. A blockade is violated by any attempt at ingress or egress, but whilst English and American prize courts hold that the bare act of sailing for a blockaded port is an act of violation, provided there is reason to believe the captain knows of the existence of the blockade, the French practice is to warn the captain on approaching the coast, and only to seize the vessel if a subsequent attempt is made to enter. The penalty for a breach of blockade is the confiscation of the ship, but the cargo is liable to be condemned if its owners are in any way privy to the breach.

The prohibition of commerce with neutrals involved in a blockade is based by Hautefeuille (*Des droits et des devoirs des nations neutres en temps de guerre maritime*, 3d ed. ii. 178, 181) on a supposed conquest of the enemy's territorial waters; by Ortolan (*Diplomatique de la mer*, 2d ed. ii. 293) on an "occupation" of the sea, which gives to the occupier "sovereign rights." Historically the rules of blockade are a modification of the old principle that war was "omnium in omnia et in omnibus," and therefore he who was a neutral was an enemy. All intercourse with an enemy was unlawful. In process of time neutral states made good their claim to a distinct status, and it is now recognised that in time of war the trade of neutral individuals should be as free as in time of peace. This principle, however, comes in conflict with the long established right of a belligerent to cut off commercial communications with the enemy, and the modern rules of blockade are a compromise between belligerent and neutral rights. The right of the neutral subject to trade is recognised in the fact that, by violating a blockade he does not violate the neutrality of his state, and if the vessel escapes he suffers no punishment. The belligerent right is recognised by permitting the blockade to be established, and by authorising the belligerent to

confiscate any vessel that may be caught in the act of violation.

A blockade, if on an extended scale, may inflict great injury on neutral states. During the four years that the blockade of the Southern States was maintained by the North American States, the export of cotton to England ceased, and those engaged in the cotton industry suffered great privation, and the exportation of wine from France to the United States became impracticable. Hence the prohibition of commercial blockades, and of the capture of all private property at sea, has been advocated. From an economic point of view it is certainly desirable that the capture of private property should be abolished, but as Fauchille points out (*Du Blocus Maritime*), every act of war affects neutrals, and the arguments for the protection of private property are arguments against the practice of war itself (see INTERNATIONAL LAW).

[See Calvo's *Droit International*, Paris, 1881; *Du Blocus Maritime*, par Paul Fauchille, Paris, 1882.—Hall's *International Law*, Oxford, 1889.]

J. E. C. M.

BOARD. A body of persons officially constituted for the transaction of some particular business, so called from the "board" or table round which meetings were held. Some government departments are designated by this title, e.g. board of trade, board of inland revenue, local government board, poor law board. The term is also applied to the directors or persons charged with the management of a company.

J. E. C. M.

(*Economic Opinion on Boards.*) "Boards," said BENTHAM, "are screens," a phrase which describes very well the extreme position of economists who distrust governmental control in industry. The term is applied to particular departments of the administration of the central government, e.g. the board of trade, the board of agriculture; to similar divisions of local government, e.g. board of guardians, school board; and also to various permanent committees charged with the supervision of particular industries, e.g. the Scottish fishery board. It was one of the main principles of Adam SMITH, that, if governmental control were proved to be desirable, it was better to throw the responsibility on the persons and localities directly interested. The constitution of boards of various kinds is the logical outcome of this principle, the central authority only laying down general rules for guidance.

J. S. N.

BOARD OF AGRICULTURE (1793). Seven years after the reconstitution of the board of trade, the House of Commons, on the motion of Sir John SINCLAIR, voted £3000 a year towards the expenses of a board of agriculture (17th May 1793). The board was duly chartered: it was to consist of certain specified government

officials and lay coadjutors, the latter including Sinclair himself, who became the first president, and Arthur YOUNG, who became secretary. Though the minority in the House regarded the board as simply a new refuge for place-hunters, the enthusiasm of president and secretary carried it into good work at once, and, for a time at least, falsified fears. On its first meeting (4th September 1793) it drew up a plan of inquiry on a large scale. Intelligent farmers throughout the kingdom were to be provided with a list of queries relating to their business which they were to be invited to answer and send to the board, for the general benefit of the agricultural interest. In the second place, in every county some competent person was to be chosen to draw up a survey of the state of agriculture in that county, to be remitted to the board for publication. This plan was duly carried out, and the result was given to the world in sixty or seventy separate publications, of various degrees of merit. The survey of Sussex was by the son of Arthur Young, and the survey of Suffolk by Young himself, who contributed also to the 3d and 6th volumes of *Communications* published by the board between 1802 and 1806. These *Communications* include also papers, letters, or speeches by George Washington, Dr. Priestley, Sir Joseph Banks, Sir Humphry Davy, Morris Birkbeck, Watson, bishop of Llandaff, and Sir John Sinclair, with others of lesser note, English and foreign. One of the objects of the board was to keep England alive to foreign improvements. Another of course was to encourage improvements at home; and, as a matter of fact, the lectures of Sir Humphry Davy, given before the board in 1802, made an epoch in agricultural chemistry. Prizes were given for agricultural essays and experiments. Another object of the board was more general,—to provide accurate statistics of lands, produce, stock, and even population; there is, for example, in vol. ii. of the *Communications*, an “abstract of baptisms and burials” for four of the parishes in each of fifty counties, drawn up in 1800. Both in the *Communications* and in the several Reports for the counties, there is a mass of information, observations, and opinions, not only in regard to the technical points of agriculture and pasture, but in regard to the poor law, the condition of the poor labourer and the farmer, the incidence and amount of rent, rates, and tithes, the progress and effects of enclosures, the movements of population, and the working of such experiments as the system of small allotments. Accordingly these volumes contain materials for the social and industrial history of the country districts of the kingdom, which are of undoubted value though they have been little utilised.

A general view of the work of the board for its first three years is given in the first volume

of the *Communications*, which contains also the text of the Charter of Foundation, dated 23d August 1793. The grant of £3000 was withdrawn in 1817, a year of distress when the government was much pressed to reduce expenditure. No doubt the Smithfield Club, the Highland Society, the Bath and West of England Agricultural Society and other private bodies were doing its work equally well; but it is not just to describe the board as simply “the pet scheme of King George” with no life of its own (Martineau, *Thirty Years' Peace*, iv. 448). In the present year (1889) it has been re-established by Lord Salisbury's administration.

[*Reports to Board of Agriculture from the several counties* (var. dates).—*Communications to the Board of Agriculture*, 1802-6, 6 vols.—*History of the Progress of Great Britain*, R. K. Philp, 1859 (specimens are given of the queries to farmers, p. 117).—M'Culloch's *Literature of Political Economy*, 1845 (a list of surveyors is given, but not in a useful or accurate form, p. 215)—*Correspondence of Sir John Sinclair*, vol. i. 406-407, etc.—*Life of Sir John Sinclair*, i. 253, etc.—*Annual Register*, 1793, p. 118.—R. E. Prothero's *English Farming*, 1888, p. 69.] J. B.

BOARD OF AGRICULTURE (1889). By a recent act—Board of Agriculture Act, 1889 (52 & 53 Vict. c. 30)—a board of agriculture for Great Britain was re-established 12th August 1889. The board consists of the lord president of the council, her majesty's principal secretaries of state, the first commissioner of her majesty's treasury, the chancellor of her majesty's exchequer, the chancellor of the duchy of Lancaster, and the secretary for Scotland, and such other persons (if any) as her majesty the queen may from time to time think fit to appoint during her majesty's pleasure.

Any member of the privy council may be president of the board.

There are transferred to this board the duties of the privy council under the Destructive Insects and Contagious Diseases (Animals) Acts, the duties of the land commissioners for England under the TITHE commutation acts, the COPYHOLD acts, the acts for inclosure, exchange and improvement of land, and the duties vested in the commissioners of her majesty's works and public buildings under the Survey Act, 1870. The board is also to “undertake the collection and preparation of statistics relating to agriculture and forestry, and may also undertake the inspection of, and reporting on, any schools which are not public elementary schools, and in which technical instruction, practical or scientific, is given in any matter connected with agriculture or forestry, and the aiding of any school which admits such inspection, and in the judgment of the board is qualified to receive such aid, and the aiding of any system of lectures or instruction connected with agriculture or forestry, and the inspection

of and reporting on any examinations in agriculture or forestry." It may also make or aid in making such inquiries, experiments, and research, and collect or aid in collecting such information as they may think important for the purpose of promoting agriculture or forestry. "The muzzling of dogs, and the keeping of dogs under control," are among the duties of the board with the Contagious Diseases Animals Acts, and it is also stated that in the act establishing it, the expression "agriculture" includes horticulture.

The president of the board may have a seat in parliament. The operations of the board may, under the powers mentioned above, become very extensive and important. The re-establishment of this department is, however, too recent to allow of any further details of its working to be given.

[*Board of Agriculture Act, 1889* (54 & 55 Vict. c. 39).]

BOARD OF TRADE. Great Britain possesses no ministry of commerce nor any department specially charged with the superintendence of industry. The home office has some supervision over factories and workshops, mainly as to hours of labour of women and children, fencing of dangerous machinery, and sanitary condition of buildings. It publishes returns of the principal textile industries, but with no details of quantities or values of what is produced, and superintends coal and other mines in regard to safety, and it is not concerned with other matters as important to them—namely, the rates charged for conveying minerals by railway and royalties payable to original owners. In connection with manufacturing industries the science and art department gives some assistance through the South Kensington and other museums, and technical schools. With these exceptions there is little supervision over commerce and industry, except by what was originally the committee of privy council for trade and is now known as the "board of trade." Temporary councils had advised parliament concerning trade matters since the 14th century, but no permanent department was established until Cromwell instituted such a department to foster trade and navigation, and check the monopoly of the Dutch. This policy was continued after the Restoration; a committee of the privy council being appointed, 1660, to ascertain particulars of imports and exports and to improve trade. Another committee was appointed a few years later to assist the crown in farming and managing "foreign plantations," i.e. colonies. The Earl of Sandwich was president and John Evelyn one of the ten members of this second committee. In 1672 these two committees were united as a standing council of trade and plantations under the presidency of the Earl of Shaftesbury, and, in 1673, John Locke became secretary. The joint committee lasted, how-

ever, only two years, and was not revived till 1686. Locke then returned to office, though unwillingly, as one of six unofficial paid members of the board, eight principal officers of state being unpaid members. The questions referred to the establishment included inquiries into hindrances to trade, employment of the poor, and the silver currency, the great re-echo of which, 1686, was supported by Locke's writings. The new board were hardly settled in their rooms at Whitehall, altered for them by Wren, when the fire of 1697 drove them to take refuge in the building known as the Cockpit, on the site of the present council office. In 1700 Locke was compelled to resign through ill-health (*Life of Locke*, by Fox Bourne). Locke's successor was Matthew Prior, well known in his literary capacity.

The navigation acts and the mercantile system were at this time the keystones of our commercial policy. How materials might be imported free of duty, and with a bounty in some cases, but heavy penalties usually prohibited their exportation. In the case of wool, even movement from village to village within a few miles of the coast was prohibited. British colonies were favoured by Discriminatory Duties, but when conflicts arose between the interests of home manufacturers and colonies, the latter usually went to the wall. A secretary of state for the colonies to undertake the control of the plantations was appointed 1743. This control passed, 1782, to the home secretary, 1800 to the war department, 1854 to the present colonial office. Amosson was for a few years one of the lords commissioners of trade previous to his appointment in 1717 as secretary of state to George I. Gibbon the historian was made one of the eight lords commissioners in 1779 at a salary of £1000 a year, but was ousted three years after, mainly through Burke's attack on the public office (1780). (*CONSTITUTIONAL HISTORY*, vol. xvi. p. 282.) The contest between Burke and the ministry was, as regards the board of trade, whether unpaid commissioners of trade, chosen from time to time, would not be preferable to a permanent highly-paid council, which Burke described as "a sort of gently-opening hot-house, where eight members of parliament receive salaries of a thousand a year in order to mature at a proper season to a claim for two thousand." Burke's motion for the abolition of the board of trade and the colonial and other offices was carried in the House of Commons by a majority of eight. Reductions resulted of between £200,000 and £300,000 a year, including £11,000 for the board of trade. Another permanent committee of the privy council was formed in 1786, by order in council which still mainly regulates the legal constitution of the office. The duties of the revived board were chiefly as a contrary

before, with questions relating to food supply and restrictions on the exportation and importation of corn.

Experience of difficulties in administering any **SLIDING SCALE** of corn duties had much to do with disposing the board towards a free-trade policy. Mr. HUSKISSON's efforts in removing restrictions on foreign trade, followed by Mr. Gladstone's (1842) carrying out PEEL's tariff reforms were ably seconded by the permanent staff, including Mr. G. R. PORTER and Mr. MACGREGOR. Porter was the founder of official statistics, the accounts published by government before he became chief of the statistical department, 1832, having been merely crude and undigested masses of figures. The *Progress of the Nation* made him famous as an economist and he was promoted secretary of the board of trade 1847. Mr. R. Giffen, C.B., now an assistant secretary, became chief of the statistical and commercial department 1876. Meanwhile, as state supervision over food supply and general trade became obsolete, joint-stock companies, railways, and shipping required supervision, and further changes were made, the president being practically secretary of state for trade. The vice-president became, 1867, a parliamentary secretary with similar duties to those of a parliamentary under secretary of state. Efforts have been made to change the title of the office into "Ministry of Commerce" presided over by a titular secretary of state, but a more obvious improvement would be to incorporate with the board some consultative members of technical knowledge and trade experience, such as eminent shipowners, merchants, and manufacturers, who could be called in to advise the president.

The departments must be described somewhat in detail.

1. *The Commercial Department* deals with commercial questions generally. It also provides the statistical abstracts for the United Kingdom, the colonies, and foreign countries: trade, shipping, railway, emigration, and fishery statistics, including a record of price of corn, foreign and colonial customs, tariffs, and trade regulations. Labour statistics have now special attention. A *Monthly Journal* gives commercial information principally from official sources.

A separate bankruptcy department has been organised since the Bankruptcy Act of 1883. The principle of this act is administration of bankrupts' property by or under a department amenable to parliamentary control (see **BANKRUPTCY LAW**; **DEEDS OF ARRANGEMENT**).

2. *The Railway Department*, established 1840, inspects railways before opened, reports on proposed railways, accidents, bye-laws, arbitrators, and other duties under various railway acts. The Railway and Canal Traffic Act (1888) in regard to rates for conveying goods; tramways, their bye-laws, and "provisional orders," i.e. omnibus bills approved by some public department before being submitted to parliament, come under this department, with gas and water schemes, electric lighting, and

copyright. The patent office, a subordinate department, has charge of **PATENTS**, designs, and **TRADE-MARKS**. It is possible that some of these powers may be transferred to the new county councils.

3. *The Marine Department*, established 1850, regulates the survey of passenger steamers, compulsory examination of masters and mates, shipping offices for engagement and discharge of seamen, and generally all questions relating to ships and their crews, including the detention of unseaworthy ships and inquiries into wrecks.

4. *The Harbour Department* has charge of foreshores belonging to the crown, and protects navigable harbours and channels, lighthouse funds, Holyhead and Ramsgate harbours and Dover pier. Wreckage and quarantine are also under the charge of this department, and standards for weights and measures, and hall marks.

5. *The Finance Department* deals with the accounts of all branches of the board of trade, of harbours, lighthouses, and mercantile marine offices, merchant seamen's fund, consuls' accounts for disabled seamen abroad; marine savings banks and seamen's money orders, life insurance companies' accounts and bankruptcy estate accounts.

6. *The Fisheries Department* deals with all questions respecting sea fisheries. International arrangements connected with the North Sea and other fisheries, and generally all matters relating to fishing vessels and their crews, besides salmon, oyster, and lobster fisheries and shore fishings, now come to this department.

BOARDING-OUT SYSTEM. The boarding-out system is one of several attempts to solve the problem of training pauper children, and is practised in the United Kingdom, in France, Germany, Russia, Switzerland, Canada, and the United States. In relieving adult paupers the main object may be said to be, to make the condition of the pauper as little enviable as possible; in the case of pauper children there is a further aim, viz. to prevent the permanence of a state of pauperism, and to train good citizens. Various methods have been suggested to attain these ends. It was at one time the custom to keep children in workhouses, in a separate part of the building from aged and adult paupers, under instruction and discipline. The evils of this system, which are possibly exaggerated, lie in the danger lest a child should acquire the so-called "pauper taint"—that is, a predisposition to relapse into pauperism. To this must be added a total ignorance of the world, due to artificial surroundings, which not only unfits a child for any walk in life, but makes him an easy prey to temptation. These evils are now, as a general rule, modified by the practice of sending children to the ordinary parish schools. The first real reform in the system was the establishment of district schools in which the children of one or more unions are boarded and educated. The results of the training given in such schools are very favourable, a comparatively small percentage of the children becoming paupers in later life. Against

them it is urged that individuality is lost, that the training given is too mechanical, that the little incidents of daily life are wanting, so that no sense of property is acquired, that they are favourable to the development of certain diseases, e.g. ophthalmia, and that the diet lacks variety. A further modification is seen in the building of villages, consisting of cottage-homes, in each of which a small number of children form an artificial family, but an objection to this system lies in the cost. It is claimed for the boarding-out system that, whilst avoiding the above-mentioned evils, it has great advantages of its own. Thus children are placed in ordinary families, are adopted by foster-parents carefully selected, who lodge, board, and clothe them in return for a weekly payment by the guardians, and who are under close supervision. Thus the "pauper taint" is wholly absent, and the advantages of home life are secured to the child; the relations between the foster-parents and the children often develop into real affection, and the tie between them is as strong or stronger than that in ordinary families: the surroundings are precisely those in which a child will find itself in later life, for which therefore it receives an appropriate training. Lastly, it is far cheaper than any other system. Thus, the cost of maintenance of a child in a workhouse may be set at 4s. 10d. weekly, exclusive of the cost of buildings, etc., the weekly cost in a district school at 8s. 6d., in a cottage-home at 9s. 5d., on the boarding-out system at 4s. 3d. Two kinds of difficulty suggest themselves. First, the practical difficulty of securing adequate supervision. The supervision is partly in the hands of volunteers, partly of union officials, subject to inspection by an official of the local government board. The reports of this last, Miss Mason, though on the whole encouraging, show that lamentable shortcomings are not uncommon, for instances are quoted of neglect and even cruelty on the part of foster-parents. To this may probably be attributed the small extent to which the system has been adopted, and its unpopularity among the poorer classes. The second objection is one of principle. Under this system the children of paupers are placed in a better position than the children of independent labourers, the amount expended upon them being larger than these last can possibly afford. Hence the motive to support his own family is weakened on the part of the ordinary man by the sight of the superior provision made for the family of his improvident neighbour, and a direct incentive is given to an increase of population by recklessly early marriages.

The boarding-out system is regulated by two orders of the Local Government Board, issued in 1889, which superseded the orders issued in 1870 and 1877. Under these orders orphan and deserted children, or the children of permanent

inmates of a workhouse, and others who are practically orphans, may be boarded out: (1) outside the union to which they are chargeable, in which case they are under the supervision of a certified committee; or (2) inside the union, when the responsibility is shared by a committee and the officers of the union. The total number of children boarded out in England and Wales on 1st January 1890 was 4366.

[The Association for promoting the Boarding-out of Pauper Children has published numerous reports, etc., on the system. Discussions upon it are to be found in almost every annual report of the Poor-Law Conferences, and the history of the movement may be traced in the annual reports of the Local Government Board.] L. R. P.

BOCCHI, ROMEO, who came from Bologna, published in 1621, at Venice, a book on money, in two volumes, dedicated to the pope Gregory XV. *Della giusta universal misura e suo typo*. The first volume has the sub-title *Anima della moneta*, and the second *Corpo della moneta*. Although very primitive in his views, this author is not uninteresting. M. P.

BÖCKH, AUGUST (1785-1867), the eminent philologist, was author of the classical work on the political economy of ancient Athens, *Staats-haushaltung der Athener*, 1817. This book was translated into English by Sir G. CORNEWALL LEWIS (1828, 2d ed. 1842). Another of Böckh's treatises is useful for the study of the economics of antiquity, namely *Metrologische Untersuchungen über Gewicht, Münzfüsse und Maasse des Alterthums*, 1838. J. K. I.

BOCLAND. After the land of England had been distributed among the original German invaders, a considerable surplus remained undistributed, which was regarded as the property of the tribe, and was known as *folkland*. From this private estates were in subsequent times given to individuals, as a reward for eminent services, especially in war. Such grants were made by *boc* or charter, issued by the king and his *witenagemot* or council of wise men: and land so granted was called *bocland*. Bocland could be freely alienated either during lifetime or by will; and we learn from a law of Alfred that it could also be entailed, i.e. limited in descent to a single family.

[Stubbs, *Constitutional History*, vol. i. ch. v.—*Essays in Anglo-Saxon Law* (Boston and London, 1876), pp. 55 seq.] R. L.

BODIN, JEAN, who was a rival of MACHIAVELLI and a precursor of MONTESQUIEU, was born at Angers, 1520, and died of the plague, at Laon, 1596. His principal work, *De la République* (1577), published originally in French, then translated into Latin by the author himself, has not for its object, as its title might lead the reader to suppose, a panegyric on the republican form of government. While deriving everything from the sovereignty of the people, Bodin

admits that the only practical method is the perpetual alienation of this sovereignty in favour of a monarch and his heirs. He fixes no limits to this alienation, but he desires a "Gouvernement tempéré sans être démocratique." States-General like those at Blois (1576), in the deliberations of which he had shared, with more courage and ability than success, are, in his eyes, the proper remedy for an excess of absolute power. This was, in some respects, the representative monarchy of our days. He also supported the idea, developed later by Montesquieu, that climate has a dominant influence on the form of government; theocratic in the south and east, military in the north, free in the countries lying between these. Maintaining resolutely, through conviction, liberty of conscience, he was also a declared opponent of slavery. In political economy he supported principles universally admitted in our days against a *sieur de Malesroit*, who, had it not been for two pamphlets by Bodin, would be perfectly unknown at the present time (*Réponse aux paradoxes de M. de Malesroit touchant l'enchérissment de toutes les choses et des monnaies*, Paris, 1568, in 4to, and *Discours sur le rehaussement et diminution des monnaies, pour réponse aux paradoxes du sieur de Malesroit*, Paris, 1578, in 8vo). He also published *La Demonomanie* (1587), and other similar works; for, strange as the fact is, this man, of such powerful intellect, was nevertheless a believer in sorcery and witchcraft.

[M. Ad. Franck, in his *Réformateurs et publicistes de l'Europe* (Paris, 1864, in 8vo), has written on Bodin in eloquent terms; but the work through which both he and his books will be best known is the volume of M. H. Baudrillart (*Jean Bodin et son temps*, Paris, 1853, in 8vo).]

A. C. f.

BODY CORPORATE or **CORPORATION** is an artificial or juristic person which preserves its identity and the rights conferred on it through a perpetual succession of natural persons. Corporations are either *sole* where composed of one person, or *aggregate* where composed of two or more persons. They are also divided into *ecclesiastical* corporations, and *lay* corporations. Of lay corporations the most important are municipal corporations and trading companies. Corporations are created either by charter or by act of parliament, but some base their existence on prescription. Their powers of acquiring, holding, or disposing of property depend partly upon the instrument calling them into existence, and partly upon the objects for which they were created (see **CORPORATION**, **MUNICIPAL**; and **COMPANIES**).

[As to the extent to which a corporation can enter into contracts, see *The Principles of Contracts*, by Sir F. Pollock, London, 1888.] J. E. C. M.

BŒCLER, **JOHANN HEINRICH** (1611-1672), a German writer, born at Cronheim in Bavaria, was professor of history, philosophy, and politics

at Upsala and Strasburg. In his posthumous *Institutiones politicae: accesserunt Dissertationes Politicae ad Selecta Veterum loca et libellus memorialis ethicus*, Argentorati, 1674, Bœcler assails the opinions of GROTIUS on the original community (p. 61), and those of ALTHUSIUS (p. 104) concerning the original sovereignty of the people. His economical opinions on money, taxation, and population are for the most part founded upon BOTERO, BESOLD, BORNITZ, and Gryphiander. The first-named may have suggested his distinction between the arts which assist or hinder the increase of population, trade, schools, and courts belonging to the former, false promises and robberies to the latter (l. iv. c. v. p. 209). Bœcler's dissertation "on the science and study of politics" (p. 503 ff.), in which he deprecates the study of PLATO and recommends ARISTOTLE, gives a curious example of what was the state of the science in Germany in his time.

[See *Allgemeine Deutsche Biographie*, ii. bd. pp. 792, 793.—Roscher, *Geschichte der National-Oekonomie in Deutschland*, 1874, pp. 209, 262, 263.] S. B.

BOILEAU (or **BOYLEAU**) **ÉTIENNE** (born about 1200, died about 1272), is said to have been of Angevin origin. He joined the Crusades under Louis IX. (St. Louis), was captured, and ransomed by that monarch at a high price. At one time provost of Orleans; he subsequently became (1258-1270) provost of Paris, by special appointment of Louis IX. who sought a man of sufficient strength and integrity to maintain social and industrial order in Paris. Up to that date the post of provost had practically been farmed out to speculators, who recouped themselves by exactions and the receipt of bribes. Boileau, a man of noble birth and incorruptible character, suppressed venality, meted out vigorous justice, established the police of Paris, and hanged his godson for theft, and a friend for dishonesty. St. Louis, as a mark of confidence and approval, sometimes sat beside him at the Châtelet, where he administered justice. But the great work of Boileau was his compilation, about 1268, of the *Livre des Métiers*, a code of the regulations affecting the various industries of Paris. The exordium states the intention of the compiler, to treat of (1) the trades of Paris, their ordinances and the breaches thereof, with the appropriate fines; (2) fees, tolls, taxes, and dues; (3) justice and jurisdictions in Paris and the neighbourhood. The third part either was not written or has been lost.

The ill-defined privileges claimed by the numerous industrial corporations of Paris had become, in many cases, oppressive and encroaching. Boileau cited before his tribunal representatives of the separate crafts in turn, inquired into the grounds of their privileges,

and reduced their customs to writing in consistent order. The *Registres* so formed constitute a highly valuable record of the condition of industrial society at the time, and exhibit the whole organisation of its hierarchy—trade privileges, masters, apprentices, their number, conduct, terms of service, holidays, quality of work and of goods, prices, middlemen, fines, dues, etc. This compilation has been regarded as a landmark in the history of economics. BLANQUI devoted to it a chapter of his *Histoire de l'Economie Politique* (t. i., ch. xix., 3me ed. 1845), in which, however, he exaggerates the practical influence exercised by Boileau's book. As a repertory of economic police regulations it had, no doubt, great administrative utility. But its place is rather in the economics of history than in the history of economics.

The text of the *Livre des Métiers* was published at Paris in 1837 under the title of *Registres des Métiers et Marchandises de la ville de Paris*, 4to, edited by G.-B. Depping, in the series of *Documents inédits sur l'Histoire de France*. The best edition is that of MM. Lespinnasse and Bonnardot, forming part of the *Histoire générale de Paris*, of Baron Haussman (pub. 1886).

[See also article *Boyleau*, by Isambert in the *Nouvelle Biographie Générale*, Paris, 1855, vii. 194.] H. H.

BOISGUILLEBERT, *alias* BOISGUILBERT, PIERRE LE PESANT DE, born at Rouen, 1646, died in the same city, 1714. Few details of his life are known. He purchased, in 1690, a judicial office in the city where he was born. An economist and precursor of the PHYSIOCRATS, extremely energetic and persevering by nature, he laid bare, with courage and much practical good sense, the economic defects in the system which prevailed up to 1789. He attacked COLBERT with warmth, and not without reason, for having put agriculture on one side, and shackled the trade of corn. He proposed to Pontchartrain, CHAMILLART, and DESMARETS in succession reforms which are recognised as useful in our days, but he was not listened to, and was even exiled to Auvergne for his publications. His two principal works, *Le Détail de la France* (1695 or 1697), and *Le Factum de la France* (1707), are valuable from the evidence they supply as to the real economic condition of France during the most fatal part, the last thirty years, of the reign of Louis XIV. His complete works, omitting those of a purely literary character, appeared in 1707 (2 vols. in 12mo), under the generic title of *Détail de la France*; in the same year another edition, which appears to have appeared without the author's consent, was published in 2 vols. in 12mo, described as the *Testament politique de M. de Vauban*. Both of these are without the name of the author. These same works, omitting the *Traité du mérite et des lumières des grands financiers*, form part of the Collection Guillaumin (*Economistes financiers*

du XVIII. Siècle), with a preface and notes by M. Eug. DAIRE. All these works deserve to be read even in our days. A. C. F.

BOLLES, JOHN A., lawyer (born in Connecticut, 1809; died in Washington, 1878); he wrote *A Treatise on Usury and Usury Laws*, Boston, 1837, pp. 75, to show the mischief of the usury laws which generally prevailed in the United States at that time. The treatise contains a history and discussion of principles; the author expresses the fear that his argument will be regarded with prejudice and ill-will.

D. R. D.

BOLLMAN, JUSTUS ERICK, M.D. (born in Hanover, 1764). He took part in the French Revolution; was imprisoned in Austria, and became noted for his attempt to liberate Lafayette, also in prison in the same country. He afterwards emigrated to the United States, and became implicated in Aaron Burr's conspiracy. He remained in the United States for some years, then went to London, and died in the West Indies in 1821. While in the United States, in 1810, he wrote *Paragraphs on Banks and Banking*, Philadelphia, (pp. 122; 2d ed., 1881). In this he defended the United States Bank as a powerful agent for strengthening the government, cementing the union, and useful in diminishing and augmenting the circulating medium according to public necessities. The pamphlet is typical as illustrating the acrimony of the bank discussion. In 1816 he wrote *Plan of an Improved System of the Money Concerns of the Union*, Philadelphia (pp. 52); in which he again demonstrates the superiority of bank money to treasury notes; also *Strictures on the Theories of Mr. Ricardo*. The history of the greater portion of his life is narrated in *Justus Erick Bollman; Ein Lebensbild aus zwei Welttheilen*, by Friedrich Kapp, Berlin, 1880 (pp. 439).

D. R. D.

BON. A French word signifying a written authority to pay a certain sum of money, or to deliver a certain object or a certain quantity of goods for account of the person signing the authority. This is implied by the use of the words "*Bon pour*"—(e.g. *Bon pour* frs. 1000; *bon pour pain*, etc.) Such authorities, when issued by government officials on the national treasury, are called "*Bons sur le Trésor*." E. S.

BONÂ FIDE. Literally in good faith; the words are frequently used in connection with a substantive when their proper meaning is "genuine." A "bonâ fide traveller" is a man who is a genuine traveller; a "bonâ fide purchaser" is a genuine purchaser—not a person to whom a gift has been made in the form of a sale. The phrase "bonâ fide holder for value without notice" is used in connection with negotiable instruments. The Bill of Exchange Act has by § 29 substituted the shorter form "holder in due course." E. S.

BONA NOTABILIA. Formerly, if a deceased person at the time of his death left effects of such an amount as to be considered "notable goods" (fixed by the 93d canon of 1603 at £5), within a diocese other than that in which he died, the will was required to be proved or letters of administration taken out before the metropolitan of the province, and not before the ordinary of the diocese. The transfer of jurisdiction over wills to the court of probate by the 20 & 21 Vict. c. 77 has abolished the legal importance of *bona notabilia*.

[*The Law of Executors and Administrators*, by R. L. V. Williams and W. V. V. Williams, p. 292, 8th ed., London, 1879.—*Bona Notabilia*, by G. Lawton, London, 1825.] J. E. C. M.

BONA VACANTIA. The term applied in Roman law to the property of a deceased person which, if not claimed by the legal or equitable heir, went to the state, or in some cases to the municipality, or to the curia, or to the corporation of which the deceased was a member (see Hunter's *Roman Law*, p. 865). In English law the term is sometimes applied to things found without an apparent owner.

[Stephen's *Commentaries*, bk. iv. ch. vii.]

J. E. C. M.

BONCERF, PIERRE-FRANÇOIS, a French publicist, born about 1745 at Chasaulx, was employed by TURGOT, and published with his consent, under the assumed name of "Francaleu" a pamphlet: *Les inconvénients des droits féodaux*, 1776. In this he insists upon the freedom of landed property from any feudal impositions, and hopes the king will abolish them. But the author was discovered; the pamphlet was condemned by the parliament to be publicly burnt 23rd February 1776, and Boncerf himself was saved only by the king's intervention from being prosecuted. After the downfall of Turgot, Boncerf retired to Normandy and devoted himself to agricultural pursuits. He was secretary to the Duke of Orleans when the Revolution began; he was appointed a judge in 1790, but his sincerity led to his being brought before the revolutionary tribunal, and he escaped being condemned to death only by one vote. In consequence of these persecutions he died in 1794. In 1789 he had written *De la Nécessité et des Moyens d'occuper avantageusement tous les gros ouvriers*. The first creditors of the nation, he says, are the hands, which demand work and the soil that waits for the labour of the hands (p. 14). Boncerf proposes to give work to the labourers, for "everybody has a right to subsist, but this right supposes a duty—labour" (p. 59).

Boncerf's other writings are enumerated in the *Nouvelle Biographie*, t. vi. p. 554.—see L. de Lavergne, *Les Economistes français du 18e siècle*, 1870, p. 195. S. B.

BOND. Legal term for a deed by which a person (called the "obligor") declares himself

bound to another (called the "obligee") to pay a certain sum unless he performs an obligation specified in the same instrument by a clause called "the condition of the bond." Bonds are generally used when security is to be given to a public authority (bail bonds, security to keep the peace, security for costs in actions, etc.), and Contracts of GUARANTEE are frequently made out in that form, but instruments embodying mercantile contracts do not, as a general rule, assume the form of bonds. The word is also used for certain stock exchange securities, and in that sense is equivalent to "debenture" or "obligation," meaning a promise to repay a sum borrowed by the public authority or company who issues the security (with or without an additional premium), on a fixed date or on a date depending on the operation of a sinking fund (*i.e.* an annual sum to be applied in the purchase of bonds or in the compulsory redemption of some particular bonds, to be determined by ballot), and to pay interest at a certain rate on certain dates up to the time of repayment. Bonds are sometimes secured by a charge on special property (see also LLOYD'S BONDS). E. S.

BOND OF CAUTION (Scots law term). See CAUTION.

BOND OF CORROBORATION (Scots law). Bond given as further security.

BOND AND DISPOSITION INSECURITY. Scotch equivalent to mortgage.

BOND OF RELIEF (Scots law term). Bond of indemnity given to a surety.

BONDED WAREHOUSES. Warehouses in which articles are lodged under bond for the payment of any revenue duties chargeable thereon.

The payment of duties on taxable commodities at the time of importation or manufacture tends to increase the price paid for them by the consumer over and above that which the importer or manufacturer can afford to take, if the payment be deferred until the commodities are about to be taken into consumption. Interest on the money advanced must be charged, and the quantities on which the duty is paid will usually be in excess of those available for consumption, when allowance has been made for the waste arising from natural causes, and the various operations which the commodities undergo. Inasmuch also as a drawback of duty is ordinarily allowed on exportation, the payment of duty before the ultimate destination of the taxed commodities is known, involves an unnecessary expenditure of time and money in the case of goods intended for a foreign market, or of goods received for transshipment merely. To prevent these disadvantages, and at the same time to safeguard the revenue effectually, Sir R. WALPOLE, TURGOT, and Adam SMITH proposed at various times that warehouses should be established, either directly by the state, or

by private enterprise under state sanction, in which taxed commodities might be stored until required for delivery for home consumption, in which case the duty would then be paid, or until the goods were exported and transhipped, in which case they would be delivered free of duty. It was not, however, until 1848, when spirits intended for home consumption were allowed to be warehoused throughout the United Kingdom, that the system can be said to have been established in this country on a basis sufficiently wide to meet the legitimate requirements of trade. Between the years 1848 and 1880 the number of bonded warehouses was permitted to increase at a very rapid rate, and in the latter year it became evident that the cost of the supervising staff was in excess of the expenditure requisite for the benefit of the community as a whole. A committee of inquiry was accordingly appointed by Mr. Gladstone, the result of which has been to effect a considerable economy under this head, whilst at the same time the substantial advantages of the system are fully maintained.

In order to prevent the payment of duty on quantities in excess of the actual deliveries for consumption, certain specific allowances from the quantities warehoused are granted in respect of the natural waste arising from leakage or evaporation, and for the loss arising from processes to which the commodities are allowed to be subjected whilst still in warehouse. Amongst these processes are comprised the repacking and mixing of tea, the racking, vatting, mixing, and bottling of wines and spirits, the roasting of coffee, and the manufacture of certain descriptions of tobacco, and of certain preparations of that article for farm and horticultural purposes.

The following table shows the quantities of the principal articles remaining in bonded warehouses in the United Kingdom on the 31st March 1888 and 1890.

	1888.	1890.
Chicory	2,227,972 lb.	2,816,044 lb.
Coffee	18,796,688 „	18,801,220 „
Coffee	80,714,099 „	94,448,320 „
Dried Fruits	42,361,000 „	54,187,440 „
Spirits	38,763,770 pref. galls.	50,670,874 pref. galls.
Tea	108,882,907 lb.	190,488,411 lb.
Tobacco	127,204,706 „	137,249,104 „
Wine	7,002,625 galls.	7,562,712 galls.

T. H. F.

BONNET, VICTOR, born 1814, died 1889. A financial publicist, he became a counsellor of state and a member of the Institute. He wrote in the *Revue des Deux Mondes* from 1850 to 1884, in favour of the monopoly of a bank of circulation, a single standard (gold), indirect taxation, and a reduction of the expenses of the budget. His numerous articles in reviews and similar works have been the basis of the following publications. *Questions économiques et financières à propos des crises*, Paris, 1859, in 8vo. — *La Liberté des banques d'émission et le taux de l'intérêt*, Paris, 1864, in 8vo. — *Le crédit et les*

finances, Paris, 1865, in 8vo. — *Études d'économie politique et financière*, Paris, 1868, in 8vo. — *Études sur la monnaie*, Paris, 1870, in 8vo. — *Le crédit et les banques d'émission*, Paris, 1875. — *La question des impôts*, Paris, 1879.

A. C. F.

BONORUM POSSESSIO. The Roman law of inheritance, as derived from the xii. tables, was full of hardships and technicalities, and frequently caused inheritances to be forfeited to the state. To mitigate these evils the prætors introduced the "*bonorum possessio*," which conferred on the persons designated by them all the practical advantages of heirship, though they were not heirs in the strict sense. As, after the lapse of a year, the *bonorum possessor* acquired an indefeasible title, and in the meantime was protected by the equitable jurisdiction of the prætors, the difference was not important. The practical result of this procedure was that the formalities of testaments were relaxed, the law of intestate succession was made more humane and just, and various other reforms were introduced. The prætorian system of intestate succession was in its main principles embodied in the rules laid down by Justinian, which, with slight modifications, have been introduced in most European countries.

E. S.

BONUS. A bonus on shares is sometimes paid to proprietors as supplementary to the regular dividend, and is generally derived from undivided profits of former years, or from profits derived from exceptional transactions. It is often a difficult question to decide whether a bonus on shares belongs to a person having a life-interest, or whether it ought to be paid to the person ultimately entitled to the shares. Elaborate rules on this subject are laid down by the House of Lords. *Bouch v. Sproule*, *Law Reports*, 12 Appeal Cases, 385. The word bonus is also used by insurance companies to denote the additions made to the amounts of life policies at stated periods from accumulated profits reserved for the policy-holders.

A. F.

BOOK ACCOUNT CREDIT. As nearly all the large transactions of business in most civilised countries, and an increasing proportion of the smaller ones, are now settled through payment by cheque, the circulation consists to a great extent of entries in the books of bankers and traders, and the importance of these transactions is proportionally great. Credit is usually afforded through book-entry, the privilege of employing the capital of others being thus given in the manner most convenient to those who require the use of it.

BOOK-KEEPING, or the art of keeping accounts, has for its object a systematic record of transactions in money or in money's worth, designed to show the financial position of individuals (included in this term "individuals")

are all mercantile and other associations), both as regards themselves, and also in relation to others.

This object is carried into practice in all thorough systems of book-keeping on the lines of an unvarying principle called book-keeping by double entry, and which may be described as follows: There are two aspects in every transaction, as regards the person recording, which must be taken account of—its *origin* and *destination*; in some cases the terms cause and effect would be more applicable. This "taking account of" involves keeping an account in these two aspects. Now an account may be affected in two ways, there is the *debit* side and the *credit* side; a transaction may be chargeable against an account, *i.e.* be placed on the *debit* side, or it may be to the credit of an account, *i.e.* be placed on the *credit* side; for example, money received must be placed to the credit of an account in respect of its origin—the source from which it comes; and it must also be placed to the debit of an account in respect of its destination—the till, the cash-box, the bank, as the case may be, of the receiver. It will be seen that these two accounts are affected by this transaction in opposite directions. This rule invariably holds in every transaction. If in the one aspect it has to be placed to the credit of an account, in the other aspect it will have to be placed to the debit, and *vice versa*. Thus, in the record of any number of transactions the sum of the aggregate of the entries to the debit of the various accounts will equal the sum of the aggregate of the entries to the credit of the various accounts; and again, if only the balance between the debit and credit entries on each account be dealt with, the sum of the balances to the debit will equal the sum of the balances to the credit; but, as these balances are the combined outcome of the cause and effect of each and every transaction, they will represent the net result of the whole of the transactions recorded, and may be arranged so as to show not only the altered financial position brought about by these transactions, but also the various causes by means of which this result was obtained.

The methods used to carry out this principle vary with the nature and circumstances of the transactions, with questions of convenience, of detail, and with many other considerations.

The primary record of transactions is made in a book called the *Day Book* or journal.

The accounts of those transactions which are derived from this record are kept in a book called the *Ledger*.

A simple record of transactions as they occur *seriatim* would give a *Day Book* in its crude form. Applying method to such a record, the entries at once fall into natural groups; those relating to money received or paid may form a *Day Book* by themselves; such a *Day Book* is

called the *Cash Book*. Those relating to sales of goods may form a *Sold or Sales Day Book*; and again, records of purchases may form a *Bought or Purchases Day Book*, others, a *Bill Book*, and so on, with any variety of subdivisions desirable, but all springing from, and forming part of, the original *Day Book*.

In the same manner, the *Ledger* may be subdivided to suit convenience, such subdivisions being called by explanatory names, such as *Sold Ledger*, *Bought Ledger*, *Loan Ledger*, *Private Ledger*, etc.

Thus it will be seen that the *Day Book*, with its subdivisions, contains the materials from which the edifice, the *Ledger*, is built up.

The best systems of book-keeping are based on the application of the principle of double entry. Book-keeping by single entry would be better described as incomplete double entry; there is no practical system to which the term of single entry could be rightly applied. If a person takes stock of his assets and liabilities, and compares it with the stock taken at some previous date, he arrives at what may be termed a single entry balance sheet. He has before him the result at two different dates, and, by inference, can argue that, as his property has increased or decreased, such an alteration must have been caused by his having made so much profit or loss; but should he have made an error in taking stock of his property, such inference would be in error also; whereas by double entry, the steps by which such increase or decrease in his property was arrived at would be shown, and the result would be open to demonstration and proof.

Skill in book-keeping consists, not in forcing the record of transaction through any particular system, but in devising and selecting the methods best adapted to the general nature of the transactions to be recorded.

The omission of the keeping of proper business account books is regarded as misconduct under the bankruptcy law of this country (see *BANKRUPTCY LAW*). It is also punishable under the French commercial code. Though good book-keeping will not save an unsound business from ruin, it may be regarded as one of the principal corner stones in the edifice of commercial prosperity (see *BALANCE SHEET*).

[Among many books on this subject may be mentioned, *Book-keeping*, Hamilton & Ball, 1882. —*Double Entry Elucidated*, B. F. Foster, 1881.]

J. P.

A new method of book-keeping now used in Italy, whence many improvements in this art have already proceeded, is *Logismography* (from λογισμός and γράφειν) a system of keeping accounts, based on double entry, for which it is claimed that it is capable of a far more general application than any other as yet known, and can be applied equally to the domestic and commercial affairs of private individuals, to

the business of commercial and industrial societies, or to the budget and the accounts of the state. Logismography, invented by Giuseppe Cerboni, director of the department for government accounts in Italy, is taught in all the technical schools of the kingdom and in the three superior schools of commerce in Venice, Genoa, and Bari. It is applied in all the central departments of the state; besides a number of local departments (*e.g.* the provincial administration of Parma and the municipality of Reggio-Emilia) and of private societies (*e.g.* the popular bank of Parma and the "Omnibus" company of Florence). Logismography claims to be superior to any other method in the exactness and celerity of registration of the transactions recorded, and shows nearly *automatically* any error which may have taken place. It consists of four instruments called—

The Day-Book.	The Table of Accounts.
The Developments.	The First Draught.

The day-book is an account book kept on two pages: on the first are three columns, of which the first serves for the progressive *number* every transaction receives, the second one for the *description* of every transaction, the third one for the amount of every transaction in double entry; on the second (opposite) page there are two accounts in simple columns, as in the day-ledger book in the American system (see Fig. I.) The first of these accounts has the heading, *Owner of the business*, and has the cypher A; the second one has the heading, *Consignees and Correspondents*, and has the cypher B. At the end of these two accounts (to the right) is situated a column headed *Compensations and Permutations*.

The two accounts A and B must always balance each other, because the debit and credit of the one must always be equal for every single transaction, and their total sum must be equal to the debit and credit of the other one. On the credit side of A are inserted the sums representing the capital of the owner, and every increment it receives (gains, profits): on the debit side of B are registered the diminutions of the capital (losses, expenses, consumption). Sums indicating transactions giving no loss or gain,—buying or selling for ready money, exchanges, paying of bills of exchange,—are inscribed in the last column headed *compensations and permutations*, and are then transferred to the book described as developments (of B). The accounts of the day-book show at every moment the net capital of the owner; for this purpose the amounts have only to be totalled, and the debit subtracted from the credit in each account.

The second instrument, called *Developments*, consists of columns for the division and classification of the sums registered in the day-book. The first *Development* has the cypher A, and is called *Account of the Owner*. It consists (1) of

a column for the progressive number of every transaction; (2) of two columns called *Equivalence Columns*, because they are the reproduction of the account A of the day-book and contain the same sums it contains; (3) of a column called *Permutations*, and, lastly, of a number of accounts—generally ten or twelve—in simple columns, which *analyse* the account A (see Fig. II.) The sums inscribed in the credit column of the account of equivalences A must be retranscribed in *one*, or in *several* columns—after due subdivision—of the *Analytical Accounts*, viz. the series of accounts in simple columns following (to the right) upon the equivalence columns. The sums registered in the column of *Permutations* must be registered on *both* the credit and the debit side of the *Analytical Accounts*.

The second *Development* has the cypher B, and is called, "Account of the Consignees and Correspondents," and is disposed of in the same manner as the former development (see Fig. III.)

These developments (first and second) are called developments of *first degree*. Developments can be added of second, third, etc., degree. For example, in the B development (Fig. III.) there are the accounts for cash, for storehouse or magazine, for debtors, etc., which can be sub-developed. Supposing the account "storehouse" to be sub-developed, it would have the cypher B1, which would be repeated on a sub-development for storehouse, and might contain, say, the accounts cloth, cotton, silk; and if "cloth" were to be subdivided again, it would have the cypher B1a, and so on.

The completion of all the developments is the ledger.

The account which is sub-developed must always be repeated at the beginning of the sub-development, so that all the accounts are closely connected with each other. The ledger can be divided in two volumes: *Developments A* and *Developments B*.

The *Table of Accounts* is a statement which contains the index of all the accounts, disposed in such a fashion as to show how they are placed in the accounts of the single developments, and how a development of a certain degree depends on the development of superior degree (see Fig. IV.) The *Table* is the instrument by which an account is opened and headed, and the first draught is shaped, and shows the ramification of all the transactions. A *First Draught* is a paper on which a transaction is described with an indication of the developments, and the columns in which it has to be received.

Every transaction has its first draught (see Fig. V.)

Logismography renders a minute *division of labour* possible in the formation of first draughts, or in the registration in the day-book, and in

the different volumes of developments. Every registration runs in a horizontal line. By the first draught the capital is registered in the day-book, and credit or debit modifications in the developments.

The ascertaining the correctness of accounts is simple and rapid; the sums must be added in all the accounts, and the balance is registered in the usual way. In every development, therefore, the addition of all the debit balances and all the credit balances must be made, and the smaller of these sums is written down in the column of compensations, whilst the difference is registered in the first account (of equivalences) of the development. To close the accounts one must begin by the developments of highest degree and go back to those of first degree, and last to the day-book. The day-book for the accounts of the State is more complicated, and has more accounts in it than the one described; but the form of the developments and their arrangement is the same. In accounts concerning the finances of

the State, logismography receives an extension, and has an importance which can only be estimated by financiers, and could not be explained in so brief a description as this must necessarily be.

[*Bankers' Magazine*, June 1890.—For description of method, No. xvi. of the *Manuali Hoepli - Logismografia, Teorica ed Applicazioni*, by Celestino Chiesa, Urico Hoepli, Milan. For large works, *Trattato di Ragioneria*, by Gitti e Massa, Milan, *Trattato di Contabilità*, by Marchesini.] G. R.

BOOK OF RATES.
Up to 1558 POUNDAGE
was levied on the value

of the goods as sworn by the merchant. But in the year mentioned a book of rates was published that specified the values at which goods of different sorts were to be valued for custom duties. A new "book" was issued by Queen Elizabeth, 1586, in which the various commodities were stated in alphabetical order, with their values, and valued according to the real price. James I., after the decision in BATES'S CASE, issued a "book of rates" with the object not merely of rectifying values, but of increasing the impost. A new book was subsequently issued by Charles I. with the object "of better balancing of trade in relation to the impositions in foreign parts upon the native commodities of the kingdom."

J. E. C. M.

[See Dowell's *History of Taxation and Taxes in England*, 1889, vol. i.]

BOOM. A slang word, which originated in the United States, where it is used to describe a rise of prices in any speculative market, accompanied by excitement often running to excess.

A. E.

BOOTY. Moveables taken from the enemy on the field of battle or in storming a town. All booty belongs to the state in whose name and by whose authority it is made, the title becoming complete twenty-four hours after capture. Modern states have adopted regulations by which the whole or part of captured goods or their proceeds are distributed amongst those concerned in the capture. By the 3 & 4 Vict. c. 65, § 22, the sovereign may refer questions of booty to the judge of the prize court, now the court of admiralty. In the United States the president has, in the absence of any directions given by Congress, discretionary power. [International Law, by W. E. Hall, Oxford, 1889.]

BORNITZ, JACOB, was born (late in 16th century) at Torgau in Saxony, and lived afterwards at Schweidnitz in Silesia as imperial councillor. He appears to have possessed considerable influence with the Emperors Rudolf II. (1576-1612) and Matthias (1612-1619). He suffered much in the Thirty Years' War from the violence of the soldiery, who robbed him of his library. His economic writings are—(1) *De nummis in republica percutiendis et conservandis*, 1608; (2) *Aerarium, seu Tractatus politicus de aerario sacro, civili, militari, communi et sacratiori . . . conficiendo*, 1612; (3) *Tractatus politicus de rerum sufficientia in republica et civitate procuranda*, 1625. In the last of these he professes to give the results of observation and intercourse with artificers in his journeys through Holland, England, France, Italy, and Germany, treating his materials, however, not from the technical, but from the economic point of view. He was the first who did for Germany what MONTCHRETIEN de Watteville had done a few years earlier (1615) for France, namely, attempted to set forth with systematic completeness the economic

knowledge of his time, which he illustrated with much learning, though of a somewhat pedantic and uncritical kind, and with many facts derived from his own experience. He takes, says ROSCHER, in his half-barbarous period, a similar position to that of RAU in the later German economics. On the theory of money he has much that is sound and instructive; he strongly opposes any debasement of the currency. In the spirit of the MERCANTILE SYSTEM he favours extensive and even minute interference with private industry. He would prohibit the exportation of money, and would prevent, by means of SUMPTUARY LAWS, the introduction of costly foreign wares, whilst he would encourage the importation of raw materials (Roscher, *Gesch. der Nat. Oek. in Deutschland*, p. 184).

J. K. I.

BOROUGH. Originally a fortified place, now (1) a town having municipal institutions (see CORPORATIONS, MUNICIPAL), (2) a town sending representatives to parliament. As a general rule a municipal borough is at the same time also a parliamentary borough, but the area of the one does not always coincide with the area of the other.

E. S.

BOROUGH ENGLISH. A local custom prevailing in some boroughs according to which lands within the borough descend to the youngest son.

E. S.

BOSANQUET, CHARLES, governor of the South Sea Company and an eminent London merchant, was born in 1769 and died in 1850. He was the author of the following publications: (1) *A Letter on the proposition submitted to Government for taking the duty on muscovado sugar ad valorem*, probably written in 1806. (2) *A Letter to W. Manning, Esq., M.P., on the depreciation of West Indian property*, probably written in 1807. It considers more especially the trade in sugar and rum, as affected by the Navigation Act and other of our commercial regulations. (3) *Thoughts on the value to Great Britain of Commerce in general, and of the Colonial Trade in particular* (1807). This pamphlet was answered by William SPENCE in his *Radical cause of the present distress of the West India planters pointed out* (1807). (4) *Practical Observations on the Report of the Bullion Committee* (1810).

The last is by far the most important of Bosanquet's writings. The author uses the term "practical" because (he tells us) it is his belief that RICARDO's pamphlet (on *The High Price of Gold Bullion*), which had led the way in the bullion controversy, was "wholly theoretical"; and the report of the bullion committee itself was expressly brought under the same condemnation (see CANNING). Bosanquet contends that the bullion committee had laid two distinct and opposing views before parliament, the one "theoretical" and embodied in

their own report, the other "practical" and embodied in the evidence of the "practical" witnesses as given in the appendix to their report. Proceeding to details, he sums up the committee's views in the following six propositions: (1) The variations in exchange cannot for any length of time exceed the cost of transporting and insuring the precious metals; (2) the market price of gold bullion can never exceed the mint price unless the currency is depreciated below the value of gold; (3) so far as the custom-house returns of exports and imports go, the state of the exchanges ought at this time (1810) to be favourable and not unfavourable; (4) the bank, during the restriction, possesses the exclusive power of limiting the circulation of notes; (5) the circulation of country bank notes depends on the issues of the Bank of England; and (6) the paper currency of England is now (1810) depreciated in comparison with gold, and the high price of bullion and low rate of exchange are at once consequence and sign of the depreciation.

All these propositions are disputed by Bosanquet. He adduces, against the first, the state of the exchanges and the cost of transmission of specie in 1797, also between 1764 and 1768, 1775 and 1777, 1781 and 1783, and in 1804 and 1805. He considers that the facts show that there is no "natural limit" of any kind to the variations of exchange, and points to the Swedish exchanges which were then favourable, and to the premium on English paper which then prevailed in the United States of America. He attacks the other five propositions in a similar manner, though, in giving his views of the relation of the bank to the paper currency, he is fain to use "theoretical" reasonings from first principles, and even to appeal to the authority of Adam SMITH (*Wealth of Nations*, II. ii. 145, 1; M'Culloch's ed.) The "obvious and practical causes" of high prices are (he says) the recent vicissitudes of the corn trade and the increase in our taxation; to reach any other, the bullion committee have had to adopt wrong principles and then mis-state their facts. In "Supplementary Observations" annexed to the 2d ed. of his pamphlet, Bosanquet gives the committee some riddles to explain by their theory if they can, e.g. the fact that the exchanges, after being 6 per cent in our favour from 1790 to 1795, fell to 3 per cent below par in the next two years, though there had been no change in the bank's circulation and no suspension of cash payments. Ricardo deals with these *cruxes* and with the rest of Bosanquet's case in his own *Reply to Mr. Bosanquet's Observations*, with appendix, 1811. Bosanquet has an idea that the standard value of a pound note is the interest of £33:6:8 three per cent stock. This is an illustration of the danger experienced by those who, being conversant with details, believe that they thereby understand principles.

[M'Culloch's *Literature of Political Economy*, 1845, p. 174.—*Gentleman's Magazine*, 1850, new series, xxxiv. 325.—*Dictionary of National Biography*, art. "Bosanquet (Chas.)."—See BULLION COMMITTEE, HORNER, HUSKISSON, RICARDO.]

J. B.

BOSELLINI, CARLO (born at Modena, 1765, died 1823), published in 1813 in Modena a treatise on political economy in two volumes. Although the title of the book is *New Examination of the Sources of Private and Public Wealth*, it contains nothing which was new for its times, and does not seem to have had any particular success.

M. P.

BOSTON PORT BILL. Among the events leading to the revolt of the American colonies none is more famous than the attack upon the tea ships in Boston harbour (16th December 1773). This caused great indignation in England, where the parliament resolved to resort to coercive measures. A bill was introduced and carried in 1774 by which, after 1st June, the port of Boston was to be closed to all trade. No vessels might be loaded or unloaded in the harbour, and English men-of-war were sent to enforce the act, which was to remain in force until the EAST INDIA Company had been compensated for the destroyed tea and until the king in council was satisfied that peace and order was restored in Boston. This measure was bitterly resented in America, where the assembly of Virginia decreed that 1st June should be observed as a day of fasting and humiliation. The general sympathy with Boston was one of the prominent causes of the Congress at Philadelphia (September 1774), which marks the beginning of combined resistance to England.

[Mahon, *History of England*, vol. vi.—Lecky, *History of England*, vol. iii.]

R. L.

BOTERO, GIOVANNI, born 1540 at Bene in Piedmont, died 1617 at Turin. A powerful thinker, he opposed energetically the mercantilist theories, and enunciated the law of increase of population later known as MALTHUS's law. He occupied some of the highest official positions in his country.

His work, *Della ragione di Stato*, published for the first time in Venice in 1589, again there in 1619, and in Turin in 1596, has been translated into all the principal modern languages, and also into Latin. It was translated twice into French, once in 1599 by Choppins, *Raison et Gouvernement d'Etat*, and once in 1606 by Pierre de Deymier, *Maximes d'Etat militaires et politiques*. Not less remarkable is his book on the causes of the greatness of cities, *Delle cause della grandezza delle città*, published 1598 in Rome. Botero was an opponent of Macchiavelli. Having travelled a great deal, he published his so-called *Universal Reports*, a treatise on "The Strength of all the Powers of Europe and Asia," Rome, 1592 and 1595.

M. P.

BOTTOMRY, LOAN ON. A contract in writing in which the borrower recites the in-

tended voyage by a ship therein described, and the receipt of a loan upon condition that if the ship escape disasters at sea, or from enemies, or pirates, the lender is to receive back his advance with a stated sum for interest on completion of the voyage, but that the borrower is to be released from his obligation if the ship be lost or fall into the hands of enemies or pirates. The form of contract used is of time-honoured antiquity. It still closely resembles in its outlines those of a specimen extant in the speeches of Demosthenes. Traces of the loan on bottomry are also found in some of the most ancient codes of eastern nations. It finds a large place in the early sea laws and ordinances of the commercial nations and communities of Europe as well as in their legal literature. Down to very recent times it was the sole method by which the master of a vessel damaged by storms, or other hazards at sea, in some distant port removed from the ordinary channels of commerce and from any possible speedy means of communication with the owner of the vessel, could raise funds for the necessary repairs of his ship and the resumption of her voyage. All this, however, has been much changed of late years. The most distant corners of the globe have been knit as it were into one country by the economical revolution which science, and particularly telegraphy, have brought about, now enabling funds to be laid down almost immediately from and to the most widely separated places through the electric wire. This is fast rendering the loan on bottomry bill or bond obsolete in practice. The bottomry loan differed only from the ordinary loan on nautical interest of the Greeks and Romans in its good faith, as it required a pecuniary insurable interest to exist as the foundation of the contract, which the *FENUS NAUTICUM* did not, the latter being resorted to as a gambling or speculative wager by persons frequently not interested in the ship whose loss or safety was betted upon, a description of amateur underwriting by means of which the elder Cato and other wealthy Romans increased their fortunes. The loan on bottomry would seem to have furnished the ancient merchant and shipowner with an effectual form of marine insurance. In reality it supplied to the borrower not only a trading capital but also what was tantamount to a marine policy of insurance, with this peculiarity about it that he needed to be under no doubt about the solidity of the UNDERWRITER, as in this form of contract the policy money was already in the borrower's hands at the very inception of the transaction, and applicable to make good any losses from the perils of the sea in the event of a fair claim arising therefrom. On the other hand, to the lender and underwriter such contracts, so long as the special interest or premium was fixed at a high enough rate, afforded a profitable investment of funds on average, as there has always

existed a well-defined mercantile usage respecting such loans, generally including proper control by public registry, power to appoint a supercargo, and strict enforcement of other regulations in his favour. Neither did the pecuniary terms of such contracts present an obstacle to their habitual use. The net premium for sea-risk payable by the borrower, the shipowner, or merchant, was conditional on the vessel coming safely to port. It was only the difference between the extra rate allowed as nautical interest and the ordinary rate of interest on loan. The more modern system of marine insurance, in which the premium paid is merely the *pretium periculi* without being mixed up with a loan as in the case of the bottomry bill or bond contract, could scarcely in ancient days have been so conveniently circumstanced, as in the event of the disaster at sea, the underwriter might or might not be found equal to bear the burden of his bond. And the resources of ancient commerce were even equal to those instances in which the taking up of funds in this form was resorted to by those who had capital enough of their own. For these funds might be, and doubtless were, used for the relief of the borrower, who, when he did not require the whole advance for the ship's immediate purposes, could reinvest the balance in a temporary way with an *argentarius*, or banker, who allowed interest on its deposit at the common rate, and thus diminished the merchant's or shipowner's outlay to the bare differential rate of interest between what he borrowed and what he lent at. The balance thus resulting would be neither more nor less than the net premium of marine insurance, the whole system of which was inaugurated many centuries subsequently by a kind of commercial evolution (see INSURANCE, MARINE). F. H.

BOULAINVILLIERS, HENRI DE, a French writer, was born at Saint-Saire in Normandy in 1658, served some time in the army, but retired soon to his country seat, where he died in 1722. He was an admirer of FEUDALISM, and would have liked to restore "feudal liberty," the decay of which seemed to him the cause of the miseries of the people; but his chief merit lay in the frankness with which he laid bare the causes of the financial distress of France. His works on finance were not published till after his death. They were prohibited in France.

Boulainvilliers's works are as follows: *État de la France*, published in 1727-28, 3 vols. fol. This contains historical and descriptive accounts of all the provinces of France, extracts from the memoirs of the Intendants, and his own financial projects. The latter have been published separately under the title of *Mémoires présentés à Monseigneur le Duc D'Orléans, contenant les moyens de rendre ce Royaume très-puissant, et d'augmenter considérablement les revenus du Roy et du Peuple*. Par le Comte de Boulainvilliers.

2 vols. À La Haye et à Amsterdam, 1727. Among these the second memoir, directed against the "financiers" and proposing a state-treasurer's office, the third against arbitrary taxation, the fifth against the excessive salt-tax, the sixth against disorderly financial administration in general, are still of especial interest. His economic ideas (see pp. 215-225, vol. ii. of the last named work) are on the level of the ordinary mercantilism of the day. [*Nouvelle Biographie*, t. vi. p. 937; Montesquieu, *Esprit des Lois*, liv. xxx. ch. xi., Alphonse Galléry, *Les réformateurs de l'ancienne France*, Boulainvilliers, 1883. Charles Smith ascribes to him *Les intérêts de la France mal entendus*, 1756. But this work is written by Ange de Goudar (see *Three Tracts on the Corn Laws*, 1766, p. 161), Levasseur, *La Population Française*, 1889, p. 202, and Dr. Stephen Bauer in an article, "Zur Entstehung der Physiokratie," *Conrad's Jahrbücher für Nationalökonomie und Statistik*, N.F. bd. xxi. p. 151].
S. B.

BOUNTIES. A bounty is, in principle, something received by producers in addition to the price received from consumers through the ordinary operation of the market. In political economy the term is usually confined to such additions as are given by governments. We may distinguish (1) intentional bounties, designed to encourage export or to stimulate production; (2) unintentional bounties, begun unconsciously but afterwards recognised to be such, *e.g.* the sugar bounties of to-day; (3) virtual or disguised bounties, neither intended nor recognised, but actually operating as such; *e.g.* Great Britain's subsidies to the continental powers last century—which really stimulated her exports at her own expense, but were not designed to do so; endowments which enable learning and teaching to be obtained at less than actual cost price, prizes for inventions, and premiums of many kinds.

ADAM SMITH criticises them severely, and, after his usual manner, adduces detailed instances of their failure. RICARDO joins in the condemnation, but on somewhat different theoretical grounds; and he goes on to point out that Adam Smith failed to go far enough through confining himself to the case of supply not being affected in amount. The effect upon supply is, however, most important, and Ricardo shows that the increased supply necessitates, in the case of corn, recourse to less advantageous employment of capital, and so to increased prices and to a rise in the rent of land. Since the change in British industry from agricultural to manufacturing, it is necessary to dwell upon the working in manufactures of diminution of cost as amount of supply increases, and an important school of protectionists follow LIST, in recommending bounties as stimulants to this class of production only (List, *National Political Economy*, trans. S. S. Lloyd, London, 1885). Ricardo condemns bounties as the worst kind of taxation, because they not only raise a tax but

divert capital perniciously. Against this have to be set the considerations that a bounty is not lost to the nation which pays it; and it is often advocated in cases where there is an amount of capital or labour, or both, which cannot find employment otherwise. All petitions for bounties on the part of trades contain the assumption that capital and labour will be rendered inoperative unless assisted.

Many free-traders find justifications for bounties in order to obtain other objects than strictly economic ones, *e.g.* J. B. SAY, who inculcates free principles as the rule, justifies Louis XIV.'s bounties on shipping, their purpose being to raise a body of sailors, and the English bounties on refined sugar. He also declines to follow Adam Smith in his general rejection, so long as custom and legal restrictions interfere with the free investment of capital, and so long as artisans require training; and specifically commends "les sages encouragements" of COLBERT as having issued in the French silk industry. SISMONDI allows them for "sûreté" or "santé," and ROSCHER agrees that they may be useful in a transitional stage. J. S. MILL's remark (bk. v. ch. x.) that the bribing of customers is going beyond what any shopkeeper ever did, is neither accurate, as it is often done, nor profound, as a nation is shopkeeper, farmer, and manufacturer in one.

One advantage claimed specifically for bounties is that the amount drawn from the national purse is known, and it can be definitely accepted as a definite subsidy, as one of the expenses of national life for an end deemed desirable. Against this it is urged that the amount so raised does not measure the change caused. In the complications of modern industry there are no isolated changes; production and trade are disturbed, and it is because of the complication of effects that economic theory is not able to establish convincingly the limits of the effects produced. Again, the manifest simplicity of aiding industry by a dip into the national purse must be regarded as a disadvantage. The facility is a fatal one, until governments are found both honest enough and wise enough to resist the solicitations of particular industries. A special advantage is claimed for bounties on production, that there is nothing invidious in them as against foreign nations: they are free from the charges to which bounties on export and prohibitory duties are liable, in that they are purely domestic in intention; and, however justly a foreign nation may resent having our exports thrust upon it or its own produce kept off, it can hardly protest against our taking what measures we please to develop our power of supplying ourselves.

Recent history shows many examples in which the whole subject of bounties may be effectively studied. Adam Smith's caustic account of the *herring fishery bounties* (bk. iv. ch. v.) is

well followed up by M^CULLOCH (*Dict. of Commerce*), and their nugatory character appears to be demonstrated. The *linen bounty* affords another good example; CHAMBERS OF COMMERCE pleaded in vain for its continuance, and the event showed that on its suspension in 1834 export paused for a little while, but resumed its former volume in three years, and went on steadily increasing until 1848, after which it rushed forward under the impetus of the new industrial policy (see *Linen Trade, Ancient and Modern*, London, 1864, pp. 663-670). The *corn bounties* are thoroughly discussed by the English economists; their interest might again become actual if any foreign nations or colonies should choose to stimulate their corn exports; and a virtual bounty is claimed to be in operation in favour of the Indian producer through the fall in the value of silver in gold-using countries. An instance of a temporary bounty effecting its purpose in a way difficult to deprecate is found in a bounty on the export of engravings given soon after the founding of the Royal Academy (1769); of which it is said that it called a number of talents into action, e.g. Woollett, and attracted to London a crowd of foreigners, Cipriani, Kaufmann, Pastel, Moser, and Bartolozzi, and secured for English engraving a permanent place among the arts. (Cassell's *History of Engraving*, London, p. 236). Bounties on *shipbuilding and shipowning* have been in high favour with maritime countries for reasons of state. France at this time gives 1½ francs a ton for every thousand miles run by ships both built and owned in France, and half that premium for ships owned at home but built outside (see Fawcett, *Free Trade and Protection*, ch. ii.). The *bounties on sugar* have a complicated history—begun without this intention, their result has been to revolutionise the production of sugar by giving beetroot an advantage against cane which has issued in the former being now the larger source of supply (see BOUNTIES ON SUGAR). The bounty-giving countries expressed themselves unanimously in favour of abolition at the recent conference, provided that united action can be secured. Resistance is made by some English free-traders who regard the cheapness in England as the primary advantage; and an obstacle is interposed by the refusal of the United States to enter into any undertaking not to begin a bounty system. The foreign office (see statement by under-secretary in parliament) knows of only the following “considerable” bounties in operation in 1889: on shipping, on sugar, and on the Newfoundland fisheries (French).

The employment of a bounty by the state may be justified as a measure of equity when industries are affected by the action of state. When, for example, a treaty of commerce or a general change of state policy alters suddenly the industrial situation, there may be some

claim on the part of the owners of fixed capital and the persons in whom there is fixed skill, for some supplement to the lowered market-price which will allow their industry to diminish or die away gradually. But bounties are artificial interferences with production, in the same sense that protective duties are, from an opposite point of view. A bounty has been happily called a negative tax (see BOUNTIES, ABSTRACT THEORY OF).

The question is discussed more or less in all the standard works on political economy, and the history of various bounties is given in the commercial histories and parliamentary papers relating to the different trades. A. C.

BOUNTIES, ABSTRACT THEORY OF. The theoretical inquiry whether a country can possibly benefit itself by a bounty, may be subdivided according as the arrangement considered is only temporary or more enduring. (1) The arguments, by which MILL, in a well-known passage (*Pol. Econ.*, bk. v. ch. x. § 1), defends temporary protection of nascent industries seem applicable, *mutatis mutandis*, to bounties as well as to duties. The same may be said of the considerations in favour of temporary protection, adduced by Dr. Sidgwick in his *Political Economy* (bk. iii. ch. v. § 1), and his *Method and Scope of Political Economy* (pp. 1-20). (2) The arguments on the side of a less transitory bounty are more abstract. Cournot argues that a bounty to a monopolist might possibly cause greater gain to consumers than loss to the treasury (*Recherches* . . . 1838; ch. vi.). In this reasoning Cournot takes no account of those consumers, who are induced by the fall of price to increase their purchases. But of course, when this circumstance is taken into account, the argument in favour of a bounty becomes *a fortiori*. The omission, however, seems fatal to the arguments, which, in the case of free competition, Cournot has urged in favour of protecting duties and bounties (*Ibid.*, chs. x.-xii. and see M. Bertrand's criticisms in the *Journal des Savans* for 1883). Some presumption is perhaps derivable from Cournot's principle that a “bounty is in algebraic language a negative tax, so that the same formulæ should apply to a tax and bounty”; taken in connection with the proposition admitted by many economists that it is possible for a country to benefit itself at the expense of foreigners, by a duty on imports or exports, in certain cases. Such a case is stated by Mill (*Pol. Econ.*, bk. v. ch. iv. § 6, beginning), and more simply by Dr. Sidgwick in the following passage: “Suppose that a 5 per cent duty is imposed on foreign silks, and that in consequence, after a certain interval, half the silks consumed are the product of native industry, and that the price of the whole has risen 2½ per cent. It is obvious that, under these circumstances, the other half which comes from abroad yields the state 5 per cent, while the tax levied from the con-

sumers on the whole is only $2\frac{1}{2}$ per cent; so that the nation in the aggregate is at this time losing nothing by protection, except the cost of collecting the tax, while a loss equivalent to the whole tax falls on the foreign producers" (*Pol. Econ.*, bk. iii. ch. v. § 2, and context). It seems possible to imagine a converse case, in which a bounty would not be detrimental to "the nation in the aggregate." Professor Marshall argues (*Principles of Economics*, bk. v. ch. vii.) "that it might even be for the advantage of the community that the government should levy taxes on commodities which obey the law of diminishing return, and spend part of the proceeds on bounties to commodities which obey the law of increasing return."

Such speculative considerations are not inconsistent with a firm adherence to the practical principle of free trade. Thus Dr. Sidgwick, while he regards it as "erroneous to maintain, on the ordinary economic grounds, that temporary protection must always be detrimental to the protecting country," does not therefore accept the practical conclusion which that remark seems to favour. A decisive consideration against it is that no government is wise enough to discern in what cases protection would not be detrimental, or strong enough to confine itself to those cases (*Method and Scope*, p. 19). It may be added that refined arguments on the side of protection are useful as correctives to exaggerations of the case on the other side. It behoves not to accept even right conclusions with more confidence than they deserve. It is dangerous to exaggerate the preponderance of evidence in favour of what we believe. The balance of judgment may suffer a strain which will be felt on some other occasion where nice estimation is required. Thus Adam SMITH's contention that a bounty on corn cannot be beneficial, because "the nature of things has stamped upon corn a real value" (*Wealth of Nations*, bk. iv. ch. v.), is of little moment as an addition to the weighty practical considerations in favour of free trade; while it is apt to distort the judgment on the delicate questions connected with a MEASURE OF VALUE. F. Y. E.

BOUNTIES ON SUGAR. The operation of bounties is best illustrated by a practical example, such as the sugar bounties give. France, Austria, and Germany supply collectively rather more than two-thirds of the total sugar production of Europe, at the present date (1890). Each of these countries grants bounties on export; Austria openly, limiting, however, the amount to be spent under this head; Germany and France (who have long had bounties) in a more indirect but quite as effective way. These two, Germany for half a century and France since 1884, have adopted the system of levying duties on home-produced sugar on the weight of the beetroot when delivered for manufacture. Even if established

with a purely fiscal object, this system is open to the objection that it is only based on the probable average saccharine richness of the root, making no allowance for increased or reduced yield caused by varying meteorological and agricultural circumstances.

It had been admitted in Germany in 1840 that 20 centners of roots would give 1 centner of raw sugar. Thirty years later the proportions of 12·5 to 1 had been reached. Notwithstanding the more stringent fiscal legislation which ensued, the factories continued to spread wonderfully, and the production of sugar trebled between 1877 and 1884. From 1875 to 1884 the annual exports had increased in an almost fabulous proportion.

About this time, although protected by a *Sur-taxe* on foreign sugar, the French manufacture rather declined; the annual production had remained stationary, but on foreign markets France was beaten by German competition, and the exports had fallen from 327,000 to 184,000 tons.

Assailed by clamours of distress, the French ministry resolved in 1884 to apply the system which, as German economists boasted, had in their country performed an "educational mission" (*eine erziehende Mission* as it is called in Schönberg's *Handbuch der Politischen Oekonomie*, article "Zuckersteuer"). The French minister of finance declared that the proposed law would act as a law of progress, stimulating the improvement of agriculture, the adoption of improved machinery, and consequently ensuring a considerable increase of the quantities of sugar extracted. Up to 1st September 1887 the factories were allowed an option between the old and the new system, but, after that date the duty was to be uniform, imposed on the basis of a legal yield of 6 kil. 250 of refined sugar for 100 kil. of roots, and this percentage was to be gradually increased, so as to reach 7 kil. in the present year (1890).

It cannot be denied that what had been stated to be the principal object of the law of 1887 has been fully realised. Everywhere the "fabricants" have abandoned the antiquated process of extraction by presses for the more exhaustive system of *diffusion*. To reconcile their own interests with those of the farmers, they have supplied the latter with seeds of richer and less bulky varieties of beetroot, and have agreed to pay higher prices for higher saccharine degree. More land (about 200,000 instead of 120,000 hectares) is now employed for this cultivation, and as beetroot affords the opportunity of a better rotation of crops, it promotes the growing of wheat, that favourite of French farmers and landowners.

In Germany the task of the revenue officers ends with registering the weight of the roots. In France they are instructed to keep a strict control over the whole fabrication and an account of the sugar, raw or refined, which

leaves the factory. Government is thus enabled to ascertain if a surplus is obtained which remains "duty free" at the disposal of the manufacturer. It has thus been found that during the three years since the law was passed the *real* extraction has amounted to 7·27, 8·12 and 8·87 per cent, and that the quantities of duty free sugar have amounted respectively to 22·56, 31·21 and 36·44 per cent of the whole French production. The treasury had been a loser by 25, 43, and 92 million francs (say £1,000,000, £1,720,000, and £3,680,000 sterling) in bounties to manufacturers and refiners (*Bulletin de Statistique*, January 1888). To counteract this drain the legal yield was raised so as now to reach 7 kil. 750; moreover a special duty of 30 fr. (say £1 : 4s.)—the ordinary duty being 60 fr. (say £2 : 8s.)—is imposed on the surplus sugar. In Germany the legal yield had already been increased in 1883, and the drawback has since been lowered by about 5 per cent.

Although the joint production of France and Germany is double that of ten years ago, there has only been a temporary reduction of price for the French consumer of loaf sugar (96 and 98 frs., say £3 : 16 : 9 and £3 : 18 : 4, per 100 kil. in 1886 and 1887); at present, as in 1884, it again costs him 104 frs. (say £4 : 3 : 2). The foreign purchaser alone has beyond question gained, and the staunchest supporters of the factories confess that England obtains French sugar 6 frs. (say 5s.) per 100 kil. cheaper than it can be purchased in France. Only they shift the responsibility on the bounties enjoyed by the French refiners, these rival brothers of the "fabricants" (Poullin, *L'Impôt sur les Raffineurs*, Paris, 1890). As the refiners will, however, henceforward be subject to the constant supervision of the officers (*coercive*) and have to pay the duties on the manufactured produce, there will not be much left of disguised bounties for them. In fact the system of the *impôt à la consommation* or *Fabrikatsteuer*, already adopted in Austria and Russia, alone gives all parties concerned a clear insight in this maze of conflicting interests. Bounties might still exist, as in Austria, but it would be known to what extent. With the actual French and German system, it is impossible to determine beforehand the amount of bounty which will be awarded; this varies almost in every case, according to the soil, the accidents of the season, and the skill and industry of the manufacturer.

[The *Liste Générale des Fabricants de Sucre*, Paris, gives a compendium of the legislation in France and other countries. No special book, up to date, on the subject can well be named, which can only be studied in the files of special papers, as *Le Journal des Fabricants de Sucre*, *La Sucrierie Indigène*, Licht's German Reports; all these, however, are written with a strong bias. See also Sir T. H. Farrer, *Free Trade cereals &c.* E. ca.]

The German Reichstag has recently (May 1891) voted a law doing away with the system of taxation according to the weight of the beet roots. In future the duty will be levied on the quantities of sugar produced. Direct premiums of 1·25 to 2 marks (say 1s. 3d. to 2s.) will be allowed during 5 years on every 100 kil. exported, the duty being 18 marks (say 18s.) per 100 kil.

BOURGEOIS (Fr.) was no doubt originally citizen of a town in the wide sense, but (unlike *citoyen*) it has been constantly narrowed into a term of disparagement. So it means commoner as opposed to noble ("Bourgeois Gentilhomme," in Molière's comedy of 1670, is really a playful union of opposites), civilian as opposed to military, rude as opposed to refined. At present in the language of social agitation it means employer (patron) as opposed to workman (ouvrier); and the title Citizen King, on which Louis Philippe prided himself, would now be no compliment, simply king of the middle classes. So in the discussions of the Miners' Congress at Paris, 1891, in regard to the proposed general strike: "la bourgeoisie vous pousse à la faire, parce qu'elle est préparée à ce moment" (report in *Le Temps*, 3d April 1891). J. B.

BOURSE. A French word for—(1) The meetings of bankers and merchants for the transaction of business; (2) the place where such meetings are held. The French Code de Commerce defines the Bourse de Commerce as the meeting of merchants, masters of vessels, stock and bill brokers (agents de change), and merchandise brokers (courtiers), which is held under the authority of the government (Code de Commerce, § 71). The same definition may be given to this word and its etymological equivalents (*bourse*, *borsa*, *bolsa*, etc.) in most countries if we omit the government authority, which is generally unnecessary. The word used in the sense referred to is in all cases also used for the place of meeting. As to England, see CHANGE. E. S.

BOURSE DU TRAVAIL, a labour exchange, or registry, for the use of persons offering or seeking employment. There is at present a workmen's movement in France and Belgium for the extensive establishment and intercommunication of such institutions, which have long been advocated by M. de Molinari. The municipal council of Paris voted 1,200,000 francs (£48,000) to found a *bourse du travail*, which was installed on 20th June 1887, at 35 Rue Jean-Jacques Rousseau, Paris, pending the transformation of the old corn market. The administration consists of workmen chosen by different trade-unions. Employers are not represented. Some irritation exists as to the exclusion of several workmen's associations. The bourse, it is alleged, is confined to a clique. But it is too soon as yet to pronounce upon its working. *Bourses du travail* have been formed at Nîmes, St. Etienne, Marseilles, and a few other places in the provinces of France. H. H.

BOWEN, FRANCIS, born 1811, died 1890; he graduated from Harvard College in 1833; was instructor there from 1833 to 1847, and professor in Harvard University from 1853 to 1889. Professor Bowen's interests and attainments were great and varied. He wrote not only on economic topics, but on history, politics, the classics, and most of all on the subject connected with his professorship—philosophy. He was editor of the *North American Review* from 1843 to 1854, and in that capacity, as well as in independent publications, gave the fruits of a vigorous intellect and a remarkable industry. His economic writings in the main are in the nature of text-books, stating and illustrating the doctrines of the classic economists. But on the subject of international trade he diverged, and reasoned in favour of the doctrine of protection. He laid stress on the need of national independence, and of aiding young industries; and he made application also of MILL's reasoning as to the possible effects of duties on the play of international demand. On this subject, as on all he touched, he was clear, positive, and effective, and his reasoning is much above the level of that usually adduced against the principle of free trade.

The larger writings of F. Bowen on economics were: *Principles of Political Economy*, Boston, 1856; *American Political Economy*, New York, 1870.

BOXHORN, MARCUS ZOBRIUS, born 1602 (or 1612) at Bergen-op-Zoom (North Brabant), was professor of rhetoric at the university of Leyden, 1632; professor of history there, 1645; and died 1653. He wrote no books exclusively on economics, but dealt with economic subjects in the following works:—

1st, *Institutiones politicae*, Lipsiae, 1650; following editions (Hague Comitit, 1668, Utrecht, 1702).—*Cum Commentariis et notis et observationibus Georgij Horstii* (his successor at the university).—2d, *Disquisitiones politicae, s.e. 60 casus politici ex omni historia selecti* (Hague Comitit, 1650).—3d, *Commentariolus de Statu confederationum provinciarum Belgii* (2d. ed. 1659), and an extract of it: *Reipublica Batavica brevis et accurata descriptio*.—In a special work, *Dissertatio de Prospectis, vulgo Longobardis, qui in federato Belgio Menas famulos exercent* (Lugd. Bat. 1640), Boxhorn treated the question of interest. According to him a principal duty of government is the promoting of industry, not only by indirect ways (*privilegiis, itinerum securitate*, etc.), but by direct ones too, guilds preventing merchandise from deteriorating, and therefore trade from declining. A well-regulated currency is also of extreme importance. His ideas on taxes are, considering his date, remarkable. Taxes should be levied conveniently, ought to be proportionate to the wealth of the contributors, and may be used as a means even to promote morality. They should never be imposed on articles of export except on those nowhere else obtainable.

A. F. V. L.

BOYCOTTING, an expression of recent

origin, and derived from the name of Captain Boycott, who was the first known person subjected to the treatment indicated by it. Captain Boycott (the name is sometimes written Boyceatt) was, in 1880, living at Lough Mask House, County Mayo, as land agent to Lord Erne, an Irish nobleman. The circumstances which gave rise to the term occurred during the land agitation of 1880-1881. A boycotted person is cut off from all intercourse with his neighbours; nobody is allowed to take his land, to work for him, to supply him with goods, or to help or assist him in any way. This treatment has in many districts of Ireland been applied to landlords, who, in the opinion of the agrarian association by which it is directed, have been harsh to their tenants; or to persons who have taken farms the former tenants of which had been evicted; or generally to persons who in their dealings with landlords have not conformed to the instructions laid down by the association to the farmer of which the tenant farmers of the district submit. Persons who continue to accept or induce any one to take part in the process of boycotting may under the general criminal law be subject to a prosecution for conspiracy, and, in so far as this is the case, they may in a district proclaimed under the Criminal Law and Procedure (Ireland) Act, 1897, be tried by a court of summary jurisdiction (20 & 21 Vict. c. 90 § 2 [1]).

[The word boycotting is now frequently used in a wider sense, meaning simply excluding, holding aloof from, and in that sense it has also been introduced into foreign languages (German, *boykottieren*; French, *boykotter*). For the boycott in America see article, *Encyclopædia Journal*, vol. 2, No. 1. *The Boycott as an Element in Trade Disputes*, by John Burnell.]

E. S.

BRADLAUGH, CHARLES (born 1833, died 1891). Bradlaugh was best known as a radical reformer, secularist, and non-Malthusian. But towards the end of his life, when he was allowed to take his seat in the House of Commons for Northampton, and his force of intellect received fair scope, he confined himself mainly to political work, and especially to questions affecting labour, finance, and Indian government. Though he never read for the bar, he had a wide and accurate knowledge of law; and, throughout his whole career as an agitator, he always (like CORBETT) strove to keep every movement in which he was concerned within the bounds of strict legality. He was a staunch free-trader and individualist; and his latest published writing was in opposition to the proposal for a legal restriction of the hours of adult labour.

J. B.

BRANDS AND OTHER CERTIFICATES OF QUALITY, GOVERNMENT. The most important case in which the British government gives a guarantee of the quality of an article of

commerce is that of the crown brand on barrels of herrings cured in Scotland. Till 1830 a bounty was paid on barrels which were branded as coming up to a certain standard of quality, and after the bounty was abolished the practice of branding barrels which reached the standard continued. In 1856 Messrs. Bonamy Price and F. St. John, and Capt. B. J. Sullivan, were commissioned to inquire whether it would be better to abolish the brand or charge a fee for it, as the Treasury was no longer willing to pay for the inspection which it involved. Messrs. Price and St. John (Captain Sullivan dissenting) recommended that it should be maintained and 4d. a barrel charged for it. This plan was adopted. In 1881 a committee of the House of Commons made an exhaustive inquiry as to its effects, and by a large majority reported in favour of maintaining it. Opponents of the brand say that it is inimical to improvements in curing, that it encourages speculation, and that, though it affords no real guarantee, curers are obliged to apply for it by the unfounded prejudices of their continental customers, which would necessarily disappear with its abolition. Its supporters maintain that it enables small and little-known curers to compete with great houses, and prevents frauds, and they add that as application for the brand is purely voluntary, branding would fall into disuse if it were really of no value.

The arrangements of the Cork butter market necessitate the testing and branding of butter by an official inspector, a system condemned by the royal commission on agriculture in 1881. Under acts of parliament passed in 1864, 1871, and 1874, all chain-cables and anchors sold for British ships have to undergo an official test and obtain the official stamp. Gun barrels are subject to similar regulations, and many gold and silver articles cannot legally be sold without the hall mark. In all ordinary cases the buyers are obviously the best judges of the kind of commodity they want, and their demand suffices to cause its production and in many cases its progressive improvement in quality. "CAVEAT EMPTOR (*q.v.*) is the sound general rule economically and socially as well as legally" (Farrer, *State in Relation to Trade*, p. 150). A government certificate is likely to be of value only when it certifies to quite definite facts which are not easily ascertainable by the buyers. It is admitted by nearly every one to be useful in the case of coins, which are pieces of metal certified by a government stamp to be of a certain weight and quality.

(See ADMINISTRATION ; CONDITIONING ; LAISSEZ FAIRE.)

[Report on the Fishery Board of Scotland, Parl. Papers, 1857 (65 Sess. 1), xv. 39.—Report on Herring Brand (Scotland), Parl. Papers, 1881, 293, ix. 1.—T. H. Farrer, *The State in Relation to Trade*, pp. 145 to 151.—J. S. Mill, *Principles of Political Economy*, bk. v. ch. xi. §§ 7 and 8.]

E. C.

BRASSAGE. A charge made for coining, sometimes called a seigneurage. The word means "strictly the stirring in the furnace of the molten metals, and next the allowance made to the individual by whom the operations of coining were farmed" (Paper by J. B. Martin "Seigneurage and Mint Charges" (*Journal, Institute of Bankers*, April, 1884). No charges of this description are made at the royal mint in England, though they are made at the branches of the mint at Sydney and Melbourne (see MINT). In England the Bank of England, by arrangement with the government, buys gold at £3 : 17 : 9 per standard ounce, and sells again at £3 : 17 : 10½. In France, a charge exists of 6·70 frs. per kilo (= ·0025) equivalent to about ¾d. per £ sterling, the corresponding expense in England, covered by the arrangement made with the bank named above, being estimated at 1½d. per £. The advisability, or otherwise, of making such a charge appears to be an open question which can best be decided by those immediately concerned.

["Seigneurage and Mint Charges," by J. B. Martin, *Journal of the Institute of Bankers*, April 1884.—*Seigniorage and Charge for Coining*, Ernest Seyd, 1868.—*Arbitrages et Parités*, Ott. Haupt, 1883.—*Report, International Coinage Commission*, 1868.—*Mint Reports*, etc.]

BRASSEY, THOMAS (1805-1870), born in Cheshire, where his family had flourished for six centuries, illustrated an ancient house by his distinguished success in the new calling of railway contractor. In his dealings with labourers in different parts of the world—employing the English navy at 3s. 6d., the Indian coolie at 6d. a day—Brassey had an unrivalled opportunity of verifying the truth that the cost of labour to the employer is not proportioned to the amount of daily wages. He is even said to have found "that for the same sum of money the same amount of work was everywhere performed" (*Work and Wages*, by Mr. Thomas (now Lord) Brassey, ch. iii. ; *Life and Labours of Mr. Brassey*, by Sir Arthur Helps, ch. v., end). But this proposition, understood exactly, is not only, as Cairnes points out (*Leading Principles*, pt. ii. ch. iii. § 7) *a priori* improbable, but inconsistent with several of Brassey's experiences. With respect to many other questions, the comparative efficiency of labour in different countries, the effect of short hours on efficiency, the alleged deterioration of the labourer—the experiences of Brassey recorded by his son in the work referred to are valuable to the economist. Mr. Frederick Harrison's interpretation of the facts stated by Lord Brassey is remarkable (Review of *Work and Wages* in the *Fortnightly Review* for 1872).

[For the particulars of Brassey's noble and beneficent life, see Sir Arthur Helps's *Life and Labours of Mr. Brassey*.]

F. Y. E.

BRAY, CHARLES (1811-1884) born at Coventry, was a ribbon manufacturer in that city, but

retired from that business in 1856. From his youth upwards Bray had been active in social and educational reforms; and in his principal work he proceeded on the lines of OWEN and CARLYLE, advocating CO-OPERATION and organisation of labour against COMPETITION.

See the 2d vol. of *The Philosophy of Necessity; or, The Law of Consequences, as applicable to Mental, Moral, and Social Science*, by Charles Bray, London, 1841, pp. 301-389, 2d ed. 1863, 3d, 1889. The appendix to this work has been published separately in 1844 (*An Outline of the various Social Systems and Communities which have been founded on the Principle of Co-operation*); this was written by his sister-in-law, Mary Hennell (d. 1843), and gives valuable information on socialistic doctrines in England. Bray's other works concerning social economy are: *Address to the Working Classes on the Education of the Body*, 1837 (see his autobiography, *Phases of Opinion and Experience during a Long Life*, 1884, ch. vi. and vii.) *An Essay upon the Union of Agriculture and Manufactures, and upon the Organisation of Industry*, 1844, and two papers read before the British Association for the Advancement of Social Science, October 1857: *The Industrial Employment of Women*, and *The Income of the Kingdom, and the Mode of its Distribution*, in which he computes that one-seventh of the population possess two-thirds of the annual income.

[Holyoake, *The History of Co-operation in England*, 1875, vol. i. p. 17, 329n.—A. Menger, *Das Recht auf den vollen Arbeitsertrag*, 1886, p. 58.] S. B.

BRAY, J. F., early in 19th century, is the author of *Labour's Wrongs and Labour's Remedy; or, the Age of Might and the Age of Right*, Leeds, 1839. He was a follower of OWEN and Thomson; his book tries to prove "that all those who perform equality of labour ought likewise to receive equality of reward" (p. 30), and though he admits that even this does not involve perfect justice, that "such equality is infinitely more just than the mode of rewarding labour under the present system" (p. 206). Impressed by the modern growth of joint-stock companies, Bray proposes a "joint-stock modification of society, admitting of individual property in productions in connection with a common property in productive powers" (p. 194), and proposes a paper and pottery currency, whose foundation is labour, in order "to secure the public against any other variations in the value of the currency than those to which the standard itself is subject" (pp. 143, 198). This book is, notwithstanding all illusions, written in a remarkably lively style.

[Holyoake, *The History of Co-operation in England*, 1875, vol. i. p. 224.—A. Menger, *Das Recht auf den vollen Arbeitsertrag*, 1886, pp. 58, 94 (corrects the statements given in K. Marx, *La misère de la Philosophie*, 1847, p. 62).] S. B.

In Bray's work, mentioned above, *Labour's Wrongs and Labour's Remedy, or the Age*

of Might and the Age of Right (Leeds, 1839), the current economical doctrines were examined with acuteness and force, and were said to involve "that under the present system there is no hope for the working man." At present (Bray considers) no political or fiscal reforms, and no TRADES UNIONS or SAVINGS BANKS, will permanently lessen poverty. So long as property, whether in land or in the instruments of production, remains as it is, one man's gain is another man's loss; the only way to be rich is to seize the fruits of another man's labour; and the only permanent remedy is a complete overturning of the present system and an organising of production by the community itself. In place of individual employers would come groups of joint-stock companies under general and local boards of trade. All men would be workers, and would receive "the whole fruits of their labour." The labour necessary to life would gradually fall from 8 or 10 hours a day to 5 hours, production being immensely increased by the new system, and being likely to keep ahead of population "for thousands of years." Among writers of his school Bray deserves more recognition than he usually obtains. His errors of theory (such as the confusion of value with cost) are not peculiar to him, but are shared by Karl MARX and (generally speaking) the Ricardian school of socialists.

J. B.

BREACH OF TRUST (Scots criminal law term). Fraudulent appropriation by trustee, or failure in duty by official, etc.

BREACH OF TRUST. Any act or omission on the part of a trustee violating the conditions of the trust or the rules of law concerning the investment or administration of trust property. The liability of trustees for breach of trust is a very stringent one, but the Trustee Act 1888 (51 & 52 Vict. c. 59) has relaxed it to a certain extent. It is, for instance, the rule that advances on mortgage of freehold property must not exceed two-thirds of the value of the mortgaged property. According to the former law trustees having once gone beyond the limit were liable for whatever loss might subsequently have been incurred; since the date of the new act they cannot be called upon to replace more than the difference between the amount which they would have been authorised to advance and the amount actually lent. The trustees are also placed in a more favourable position with regard to unauthorised investments made at the request or with the consent of a beneficiary. In the case of express trusts the trustees were not authorised to plead any statute of LIMITATIONS, but they may now, in the absence of fraud or misappropriation, rely on the statute.

E. S.

BRECK, SAMUEL, was born in 1771 in Boston and afterwards settled in Philadelphia. He wrote in 1843 a small pamphlet, *Historical Sketch*

of *Continental Paper Money*, Philadelphia, pp. 40. In this he attempts to demonstrate that the non-redemption of the paper money after the revolution acted as a moderate tax by reason of its gradual depreciation, and that the issue was not so unfortunate as is generally claimed. Throughout his life—in congress and in private—he took a decided stand in favour of internal improvements. For details see *Memoir* by J. Francis Fisher, Philadelphia, 1863, pp. 45.

D. R. D.

BREHON LAW. The Brehons were a hereditary class of judges in Ireland, to whom disputes were referred for arbitration, and whose decisions were regarded as binding, though there was no sanction to enforce them. It is probable, though by no means certain, that the Brehons were descended from the earlier Druids, who lost their priestly functions on the introduction of Christianity, but retained their judicial power. The decisions of the Brehons formed a vast mass of customary law, a knowledge of which was the exclusive property of the class. Gradually this law was reduced to writing, and has been preserved to us in the *Senchus Mor* and the *Book of Aicill*, which have been published in the Irish Rolls Series.

The Brehon law throws great light on the important part played by consanguinity in the formation of society. The unit of the social system in Ireland was the *tuath* or tribe, consisting of the real or supposed descendants of a common ancestor. The tribe owned a district of land, which was unequally distributed for occupation among its free members. Rank, originally a matter of birth, had come to depend mainly upon wealth, and wealth was estimated not in land but in cattle. The authority of the tribal chief belonged to him, not as lord of the land, but because he supplied cattle to the poorer occupiers of tribal land. For this grant the recipient had to pay a rent either in kind or in service. The more cattle belonged to a *flaith*, or noble, the larger number of retainers could he possess, and the higher was his social position. The lowest freeman was the *oc-aire*, who possessed a cottage, and a right over the common pasture. If he could acquire ten cows he rose to the rank of *bo-aire*, or cow possessor. As time went on the nobles gradually seized the unoccupied portions of the tribal land, and the idea of private property supplanted the earlier theory of joint ownership.

But a clear trace of the latter survived in the rule of succession, known as **GAVELKIND** (*q.v.*) On the death of the occupant of land, the estate passed neither to his eldest son nor to the joint or separate occupation of his children. On the contrary the land fell back into the common property of the tribe, and the chief made a redistribution of all the lands among the members. This custom is unquestionably due to the original idea that a tribe constituted

a family, and that the whole kindred were joint-heirs of any individual member. But gavelkind did not apply to the succession to the lands of nobles, which was regulated, like the succession to the office of chief, by the custom of **TANISTRY**. By this custom a successor or *tanist* was elected by the members of the sept or tribe during the lifetime of the chief or noble. The object was to secure the succession of the fittest member of a family instead of merely the nearest blood relation.

Both gavelkind and tanistry were disliked by the English rulers, as being less definite and orderly than the rule of **PRIMOGENITURE**. Under James I. they were abolished as "lewd and damnable customs." From this time the Brehon law was jealously suppressed, and the English legal system, which had hitherto been enforced only in the counties of the **PALE** was now applied to the whole of Ireland.

R. L.

BREVI MANU TRADITIO. An expression used by mediæval writers on Roman law to express the fictitious delivery which takes place, when a person who is in physical possession of another person's property acquires the ownership of the same by purchase or otherwise.

BREWSTER, SIR FRANCIS (fl. 1674-1702), was in 1674 lord mayor of Dublin, and in 1698 appointed commissioner to inquire into the forfeited estates in Ireland. He wrote *Essays on Trade and Navigation. In Five Parts—The First Part*, London, 1695. They seem to be written with the design of supporting the Dutch against the growing commercial power of the French. He proposes a council of trades, a national bank, hospitals, working schools, and the naturalisation of foreign protestants, especially in Ireland; he makes objections to the projects of erecting free ports and recommends sumptuary laws. His statement that England upon an average of six years gained by Ireland two millions sterling per annum, and his denunciation of the oppressive treatment to which that country was subjected (p. 15 ff.) were strongly controverted by **DAVENANT** (see his Works, edited by Ch. Whitworth, vol. i. p. 377). His *New Essay-s* (sic) on Trade, 1702, make him rank among those pessimistic authors who constantly foresee the decline of trade (p. 2). Nevertheless he insists upon the necessity of allowing the exportation of wool, England being not able to work up two-thirds of its own, and forced "either to Burn or Export it" (p. 9). He recommends manufactures as a means of employing the poor (p. 124). "I think him a great Man that employs Twenty Men at his Looms, and Five Hundred Spinners, and wonder

we have no more such in Parliament" (p. 11). He recognises the dangers of the money projects (p. 20), and of the stock-jobbing mania of his age (p. 80). In all other respects his mercantilist views are the same as in his first essays (see e.g. p. 41), and only his considerations on the advantage of a union between England and Ireland (pp. 66-115), with many statistical abstracts, may be considered as valuable.

[Macleod, *Dictionary of Pol. Econ.*, p. 284.]

S. B.

BRIGANTI, FILIPPO, born at Gallipoli 1725, died 1804. In 1780 he published, in two volumes, his *Esame economico del sistema civile* viz. *Economical Analysis of Society*, which is really a refutation of the social doctrines of MABLY, ROUSSEAU, and LINGUET, particularly of their paradoxes concerning the obnoxiousness of commerce, industry, and intellectual progress. Briganti was a profound thinker, and had a vast fund of information. Discussing the advantages of exchange and commerce, he anticipates many of the views which are now advanced in this connection concerning sensations of pleasure and pain, and, in general the hedonistical calculus, as the basis of economical activity. In tracing the history of human progress and following it up in the history of agriculture, commerce, navigation, population, and intellectual and moral development, he shows himself to be possessed of a great store of information. His book, however, has lost its interest, because its principal object, viz. the refutation of Rousseau's theories, has likewise ceased to interest.

M. P.

BRIGHT, JOHN (b. 1811, d. 1889) M.P., president of the board of trade (1868-1870), eminent orator and statesman. The creation of a numerous proprietary in Ireland was eloquently advocated by Bright. The clauses in the Irish Land Bill of 1870, which facilitate the sale of land to tenants, are ascribed to his influence and associated with his name. The part which Bright played in the abolition of the corn laws is also memorable. But there are limits to the application of the idea of non-intervention which did not occur to him. He carried the principle of LAISSEZ-FAIRE so far as to oppose factory legislation; concerning which he thus defines his position—"I was opposed to all legislation restricting the work of adult men and women. I was in favour of legislation restricting the labour and guarding the health of children."

[*Speeches on Questions of Public Policy*, edited by J. E. Thorold Rogers, 1868; Hansard, lxxiii. p. 1132, lxxxix. p. 1136, xciv. p. 731, et passim; *Public Letters*, edited by J. Leech, 1885.]

F. Y. E.

BRINDLEY, JAMES (born 1716, died 1772), an eminent engineer, celebrated for the construction of canals, of which the earliest and most famous, connecting Manchester with

Worsley and Liverpool, was executed under the auspices of the Duke of Bridgewater (1759-1773), and called after his name. Almost totally uneducated, Brindley owed his success to the sheer force of genius. In thinking out his mechanical designs he sought no aid from books or models; and would even, for the purpose of greater abstraction, retire to bed for two or three days. The saying that "the natural use of rivers was to feed navigable canals," is characteristically attributed to Brindley.

[*Bibliotheca Britannica.—Lives of the Engineers*, by Smiles.]

F. Y. E.

BRISCOE, JOHN (17th century), ranks second to H. Chamberlin among the projectors of land banks who flourished in the latter part of the 17th century. Briscoe's project is set forth in his *Discourse on the Late Funds* . . . (1694, third ed. 1696). An *Abstract* of this discourse, and also a *Dialogue* (between Freeholder and Philanglus) "explanatory" thereof followed soon (1694) from Briscoe's pen. He continued in a series of broadsheets to repeat with variations his proposals for setting up a land bank. A proposal which he made for regulation of the coin (1695) is not unconnected with his darling project. He accuses J. ASGILL (q.v.) of having appropriated his ideas, see *Mr. John Asgill, his Plagiarism detected*, . . . 1696. Briscoe himself is accused of plagiarising from Chamberlin, by the author of *A Rod for the Fool's Back, or Dr. Chamberlin and his Proposals Vindicated*, 1694, attributed to Chamberlin. However, Briscoe appears as the "literary advocate of Chamberlin's land bank" (Thorold Rogers) in a letter to the doctor dated 1693, published in 1696 by Chamberlin. In some remarks prefixed to this letter Chamberlin speaks of the "great reputation Mr. Briscoe hath among some of our senators." Chamberlin adds (at the end of the letter), "As a stronger confirmation of the good opinion Mr. B. had of the doctor's 100 years proposal, he subscribed £200 per annum." Briscoe shares with Chamberlin, in proportions which it is not easy to assign, the responsibility of having originated the *land bank*, which proved such a complete failure in 1696 (see HUGH CHAMBERLIN or CHAMBERLIN).

[Macaulay, *History of England*, ch. xx. and xxii. (vol. iv. pp. 496 and 701, large 8vo ed.)—Thorold Rogers, *First Nine Years of Bank of England*, pp. 15 and 50.—*Quarterly Journal of Economics*, vol. ii. p. 490.—Macleod's *Dictionary*, sub voce "Briscoe."]

F. Y. E.

BRISSET DE WARVILLE, JEAN-PIERRE, was born 1754, at Ouarville near Chartres. He was executed in Paris in 1793. After having been imprisoned in the Bastille, he went to England and to the United States, and returned to Paris at the outbreak of the Revolution, in which he played a remarkable part, being accused of federalism by Robespierre. After the revolu-

tion of 31st May 1793, he was proscribed; he tried in vain to escape, but was arrested, and died on the scaffold, 31st October 1793. In his writings, Brissot de Warville advocated the reform of the penal laws and attacked the slaveholders in the colonies.

His works are collected under the title: *Bibliothèque philosophique du Législateur du politique et du jurisconsulte* (10 vols., Berlin, 1782-1785). One of these works is remarkable on account of its influence on later socialists: *Recherches philosophiques, sur le droit de propriété et sur le vol considérés dans la nature et dans la société*, 1780 (Bibliothèque, etc. vol. vi. p. 260 ff.). The defence of the right of property by the PHYSIOCRATS as being founded in nature, and the ridicule bestowed upon this axiom by VOLTAIRE in his *Homme à quarante écus*, induced Brissot de Warville to inquire into the justifiability of this doctrine in the natural and actual state of society. He reasons thus: the natural title of property being the human wants of self-preservation and freedom of locomotion (p. 274), there is no property beyond these limits founded in nature. But civil property reaches farther. "In the state of nature everybody has a right to all; in the social state a man who has nothing left by his parents has a right to nothing. The thief in the natural state is the rich man, who possesses superfluities; in the social state he is called a thief who steals them from the rich. What an upturn of ideas!" (p. 332). The object of this work was to mitigate the rigour of the penal laws against theft. In this direction its effect was not inconsiderable, but its influence upon the formation of the creed of Babeuf and Proudhon has incidentally been distinctly greater (see BABEUF; COMMUNISM; PROUDHON).

[Villegardelle, *Histoire des idées sociales*, etc. 1846, pp. 124-129.—J. J. Thonissen, *Le Socialisme*, 1852, vol. i. pp. 286-291.—A. Menger, *Das Recht auf den vollen Arbeitsertrag*, 1886, pp. 8, 40, 71.]

S. B.

BROGGIA, ANTONIO, a learned Neapolitan merchant, also a politician and author of two treatises, one on taxation (*Trattato dei tributi*, 1743), which was translated into German, and the other on money (*Trattato delle monete considerate nei rapporti di legittima riduzione, di circolazione e di deposito*, 1743). Both treatises are still interesting to read, as they contain a great deal of what at the present time is still taught and thought correct concerning these subjects. As is natural for a writer living when he did, Broggia is not free from physiocratic prejudices. In his treatise on taxation he says the aim of the theory is the wealth of the state; wealth reposes on the development of agriculture, industry, and commerce; industry in general ought to be left free and not hampered by vexatious taxes; the working classes, and especially peasants, ought to have their interests particularly considered, as on their welfare depends much of the prosperity of the state; tithes are the least oppressive taxes and the surest; taxes ought not to be personal;

care must be taken that taxes do not crush out trades; agricultural animals and machinery and tools ought not to be taxed. State monopolies are unadvisable. Excise and custom duties ought not to be leased out by the government. The direct land tax, if necessary, ought to be increased rather than custom duties imposed. Notwithstanding his predilection for taxes on rent, Broggia is not in favour of one single tax. He shows the advantages of indirect taxes as complementary; he only insists strongly on custom duties being moderate, so as not to molest trade. In his treatise on money, a cardinal point is that the wealth of a country does not depend upon the quantity of money existing in it or in circulation, but upon the amount of the turnover in business. In 1754 Broggia was exiled from Palermo for having written a pamphlet against the ministers. This pamphlet (a volume in 4to of 136 pages) was a criticism on their acts. He wrote also a treatise on public hygiene (*Trattato politico della sanità*). This treatise and the two other ones before mentioned constitute one single volume in the original and only edition, which was published before Custodi took up classifying, correcting, and publishing Broggia's writings. The title of the first edition is: *Trattato dei tributi, delle monete e del governo politico della Sanità*. In Napoli, presso Pietro Palombo, 1743. As a complement of his monetary doctrines must be considered a pamphlet he wrote in defence of them under the extraordinary title which follows: *Risposte alle obiezioni state fatte da varj Soggetti, intorno al sistema del prezzo corrente, che assolutamente dee tenersi per la ricompensa degli arrendamenti, e similmente a quelle state anche fatte intorno alla rinnovazione delle moneta di rame, che dee anch' essa avere tutto quel valore intrinseco che di giustizia gli spetta, e tanta farsene che non ecceda il puro bisogno degli scambj minuti*, Napoli, a di 14 Novembre 1755. Of his life no particulars are known not even when he was born and when he died. It is commonly maintained that he was born in 1683, and that he died in 1767, but the dates are contested. His works are included in the Collezione CUSTODI.

M. P.

BROKER, GENERAL. A broker may be generally described as a go-between, who brings buyers and sellers together; not exactly face to face, but acting as an intermediary who introduces their bargains rather than their persons. The position is a responsible one, inasmuch as the principals who employ a broker very often keep a running account and trust him, in goods or money, to large amounts. As a rule, brokers are under the rules of a syndicate or corporate body of which they become members, and to whose rules they are usually amenable on pain of expulsion. There are tea brokers, coffee brokers, sugar brokers, and so on without end in almost every wholesale trade, and their practice

varies with their standing, some brokers being virtually factors or warehousemen, others being simply agents, paid by fee, instead of by a varying salary. A. E.

BROKER, STOCK. A stock-broker may be either a member of the stock exchange of London, Dublin, Manchester, Liverpool, Glasgow, or elsewhere; or only what is known as an outside broker. His duty is to buy or sell for a "principal." On the London stock exchange, nobody who is not a recognised member is permitted to deal. A broker, having received an order to buy say £500 stock, goes to any member of the stock exchange, known indifferently as a jobber or dealer, and asks for a quotation. The dealer quotes two prices, say 80½ to 80¾, meaning that he will sell to the broker at the higher price and buy at the lower quotation. If the broker consider this fair he will say, "I buy £500 at 80½," and the contract is binding between these two members of the stock exchange. Members, their admitted clerks, or officials only are permitted to enter the London stock exchange, therefore brokers must be employed by all outsiders desirous to do business there. A. E.

BROKERAGE. A charge made by a broker on the purchase or sale of securities or other property.

BROUGHAM, HENRY (born 1778, died 1868), Baron Brougham and Vaux, lord chancellor, touched nearly all subjects and adorned some by his eloquence and dialectical skill. The contact seems least superficial, the ornament particularly solid, in the case of political economy. Brougham's first considerable work was *An Inquiry into the Colonial Policy of European Powers*, 1803. Criticising Adam SMITH, he maintains that the monopoly of the colonial trade did not produce all the detrimental effects ascribed to it (bk. i. § 2, part ii.) Referring to the slave colonies, Brougham not only denounces the slave trade as iniquitous—"not a trade, but a crime"—but also argues that it is unprofitable. The argument is renewed in *A Concise Statement of the Question regarding the Abolition of Slave Trade* (1804). Slavery, as well as slave trade, was assailed by Brougham's oratory (*Speeches*, published in 1838, vol. ii.)

Free trade owes something to Brougham's advocacy. He exposed the folly of retaliation, as counsel (1808) for the merchants who petitioned parliament against the orders in council directed against Napoleon's continental system. After Brougham's masterly speech in 1812, the obnoxious orders were withdrawn (*Speeches*, vol. i.) In the speech on manufacturing distress (1817) Brougham strikes at the complicated taxes which fettered trade (*ibid.*) But in the equally able speech on agricultural distress (1816) there is a good word for the corn law (*ibid.* p. 533).

Other economic topics handled by Brougham are: (1) depreciation of money, with reference to Sir E. Shuckburgh's standard (article on "Currency and Commerce," *Contributions to Edinburgh Review*, published 1856, vol. iii. p. 22; *E. R.*, Oct. 1803); (2) usury (*Contributions*, vol. iii. p. 52; *E. R.*, Dec. 1816); (3) overpopulation (speech on the poor laws, 1834, *Speeches*, vol. iii.); (4) combinations (*Transactions of the Society for promoting Social Science* for 1860, p. 51). Brougham is also to be mentioned as a promoter of education and educational institutions—the London University, the Society for the Diffusion of Useful Knowledge, Mechanics' Institutes, and the Society for promoting Social Science.

In addition to the works which have been cited may be noticed: (1) *A Manual for Mechanics' Institutions*, 1839 (by B. F. Duppa, with outlines of lectures on political economy by Brougham); (2) *Political Philosophy*, 1842; (3) *Works*, 1st ed. 1855-61, 2d ed. 1873. In the 11th vol. of the 2d ed. there is a list of Brougham's publications, numbering 133. F. Y. E.

BROWN, JOHN (1715-1766), was vicar of St. Nicholas, Newcastle. He maintained that "commerce in its first and middle stages is beneficent, in its last dangerous and fatal"; that it is answerable for selfishness, luxury, and want of religion; and that by causing a drain of money and by the invention of machines it diminishes the population. He asserts that the country parish registers prove that from 1710 to his time the population was at least stationary. See his book *An Estimate of the Manners and Principles of the Times*. By the author of *Essays on the Characteristics*, etc., London, 1757, pp. 151, 185, 188.

[For a contemporary reference see: *A Vindication of Commerce and the Arts*. By J.-B., M.D., 1758, p. xvi., and Wallace, *Characteristics of the Present State*, 1758, p. 193.—Brown's own book *Essays on the Characteristics*, etc. is of no economic value.] S. B.

BRYDGES, SIR EGERTON, Bart. (b. 1762, d. 1837). To any one disposed to make a psychological study of a defunct antiquary, topographer, essayist, bibliographer, poet, novelist, and critic, and who added to these occupations the study of political economy and occasional authorship in that science, Sir E. Brydges would afford an excellent subject. On the good side may be placed his industry and power of research, considerable originality, and a deep acquaintance with the ancient literature of England and of foreign countries. On the bad side should be ranged his excessively morbid temperament, a craze about an assumed right to an ancient barony, an intense suspicion of the motives of those who differed from him, and an unfounded notion that he was not sufficiently rewarded for his services in the cause of learning. Much

material bearing on all this exists in his *Autobiography and Letters from the Continent*, as well as in his voluminous published and privately printed works, which in the course of his long life extended to no less than one hundred and forty volumes. We find in a quantity of his letters, which have never been printed, addressed, from 1818 to 1832, to Mr. James S. Brooks, member of a firm of solicitors who acted for him, and with whom, in a characteristic manner, he often fell out, many striking examples of Sir Egerton Brydges' talent as a political economist. It is a curious fact that in his most desponding and brooding moments he would fly to political economy as a relaxation of thought and as a favourite study, just as many of our first-class English statesmen have relieved tension of mind and the excitement of political conflict by Homeric studies or the composition of Greek and Latin verses.

His published works touching on economics are: (1) *Tests of the National Wealth*, 1799, 8vo.—(2) *Letters on the Poor Laws*, 1814, 8vo.—(3) *Arguments for the Employment of the Poor*, 1817, 8vo.—(4) *Three Tracts on "Copyright,"* 1817-18, 8vo.—(5) *The Population and Riches of Nations considered*, Geneva, 1819, 8vo. A second edition of this was afterwards printed at the author's private Lee Press.—(6) *What are Riches?* Geneva, 1821, 8vo.—(7) *Letter on the Corn Question*, 1822, folio.—(8) *Letter on the Proposed Plan for reducing the National Debt*, Florence, 1820, 4to. Although Sir Egerton Brydges' works, above cited, contain flashes of insight into correct deductions, practical as well as theoretical, they are a good deal disfigured by his want of study of the statistics and practice of commerce, and his ignorance of business generally.

F. H.

BUBBLE ACT. Popular name for an act passed in the reign of George I. with the intention of preventing the creation of joint stock companies. The name is derived from the fact that one of its objects was to protect the privileges of the SOUTH SEA COMPANY. It had no practical effect, and was repealed in 1825.

E. S.

The phenomenon of bubbles (or joint-stock undertakings the shares of which were "blown up by the air of great words") first showed itself prominently in England at the end of the 17th century (see Anderson, *Hist. of Commerce*, esp. under dates 1695, 1697), when the Royal Exchange became so crowded with projectors and stock-jobbers that they were provided with an exchange of their own, first in Exchange Alley and later in Capel Court. An act was passed in 1696 "for restraining the practices of brokers and stockjobbers." It limited the number of licensed brokers to one hundred, and put difficulties in the way of their dealing with government stock and TALLIES (*q.v.*) The outburst of speculation a quarter of a century later was associated with the South Sea Company. It led to more ambitious legislation.

The act specially known as the Bubble Act was passed in 1720, principally to define the privileges of the companies that were afterwards known as the London Assurance and the Royal Exchange Assurance Companies, but also to punish bubble companies for trading (*a*) under obsolete or forfeited charters, or (*b*) for purposes not allowed in their charters, or (*c*) with no charters at all. This act was not to apply to undertakings established before 1718. The South Sea Company had promoted it in the belief that the bubble companies were rivals, whereas they were really allies; money was gained in them to be invested in the greater company. As the act and subsequent royal proclamation proved ineffectual, the South Sea Company procured a writ of *scire facias* against "those airy projects called bubbles;" but the effect was to bring down the credit of small and great together (Anderson, *ib.* under date 1720, esp. p. 101 *seq.*), and to cause the ruin of multitudes of rich and poor subscribers. To relieve the sufferers acts were passed (1721) to attach the estates of the South Sea Company's directors, to relieve subscribers from part of their obligations, and (1722) to enable the company to improve its position by an arrangement with the Bank of England. The act (1722) to punish fraudulent transfers of stock may perhaps be counted the last of the series, though the affairs of the South Sea Company were a frequent subject of legislation for some years afterwards.

J. B.

BUBBLES (HISTORY OF). The term bubble has been commonly applied since the 17th century to any unsound commercial undertaking accompanied by a high degree of speculation. The first bubble of historical importance was connected with the growth of varieties of tulips in Holland. It reached its height in 1636 in Amsterdam, and in the most of the Dutch cities regular markets were established for speculation in the roots. In the end tulips were bought and sold like shares in a gold mine, for purely speculative purposes, without any idea of actually growing the flowers. Fabulous prices were paid for single bulbs, *e.g.* 2500 florins for a "viceroy," a "semper augustus" 5500 florins, etc. The mania spread to some extent to London and Paris, and tulips were dealt in by the stock-jobbers of both cities.

In 1719 and 1720 occurred the greatest speculative mania on record, arising from the Mississippi scheme of JOHN LAW (*q.v.*) The rage for speculation in Paris was incredible, and affected all classes of society. John Law's schemes were not in themselves, according to most modern writers, unreasonable, and in many respects he only anticipated the natural development of banking and credit, but his whole system was ruined by the extravagant speculation with which it at once became associated. The extent of the mania may be

indicated by the fact that for a time John Law became the most powerful man in France.

In England, however, the word bubble is generally associated with the South Sea Bubble which burst in 1720, and was the English counterpart of the Mississippi scheme. The South Sea Company was originated by Harley, Earl of Oxford, in the year 1711. The original idea was to found a company which should take over the floating debt of nearly ten millions, arising from the expenses of the army and navy. The company was to receive interest from the government at the rate of six per cent, and for this purpose certain duties were allocated. In addition the monopoly of trade to the South Seas was granted, and the company became known by that name; as a matter of fact, owing partly to the opposition of Spain, the trade with the South Seas, or rather South America, produced very little revenue at any time. But the directors of the company thought that they might imitate the success of John Law by other operations in finance, and they competed with the Bank of England in offers to undertake the reduction of the national debt, which amounted to about £30,000,000. After a debate in the House of Commons the proposals of the South Sea Company were accepted in preference to those of the Bank of England! Sir Robert WALPOLE was almost the only prominent statesman who spoke against it, and warned the House of the dangers of stock-jobbing as carried on in France. During the time the bill was being passed through the House of Commons the most extravagant rumours were set afloat, especially by the chairman, Sir John Blunt, as to the trading possibilities of the company, with the view of forcing up the price of the shares. Before the bill reached the Lords the price of the stock had reached 400. It was opposed by several peers of good standing, but was hurried through with unexampled rapidity. By this time, 7th April 1720, the whole nation had begun to be infected with the stock-jobbing mania. Exchange Alley and Cornhill were almost impassable with the crowds. The South Sea stock, which curiously enough suffered a momentary fall on the passing of the bill in favour of the company, was soon subjected to all kinds of adroit manipulation. In consequence the directors were enabled in a few days to issue a million of stock at £300 for the nominal £100, and a little later another million was issued at £400, for which "in a few hours, a million and a half was subscribed."

In the meantime, numberless other joint-stock companies were started, which soon began to be called bubbles. The highest persons in the state, including the Prince of Wales, were interested in one or more of those companies. Some of them only lasted a few days, and the infatuation was at length carried to such a

pitch that one project was advertised in the newspapers as follows: "For subscribing two millions to a certain promising or profitable design, which will hereafter be promulgated." It is hardly credible that the bold projector of this scheme, in a few hours, sold 1000 shares on which he received, by way of deposit, £2 per share, and was able to decamp with £2000.

The South Sea stock continued to rise for nearly two months, and at the end of May reached about 550. At this time it took a tremendous leap of 340 per cent, and was quoted on the 3d of June at 890. On this day, however, it fell as rapidly, but was again bolstered up by the directors getting their agents to buy. The speculation continued during the summer, the stock at one time reaching 1000; but by the beginning of September a serious fall had commenced, and the directors became alarmed. Negotiations were attempted with the Bank of England, but a panic had set in which nothing could check. Thus the bubble burst after a run of eight months. The greatest popular indignation was aroused against the directors, and found expression in parliament. An inquiry was instituted and pushed on rapidly. In the sequel upwards of two millions was taken, in the shape of fines, from the estates of the directors, and they were allowed to retain only a small residue.

[Full details of these bubbles are given in Macpherson's *Annals of Commerce*, under the years named. Popular accounts are given in Mackay's *Memoirs of Extraordinary Popular Delusions*, London, 1852, and Francis's *Chronicles and Characters of the Stock Exchange*, London, 1849. See also TAVEREEL.] J. S. N.

BUCHANAN, DAVID (1779-1848). A journalist and economist, was a son of David Buchanan, a printer, and was born at Montrose in 1779. At an early period of his life he commenced his career as an economist by a contribution to COBBETT's *Political Register*. He contributed articles to the *Edinburgh Review*, published a pamphlet on PITT's volunteer system (1807), contributed to the seventh edition of the *Encyclopædia Britannica*, and edited the *Edinburgh Gazetteer*. As a journalist, his experience was varied, since he was editor successively of the *Weekly Register* (1808-1809), the *Caledonian Mercury* (1810-1827), the *Edinburgh Courier* (1827-1848). As an economist, in 1814 he edited an edition of Adam Smith's *Inquiry into the Causes of the Wealth of Nations* in four volumes, the last volume consisting of additional matter supplied by himself by way of illustration and correction (this edition of Adam SMITH was translated into French in 1843). In 1844 he published a work entitled *Inquiry into the Taxation and Commercial Policy of Great Britain, with Observations on the Principles of Currency and Exchangeable Value*. To a large extent this latter work is a mature reproduc-

tion of the matter contained in his additional volume of comments of 1814. While he goes beyond the theories laid down by Adam Smith, his final treatise does not indicate any development due to the study of those economic works which had been published since he began to write in 1814. He displays a considerable understanding of the causes which determine prices, and brings out with great lucidity the effect of the interaction of supply and demand. Thus he performed no little service to economic theory by disentangling the many important elements underlying the work of Adam Smith. On the other hand he failed altogether to understand the main basis of the Ricardian theory, recognising no distinction between an "increase in *wealth*" and an "increase in *value*." In consequence he is unable to comprehend the technical use by RICARDO of the term "profits," and will not allow that that author was right in asserting that a fall or rise in *profits* depended on a rise or fall in *wages*. This was owing to his misunderstanding the interpretation applied to these terms by Ricardo. Of a somewhat similar nature is his attack on the theory of rent. He confuses the theory with its practical application; while he further failed to understand the treatment by Ricardo of the case of a country where all the soil is under cultivation, but where the difference of quality as to return to respective "doses" renders the law of rent like to that obtaining where cultivation has not yet covered the whole surface. He does not give Ricardo sufficient attention in this instance, while in another he accuses him—again no doubt through misconception—of having thought and said that the high price of corn was the effect of the higher expense of cultivation, urging on his part that this high price it was which caused people to be willing to encounter the high expense. Again he asserts that *in theory* the tithes are paid out of the rent.

For these and other reasons it is impossible to attribute to his treatises any great value on the side of theory. On the other hand his treatment of taxation is sensible and very practical.

[*Dictionary of National Biography*.—Montrose Standard, 18th August 1848; works as cited in text.] E. C. K. G.

BUCHEZ, PHILIPPE JOSEPH BENJAMIN, born 1796 at Mattaigne (Belgium, at that time a department of the Ardennes), died 1865 at Rodez. Left dependent on his own resources at twenty, he commenced life with the study of natural science. In 1821 he established, in conjunction with BAZARD and Flottard, the society of the CARBONARI (*q.v.*) in France. Devoting himself to the service of this secret society with the fury of youth, he barely escaped, 1822, being sentenced to death. Altering then the scope of his operations, he worked after the

death of St. SIMON, whom he never had known, on the *Producteur* (1825-26). About this date he began to be detached from the followers of St. Simon, with whom, however, he did not definitely part company till 1829. He then published several works on medical science, and, during the revolution of 1830 attended, with great courage, the wounded under fire. Taking his pen up again, he published his *Introduction à la Science de l'Histoire* (1833, reprinted 1842), and afterwards, in conjunction with Roux Lavergne, the work by which he is best known (*Histoire parlementaire de la Révolution Française*, 1833-38, 40 vols., reprinted—the first seven alone 1846). In this work, without approving the violence and bloodshed, he rehabilitated the principal personages of the first revolution. This was followed by his *Essai d'un traité complet de Philosophie au point de vue du Catholicisme et du Progrès* (1838-40, 3 vols.), in which he sought, in harmony with his St. Simonian views, to reconcile philosophy with Catholicism. He had founded (May 1847 to July 1848) the *Revue Nationale* when the Revolution of 1848 broke out. Appointed *Maire-adjoint* of Paris, he took great part in the suppression of the disturbances in the streets, particularly of the socialist manifestation of 16th April. Elected by 135,000 votes a representative of the people, he was chosen, 4th May, president, on the opening of the *Assemblée Constituante*, and was in the chair, 15th May, when the chamber was invaded by the revolutionary socialists. The firmness and dignity of his conduct brought him respect from all. He continued actively to fulfil the duties of his post, but was not elected a member of the *Assemblée Législative*. He was arrested at the *Coup d'état*, December 1851, but was soon set at liberty, and occupied himself in writing, 1856, the *Histoire de la formation de la Nationalité Française*, 2 vols. in 32mo, reprinted 1859 under the title of *Les Mérovingiens et les Carolingiens*. He was the first to speak in France in favour of *Associations Ouvrières*, which he desired to establish under a form approaching that of a religious order, not only to secure propriety of conduct, but perpetuity and increase of capital. His disciples and friends MM. L. Cerise and A. Ott published, in 1866, after his death, a posthumous work, *Traité de Politique et de Science Sociale*, preceded by a notice of his life and works by M. A. Ott. A. C. F.

BUCKLE, THOMAS HENRY, born 1821, led a student's reclusive life, devoted to the great historic work which he left unfinished on his death in his forty-first year (1862). In the introduction to this work, the principle that human actions obey laws verifiable by statistics, was, as Mill says (*Logic*, bk. v. ch. ii. § 1), "most clearly and triumphantly brought out" by Buckle. MILL does not however agree

in the opinion that the moral qualities of mankind are little capable of being improved, and conduce little to the progress of society (*Ib.* § 2). Dr. Venn has protested more strongly against Buckle's fatalistic interpretation of statistics (*Logic of Chance*, 2d ed. pp. 235-241). An erroneous impression of the futility of human effort is conveyed by such statements as "suicide is merely a product of the general condition of society, and the individual felon only carries into effect what is a necessary consequence of preceding circumstances" (Venn, *Logic of Chance*, 2d ed. ch. xviii. § 14; Buckle, *History of Civilisation*, vol. i. ch. i.) The same disposition to underrate the force of human will appears in Buckle's theories as to the influence of physical conditions on wages and population: "There is a strong and constant tendency in hot countries for wages to be low, in cold countries for them to be high. The evil condition of Ireland was the natural result of cheap and abundant food" (*History of Civilisation*, ch. ii.) He here maintains that "potato philosophy of wages," which Prof. WALKER stigmatised (*Pol. Econ.*, bk. v. ch. iii.) Buckle's economical reflections are indeed not always sound, but they bear the impress of originality, enhanced by copious learning and recondite references. His account of the discoveries made by political economists is masterly (ch. iv.) The remarks on the leading economists, in particular ADAM SMITH and HUME, are instructive, even when disputable. The description of Adam Smith's method as *deductive*, is a half-truth characteristic of Buckle.

History of Civilisation in England, vol. i. 1857, vol. ii. 1861.—New Edition (with index) 1869.—*Miscellaneous and Posthumous Works*, edited by Helen Taylor, 1872; with a biographical notice by the editor. (Among the posthumous works are fragments, some of which relate to economical topics: e.g. *History of Money*, p. 438; *Wages*, p. 459; *Statistics, and Political Economy*, pp. 526, 528). BUDGET, THE,¹ is the statement of the nation's accounts, drawn up and presented once a year to parliament by the chancellor of the exchequer. In opening his budget, the finance minister first lays before the House the complete accounts of the past financial year, with its actual revenue and expenditure, and the realised surplus or deficiency. For this purpose, and to enable an accurate estimate of the revenue of the coming year to be made, the budget is never, except under peculiar circumstances, taken until a week or two after the close of the financial year, which now runs from 1st April

to 31st March.² On the other hand, the budget is seldom postponed for more than a short time after that date, so that the period of disturbance to trade, due to the uncertainty of the financial proposals of the year, may be as far as possible curtailed.

The result of the finance of the past year having been stated, the chancellor of the exchequer proceeds to detail the expenditure of the coming year, as estimated by the different departments after review and criticism by cabinet and treasury. These estimates are divided into two parts—the CONSOLIDATED FUND (*g.v.*) and the SUPPLY services.³

The amount of the expenditure for the coming year is generally known before the budget is introduced, for the estimates of the supply services have as a rule already been presented to the House; and portions of them, or "votes on account," have probably already been taken.

Against the total of the estimated expenditure ("ordinary" or "extraordinary," the latter term being now usually applied to war expenditure of any kind) it becomes necessary to provide the "ways and means"; and this is the budget proper. The taxation in force during the year just come to a close is almost invariably assumed as the basis of the estimate of the revenue for the coming year, any variations which are likely to ensue being, especially since 1874, taken into account.⁴

On a comparison of the estimated revenue with the estimated expenditure, a surplus or a deficit, as the case may be, appears. Since Peel's time it has been the almost invariable custom, except under great stress of war charge, for the chancellor of the exchequer to take care that, in his final budget estimates of revenue and expenditure, an estimated surplus of three

² The financial year used, till 1832, to run from 1st January to 31st December. The budget is usually taken about the middle of April. In 1860, in consequence of the necessity of an early ratification of the French commercial treaty, the budget was introduced on 10th February. In 1859, in consequence of the change of government, it was not introduced until 18th July. In 1880 there were two budgets, one on 11th March (Northcote's) before the dissolution, the other on 10th June (Gladstone's) after the assembling of the new House.

³ The CONSOLIDATED FUND—created by Pitt in 1787, for the greater security of the DEBT and other fixed charges, and the more certain maintenance of his SINKING FUND—includes the CIVIL LIST, debt charge, certain pensions, judicial and other salaries, constituting an annual charge fixed by statute, and only to be altered by statute.

The SUPPLY services include the rest of the ordinary expenditure of the country,—the army, the navy, the civil service and the revenue departments, which last include the post office and the cost of the collection of the revenue. These supply services are annually voted item by item in committee (the money being nowadays very strictly "appropriated"), and the amounts can be criticised and reduced, but not increased, by the House. The accounts are subsequently audited, and go before the Public Accounts Committee.

⁴ This is almost invariably the case. In 1868 and in 1885, however, the special taxation imposed in the previous year was eliminated from the estimate, and in 1858 Mr. Disraeli took the income tax at 5d. in accordance with the arrangement of 1853, instead of at the 7d. of the previous year.

¹ From the Old French "bougette," diminutive of "bourse," a purse. The term and method of a Budget are used in other countries, see R. Stourm, *Cours de Finances: le Budget*, 2d ed., Paris, 1891, 8vo.

or four hundred thousand pounds shall be shown. This he does for the twofold object of providing for unforeseen contingencies to expenditure or diminution of revenue; so that, if possible, the year shall not end with an addition to the national debt, in other words a deficit, but rather that something shall remain in hand to go towards its further redemption. This policy has become especially essential since 1874, in which year the system of close estimates was finally adopted; for under the old system, in which practically no account was taken of the normal annual increase of revenue, a surplus was ready to hand if the revenue of the year exceeded that of its predecessor. Unforeseen circumstances may indeed, affect the surplus, but a surplus ought distinctly to be allowed for in the budget—a chancellor of the exchequer, according to Mr. Lowe's definition, being "an animal who ought to have a surplus."

The "ways and means" of the year include the whole of the sources of national revenue, and not only those derived from actual taxation—not only the so-called "tax revenue," but the gross receipts from the business departments (post office, etc.), the net revenue derived from the crown lands, and miscellaneous receipts of different sorts. The continuation of the annual taxes, together with any alteration that may be proposed in them or in the permanent taxes with the view of either distributing the surplus or filling up the deficit, are embodied in resolutions which, in order to obviate possible evasion, are almost always provisionally confirmed on the night of the introduction of the budget.

The resolutions agreed to, they are annually embodied in one bill—the customs and inland revenue bill—which goes through the House of Commons in the ordinary course, and is liable to amendment like any other bill. After passing the Lower House, the bill goes up to the Lords, who can, if they choose, reject, but are precluded from amending it.

The system of including all the *WAYS* and *MEANS* proposals of the year in one bill dates from 1861. In the previous year the government had proposed to repeal the paper duty, and this proposal had been embodied in a bill separate from the other budget proposals; and this bill the House of Lords rejected. To prevent the House of Lords from in future discriminating between the different budget proposals, it was decided that in future they should be all included in one bill.

Occasionally—especially under stress of war expenditure—it becomes necessary for the chancellor of the exchequer later in the year to introduce a supplementary budget, and to provide further ways and means to meet additional expenditure. This additional taxation is voted in the same way as the ordinary taxation of the year, though sometimes it is made retrospective,

or a double amount is placed on the last half of the year.

During the last twenty years—since the system of more strict appropriation has come into force—supplementary civil service estimates have become a permanent institution, though additional money is seldom or never voted for them, and on balance they are (or ought to be) met by savings on other items of expenditure.

The nature of the sources of "supply" is detailed elsewhere (see *TAXATION*; *CUSTOMS*), but the policy that has more or less actuated successive chancellors of exchequer since the first quarter of the century, and its effect on the financial resources of the nation, may be briefly summarised. The modern era of fiscal and financial reform dates from the time of *HUSKISSON*, mainly between 1824-1828; intermittently followed by his immediate successors, his policy was zealously adopted and carried distinctly further by *PEEL* between 1842 and 1846. Taken up with vigour by *GLADSTONE* in 1853, and, as far as the principle was concerned, finally adopted in 1860, it has since in detail been carried ever farther and farther.

This policy, thus gradually and slowly brought to completion, has been as follows: first, the abolition of all petty, vexatious, and unremunerative duties; secondly, the repeal of all prohibitive, protective, differential, and discriminating duties, and the introduction of perfect equality and unrestricted competition between home, colonial, and foreign goods in regard to the rate of taxation; thirdly, the general reduction of the duties to a minimum, and the choice for taxation of those articles from which the necessary revenue can be raised most evenly, most easily, with the smallest cost and discomfort to the consumer and taxpayer, and in the manner least burdensome to trade. And, in the case of the duties still retained, for the most part to carry out the seeming paradox, as Pitt once called it, "increase by reduction"—to increase the yield of the tax by decreasing the duty, and thus at the same time encouraging consumption and minimising fraud and evasion. In the case, however, of one branch of revenue, that namely derived from intoxicants, these principles only partially prevail; such taxation being governed by politico-moral even more than by fiscal considerations. The practical result of this policy has been to reduce the articles or subdivisions of articles on which import or export duties were charged, from 1046 in 1841 to less than half that number in 1846, to 400 in 1859, and to 143 in 1860. They now number but 47, and even of these only 12 yield an appreciable revenue, the rest being duties retained either in order to counter-vail excise duties, or levied on articles which bear such a resemblance to those charged with duty that evasion and fraud would take place

if they were not also taxed. Staple articles of commerce such as timber, sugar, cotton-wool, silk, woollen goods, "fancy" goods, corn, and other articles of food, which in early days were either prohibited or heavily charged with duty, now go free. Similarly, a great deliverance has come to many important articles of home production formerly hampered and injured by heavy and vexatious excise duties, such as those on glass, paper, soap, candles, printed calicoes, and cottons. Indeed practically every article of home production is now free except those connected with the manufacture of intoxicants.¹

No one nowadays would probably venture to assert that the general adoption of free trade in fiscal matters, and the abolition of all small, vexatious, or unremunerative duties has not been of infinite advantage to the country; but it may well be argued that the policy of concentration has been carried somewhat too far in the relinquishment of considerable taxation on articles of general consumption, raised with ease and producing considerable revenue,—such taxes, for instance, as the "nominal" duty on corn abolished in 1869; the duty on sugar abolished in 1874, though the uneconomical reduction of 1873 made final abolition inevitable²; and the horse duty abolished in the same year.

But the fact was that these three duties, probably the only duties about which any question of expediency can arise, were relinquished at a time when the expenditure was almost stationary, while the revenue was so buoyant that the difficulty of the chancellor of the exchequer was not, as now, to make both ends meet, but to know what to do "with all the money that persisted in pouring in upon him." Perhaps our chancellors of the exchequer, in the heyday of their financial prosperity between fifteen to twenty years ago, ought to have realised, on the one hand, that the national expenditure would increase and could not be diminished; and, on the other, that the

"ravages of temperance" would play havoc with one of the principal branches of the revenue. But this they did not foresee, and hence they lightly relinquished the many millions of revenue that the aforementioned three taxes would probably now be producing—taxes, two of which at least could never be with advantage re-imposed.

One chief result of this policy of abolition has been, no doubt, that the income tax, introduced forty-six years ago for a temporary purpose, and now finally a permanent tax, is ever more and more looked to as a source of revenue to make up a deficiency. But, after all, the INCOME TAX has the advantage of being a direct tax, and the additional advantage of being more or less a tax on wealth. Moreover, in consequence of the relinquishment of so many indirect taxes (to the advantage of trade and the taxpayer), though the total gross receipt from the income tax stands at a figure which would have astounded our fathers, the pressure on each individual taxpayer is less than in the old days.

A word or two may be said in reference to the most famous of English budgets of the last hundred years. Pitt's great budget of 1798, wherein he unfolded his scheme for financing the life and death struggle with France, is memorable for the first imposition of the income tax, and the Huskisson-Robinson budgets of 1823-26, for the first beginning of fiscal reform. Althorp's first budget, that of 1831, was remarkable in that it attempted so much and accomplished so little. The Whigs in their abortive budget of 1841—the first budget professedly based on free-trade principles—proposed, in addition to dealing with the corn laws, greatly to reduce the protective and differential duties on the two most important articles of general consumption—sugar and timber. Then followed Peel's budgets,³ each more progressive than its predecessor. Beginning with that of 1842, which involved the re-imposition of the income tax (swept away in 1816), and ending with that of 1846, the proposals they contained, together with the repeal of the corn laws, made the practical adoption of free trade only a question of years.

The Whig budget of 1851, like Althorp's of twenty years before, and that of Lowe twenty years later, is chiefly remembered for its failures. In that year the House, for the first time since the re-imposition of the income tax, refused to renew it for a term of years, and voted it for a single year only; a precedent which (except during the Crimean War) has ever since been followed.

The free-trade budget of December 1852—

¹ In 1840, according to the Report of the celebrated Import Duties Committee, import customs duties were, in 1838, charged on 868 articles (exclusive of subheads), the yield from which could be divided as follows:—

17 articles produced 95 per cent	£21,700,000
20 " " 4 " "	899,000
144 " " 1 " "	363,000
531 " " " "	80,000

147 " loss, deduct	5,000
808	£23,037,000

In 1888.	
3 articles produced 90 per cent	£18,100,000
8 " " 9 " "	1,800,000
47 " " 1 " "	200,000
53	£20,100,000

The 47 are principally nominal.

² The duties on sugar were reduced in 1873 to the moiety of what they had been in 1870. In that year also there had been a reduction, so that they were in 1870 but the quarter, speaking generally, of what they stood at in 1867.

³ As a matter of fact, Goulburn was chancellor of the exchequer, but the budgets were those of Peel; and he himself (as prime minister) introduced those of 1842 and 1845, as well as the bill for the repeal of the corn laws in 1846.

brought forward by Mr. Disraeli as chancellor of the exchequer in Lord Derby's protectionist ministry—marked the total collapse of the protectionist party, while it brought about the defeat and resignation of the Government. The following year saw Mr. Gladstone's famous budget of 1853 which, together with those of 1842-46, and that of 1860, formed a series of fiscal measures which resulted in the complete emancipation of trade from prohibitive, protective, and differential duties. The budget of 1853 dealt also with the income tax, the chancellor of the exchequer proposing gradually to extinguish it in seven years. The Crimean War frustrated the plan; and the income tax also surviving the subsequent attempts to extinguish it, made by the same hand, under the scheme of 1864 and again in 1874, is now unquestionably a permanent institution. The budget of 1860—also Mr. Gladstone's—was additionally marked by the fact that it was contingent on the negotiation of the French commercial treaty, a treaty which was adopted, and, to the great benefit of England and France, remained in force for twenty years. The budget of 1860 was followed by a succession of Gladstonian budgets, marked by much financial ability. Mr. Lowe's budgets of 1869-73 were chiefly remarkable for the extraordinary leaps and bounds of the revenue, which enabled him greatly to reduce taxation, as well as considerably to reduce the national debt. The budget of 1874—the “six millions surplus” budget—was not so far-reaching or satisfactory as it probably would have been if the chancellor of the exchequer, Sir Stafford NORTHCOTE, could have had a longer time in which to consider and develop his financial schemes. Sir Stafford Northcote's three last budgets, 1878-80, were chiefly memorable from the fact that no real effort was made to provide a surplus of revenue over expenditure.

The budget of 1880 (Mr. Gladstone again) was marked by the commutation of the malt tax into a beer duty. Under that of 1883 (Mr. Childers) an arrangement was made for preventing any break or diminution in the annual sum applied to the redemption of the debt, by replacing on a sound and satisfactory basis the large amount of TERMINABLE ANNUITIES that otherwise would have lapsed in 1885. Under this scheme, without any addition to the debt charge, some 123 millions of debt were to be redeemed in twenty years. The Liberal budget of 1885, under which it was proposed to meet a deficit of 14 millions by the imposition of 7 millions of additional taxation and the temporary suspension of the sinking fund, was rejected; and, for the second time in the century, a defeat on a budget was followed by the resignation of the Government. By Mr. Goschen's budget of 1888 the sinking fund was invaded, and the annual amount applied to the redemption of the debt

was permanently reduced by 2 millions; and this, under no stress of special expenditure, with a surplus in hand, in order that the income tax might be reduced by a penny.

The year 1888 was also noticeable for the reduction of all the 3 per cent stocks to $2\frac{3}{4}$ per cent, a rate which was to fall to $2\frac{1}{2}$ per cent in fourteen years (see CONVERSION OF NATIONAL DEBT).

These are the most famous budgets of the century; the most important of all being those of the years 1798, 1842, 1846, 1853, and 1860.

[The authorities that could be quoted for this article are innumerable, for the study of finance involves historical as well as fiscal and financial works. Of financial works may be named Dowell's *History of Taxes and Taxation*.—M'Culloch's writings.—Porter's *Progress of the Nation*.—Levi, *History of Commerce*.—Tayler's *History of Taxation*.—Northcote's *Twenty Years' Financial Policy*.—and Buxton's *Finance and Politics, an Historical Study, 1786-1885*.

In addition, there are the speeches of the chancellors of the exchequer as reported by Hansard; parliamentary blue-books, innumerable reports of committees and commissions, the annual “finance accounts” and “statistical abstracts,” and last, but by no means least, the large blue-book published in 1868, entitled the *Public Income and Expenditure Return*.—and the *Report of the Import Duties Committee of 1840*.] s. c. b.

BUILDING SOCIETIES. Building societies are societies formed “for the purpose of raising by the subscription of the members a stock or fund for making advances to members out of the funds of the society, upon security of freehold, copyhold, or leasehold estate by way of mortgage” (37 & 38 Vict. c. 42, § 13). Societies of this nature existed for some time before they became the subject of legislation. “There were certain persons who had saved or were saving money and were desirous of investing it at a higher rate of interest than the usury laws enabled them to obtain at the time, and other persons who were desirous of either building or buying houses for their own habitation. These two classes came together: the persons who had saved money or were saving money paid it into the society, and it was lent to persons who were desirous of building or buying houses on the security of the houses, and on terms which compelled the borrowers to pay a larger sum by way of interest than 5 per cent per annum . . . Under these circumstances the act 6 & 7 William IV. c. 32, for the regulation of building societies, was passed” (Sir George Jessel, *in re Guardian Benefit Building Society, Law Reports*, 23 Ch. Div. p. 457). The Act of William IV. provided for the registration of building societies and gave them certain privileges, but the liability of the members remained unlimited, and no corporate rights were given to such societies (whose

property was therefore required to be vested in trustees, a circumstance causing much practical inconvenience). The act of William IV. was repealed by the Building Societies Act, 1874 (37 & 38 Vict. c. 42), which, together with several amending acts, now regulates the law on the subject. There are *terminating* and *permanent* building societies, the latter being of more recent growth than the former. A *terminating* society is one which by its rules is to terminate at a fixed date, or when a result specified in the same is attained; while a *permanent* society is one which has not, by its rules, any such fixed date or specified result at which it shall terminate. The amount of the shares in either case is raised by periodical (generally by monthly) subscriptions; any member may, on the security of freehold, copyhold, or leasehold property, obtain loans from the society, in which case the amount of the subscriptions is raised so as to provide for interest and repayment of capital. It is a common practice for persons to become members for the sole purpose of borrowing. The liability of investing members is limited to the amount actually paid, or in arrear, on their respective shares, while the liability of borrowing members extends to the total amount of the subscriptions payable by them under the particular mortgage deed, or under the rules of the society. Members may generally withdraw their shares on terms specified in the rules. The societies called *Bovkett* societies are terminating societies, making advances to their members which are repayable within a fixed time without any interest. The rotation of the members is determined by ballot. It is obvious that this system gives an undue advantage to those members who obtain advances in an early stage of the society's progress, and this inequality has been modified by the *Starr-Bovkett* societies. Every building society is regulated by rules which must contain certain particulars enumerated in the act of 1874. These rules must be examined by the registrar of friendly societies, who, after being satisfied that they are in accordance with the requirements of the law, grants a certificate of incorporation. The act authorises building societies to take deposits and generally to obtain loans within certain limits, it requires that every deposit-book or acknowledgment, or security of any kind given for a deposit, or a loan by a society, shall have printed or written therein or thereon the sections of the act relating to the liability of the members, and the regulation of the borrowing powers. Building societies may hold land as far as it is necessary for their purposes; summary remedies in the county court are given against defaulting officers, and there are special facilities offered for the criminal prosecution of persons defrauding such societies. On the repayment of a loan by a

member no formal reconveyance of the mortgaged property is necessary. Building societies are, when necessary, wound up by the county court of the district in a manner similar to that directed by the Companies Acts for joint-stock COMPANIES. Building societies registered under the act of 1836 were authorised to take out certificates of incorporation under the new act, and most of them have availed themselves of this privilege, but some unincorporated societies are still in existence. Besides these there are also co-operative building societies, which are not essentially different from other co-operative societies. The difference between building societies and joint-stock companies is pointed out in a very lucid manner by the royal commissioners (whose report, published in 1872, preceded the passing of the act of 1874). They point out that, while in a joint-stock company the leading idea is *capital*, *membership* is the essential principle of a building society. "In the building society the capital is never fixed. The number of shares is always indefinite, and the share has no permanence. The capital is constantly increasing by the addition of new shares, or decreasing by the withdrawal of existing ones. . . . Its membership remaining always open, it knows no share jobbing, fattens no brokers, and needs no settling day on the Stock Exchange. . . . The two forms of undertaking, we venture therefore to think, have an equal right to subsist, the one for the use of them who seek to make capital, the others for those who, having made it, seek to use it." The antithesis of the last sentence is not quite accurate from the economical point of view; it might be more correct to say that the building society gives an opportunity to invest savings which are gradually accumulating, while the joint-stock company as a general rule does not offer the same facilities for that purpose; but the main point is that the building societies absorb the savings of a class of investors who, as a rule, could not invest in the shares of joint-stock companies. It is right that societies established for this purpose should enjoy certain facilities not accorded to ordinary joint-stock companies, but special care should be taken, on the other hand, that the funds so provided should be managed by competent, prudent, and honest persons, and that the safety of the capital should be considered of greater importance than a high return of interest. Recent judicial decisions have established the principle that the directors of building societies have, in the absence of any special rules, the same freedom of action as the directors of financial companies. This principle, though it may be in accordance with the words of the statute, does not harmonise with the ideas expressed by the commissioners, which the Building Societies Act was intended to

embody, and the interference of the legislature would be clearly desirable. The following figures illustrate the growth of building societies. Those under the year 1870 are derived from the commissioners' second report, and are partly based on estimate, those under the year 1888 are derived from the last parliamentary return, dated 23d July 1889. Some societies do not make returns, or only return certain items, but it may be taken for granted that the bulk of the societies not making any return are either insolvent or have no business. The number of societies making returns on each particular item are added in square brackets :

		Number of Societies.	Members.	Annual Receipts.
England	{ 1870	2000	800,000	£11,000,000
	{ 1888	2444	582,866 [1940]	19,480,489 [2146]
Scotland	{ 1870	88	20,635	1,000,000
	{ 1888	50	8968 [37]	403,617 [44]
Ireland	{ 1870	17	3,836	no estimate
	{ 1888	51	12,310 [44]	531,751 [44]

		Due to investing Members.	Liabilities on Loans and Deposits.	Total Assets.
Eng.	{ 1870	£9,000,000	£6,000,000	£17,000,000
	{ 1888	34,705,963 [2157]	14,734,511 [2157]	51,218,823 [2157]
Scot.	{ 1870	823,282	474,916	1,500,000
	{ 1888	729,970 [45]	242,198 [45]	1,011,961 [45]
Irel.	{ 1870	419,984	147,139	no estimate
	{ 1888	680,816 [4]	248,314 [4]	991,514 [4]

TABLE showing number of Societies whose returns show amounts exceeding £100,000 under any of the heads named [this table is confined to England].

	Annual Receipts.	Due to investing Members.	Liabilities on Loans and Deposits.	Total Assets.
1870	10	8	8	13
1888	26	44	17	64

It will be seen that in England the number of members has actually decreased, while the increase in the number of societies is very small

in comparison with the increase of business done. The figures seem to point to the fact that a much wealthier class of shareholders have come in since the passing of the act. In Scotland there is a marked decrease, in all the figures in Ireland there is a steady increase.

E. S.

BÜLAU, FRIEDRICH VON (1805-1859), a German economist of note, was born at Freiberg, he studied at Leipsic, where he became, in 1833, professor of philosophy, and in 1840 of political science, filling the latter chair till his death. He held from 1837 the censorship of the periodical press. He took a prominent part in the propagation of the doctrines of ADAM SMITH in Germany. His principal economic writings are—*Encyclopedie der Staatswissenschaften*, 1832; *Der Staat und der Landbau*, 1834; *Der Staat und die Industrie*, 1834; *Handbuch der Staats-wirtschaftslehre*, 1835; *Die Behörden in Staat und Gemeinde*, 1836. He was a writer of no mean ability, though taking only a second rank among the economists of his time. "He has not," says ROSCHER, "the keen analysis of HERMANN, the learned thoroughness of RAU, nor the exact observation and creative fancy of VON THÜNEN. Even such of his books as were intended as manuals for instruction have the tone of essays or good leading articles; and he devotes himself rather to the discussion of the practical questions of the day than to the examination of fundamental principles." He advocated the most unlimited freedom of the individual in the economic sphere, and insisted that the state must not interfere with competition, or prescribe to citizens the way in which they should pursue their own interest. He thought the most important office of political economy was to reverse the mistaken policy of the past, which impeded the operation of natural laws. He was, in particular, strongly in favour of removing the legal fetters which, in his time, in Germany restricted the alienation of land. (Roscher, *Nat. Oekon. in Deutschland*, p. 902).

J. K. I.

BULL. A term usually applied to a buyer on borrowed money. The term on the stock exchange distinguishes the speculator for the rise from the pure investor. The latter buys a stock, pays at the date of settlement; the bull pays a rate of interest in order to "continue" his bargain till the next settlement. "Bull" is the opposite to a "Bear" (see BEAR and CONTANGO).

A. E.

BULL OF BORGIA. A bull issued in 1493 by Pope Alexander VI. professing to grant to the crown of Castile and Aragon all lands discovered, or to be discovered, beyond a line drawn from pole to pole, 100 miles west from the Azores—the crown of Portugal to have all lands eastward of such line. All lands previously occupied by any Christian king were excepted. The object of the bull was to confer a monopoly

of trade with the new world on Spain and Portugal.

J. E. C. M.

[For copy of the bull, see *Bullarium Magnum Romanum* (Luxembourg, 1727).]

BULLION. The precious metals **GOLD** and **SILVER** (*q.v.*) are generally spoken of as bullion when at or near the standard fineness accepted at the mints of the different countries of the world (see **STANDARD**). The term is sometimes applied, with some qualifying epithet, to ores containing only a very small portion of the precious metals, which are called "doré bullion" or "base bullion," etc. A statement in the report of Mr. J. P. Turnbull, director of the U.S. mint, on the production of the precious metals in the United States, pp. 14-15 (1887), will explain this. The reference in it is to certain ores found in Mexico more or less argentiferous, the value of which "has been generally estimated in Mexico by the assay of the precious metals, or of silver to the exclusion of the minute proportion of gold" contained in the ore; the base metals not entering into the estimated value. The report then refers to "the small tenor of gold extracted from doré bullion." The metallic compound is then termed "doré bullion" or "base bullion" according to the proportion of the metals of which it is composed—mainly silver or lead, but the term bullion is properly applicable to the precious metals alone (see **BILLON**).

[See Reports of the Deputy Master of the Mint, London.—Reports of the Director of the Mint, United States, Washington.—Reports on the Production of the Precious Metals in the United States, Washington, etc.]

BULLION COMMITTEE, REPORT OF. The Report of the Select Committee of the House of Commons on the High Price of Gold Bullion, ordered to be printed 8th June 1810, deserves notice from (1) the circumstances which led to the appointment of the committee; (2) the information and opinions expressed in the Report; (3) the controversy which the publication of the Report called forth; and (4) the influence which resulted on the financial policy of the country. (1) The note circulation of the Bank of England had expanded from an average of about 10 to 11 millions in 1795 to nearly 20 millions in 1809. Specie payments having been suspended 1797, and the paper circulation having been increased, the foreign **EXCHANGES** became unfavourable to this country, and the paper circulation was depreciated in comparison with gold (average depreciation of value of currency 13·5 per cent 1810.—Mushet); gold in bars being at the price of from £4:10s. to £4:12s. per oz. in the early months of 1810, at that date about 15½ per cent above the mint price of £3:17:10½ per oz. (2) The Report expressed the opinion that the divergence then observable between the gold and the paper was caused by an over-issue of the latter, and

that it was "difficult to resist the inference that a portion at least of the great fall which the exchanges lately suffered must have resulted, not from the state of trade, but from a change in the relative value of our domestic currency." The remedy then suggested was "That the system of the circulating medium of this Country ought to be brought back, with as much speed as is compatible with a wise and necessary caution, to the original principle of Cash payments at the option of the holder of Bank paper." (3) A sharp controversy was excited by these resolutions of the committee. The directors of the Bank of England had stated to the committee "a doctrine, of the truth of which they professed themselves to be most thoroughly convinced, that there can be no possible excess in the issue of Bank of England paper so long as the advances in which it is issued are made upon the principles which at present guide the conduct of the Directors, that is, so long as the discount of mercantile Bills is confined to paper of undoubted solidity, arising out of real commercial transactions, and payable at short and fixed periods" (Report, High Price of Gold Bullion, § 3). The Report of the Bullion Committee was printed 20th June 1810, the day before the prorogation, hence it was not considered till the next session, when it "was made the ground for a set of sixteen resolutions, moved in the House of Commons 6th May 1811, by Mr. HORNER, the chairman of that committee; the last of these resolutions being in pursuance of the recommendation in the Report, to make it imperative on the Bank to resume cash payments at the end of two years. A counter set of resolutions was moved by Mr. VANSITTART; the third of them being the memorable one 'That the promissory notes of the Bank of England have hitherto been and are at this time held to be equivalent to the legal coin of the realm.' The rival resolutions of Mr. Vansittart, including this last, which has been a standing topic of ridicule ever since, were carried on the 9th of May, by a majority of 151 to 75" (Tooke, *History of Prices*, vol. iv. p. 99). The vote on this occasion was doubtless influenced far more by a belief that it was inexpedient to bind the Bank to resume cash payments in so short a period, irrespective of the question whether peace were restored at the end of that time or not, than by any conviction as to the truth of the opinion which Mr. Vansittart maintained, contrary to the evidence given before the committee. (4) The influence of these proceedings on the financial policy of the United Kingdom was considerable, as they had great weight with Sir R. PEEL in 1844, when introducing the Bank Act of that year. He referred to the appointment of this committee in his speech, 6th May 1844, as follows—"In 1810 men of sagacity observed that the exchanges had been, for a considerable

period, unfavourable to this country, more unfavourable than could be accounted for by the balance of trade or the monetary transactions of this country." Sir R. Peel, after defining the pound sterling and the standard, continued his observations on the MEASURE OF VALUE and the coinage, stating "that in using the word money, I mean to designate by that word the coin of the Realm and promissory notes, payable to bearer on demand," adding, "I think experience shows that the paper currency, that is, the promissory notes payable to bearer on demand, stands in a certain relation to the gold coin and the foreign exchange in which other forms of paper credit do not stand. There are striking examples of this adduced in the Report of the Bullion Committee of 1810." Sir R. Peel proceeded to argue, basing his theory on facts shown to exist during a period of suspension of specie payments, contrary, as he admitted, to "the high authority of ADAM SMITH and of RICARDO," that "convertibility into coin at the will of the holder" was "not an adequate security against the excessive issue of promissory notes." Hence we may trace the theory on which Sir R. Peel based the act of 1844, to the interpretation he put on the Report of the Bullion Committee (see BANK NOTE, BANK OF ENGLAND, CURRENCY DOCTRINE, etc.)

[Report, together with minutes of evidence and accounts, from the Select Committee on the High Price of Gold Bullion (ordered by the House of Commons to be printed, 8th June 1810). For the history of the controversy mentioned see *The High Price of Bullion a Proof of the Depreciation of Bank Notes*, D. Ricardo, London, 4th ed., 1811, with Appendix, the most complete edition. In this pamphlet Ricardo showed conclusively that the value of the note was depreciated from excess of issue.—*Practical Observations on the Report of the Bullion Committee*, Chas. Bosanquet, London, 1810; the ablest of the pamphlets in opposition to the Report.—*Reply to Mr. Bosanquet's Practical Observations on the Report of the Bullion Committee*, D. Ricardo, London, 1811; a complete answer, based on a knowledge both of the theory and the practice of the subject.—*The Question respecting the Depreciation of the Currency Stated and Examined*, by William Huskisson, M.P., London, 1810, and included in *Private Reprints*, by Lord Overstone, 1857, with other "Select Tracts on Paper Currency."—*History of Prices, 1792-1856*, Tooke and Newmarch, London, v.d., see particularly vols. i. and iv., specially interesting as contemporary history.—*Thoughts and Details on the High and Low Prices of the Thirty Years from 1793 to 1822*, London, Thomas Tooke, 2d ed., 1824; to a great extent incorporated with the preceding, but also interesting.—*A Series of Tables Exhibiting the Gain and Loss to the Fundholder arising from the Fluctuations in the Value of the Currency from 1800 to 1821*, Robert Mushet, London, 1821; the standard work of reference on this subject.]

BUONARROTI, PHILIPPE (1761-1837), com-

munist conspirator and writer, was born at Pisa. He became a student of literature, and was for a time in high favour at the Tuscan court. His enthusiasm for the French Revolution led, however, to his banishment. He retired to Corsica, and served French interests so well there that when he came to France the Convention created him a Frenchman by decree. He associated himself with the Jacobins, and became one of the chief leaders of the conspiracy of BABEUF (q.v.). For this he was condemned to transportation, but the sentence was never carried out, and, after imprisonment and detention in several places, he was allowed in 1806 to leave France. He established himself first at Geneva, and afterwards in Belgium, where he supported himself by composing and teaching music. In 1828 he published at Brussels his *Conspiration pour l'égalité dite de Babeuf, suivie du procès auquel elle donna lieu et des pièces justificatives*, etc., which contains the most complete scheme for the actual establishment of communism, as distinguished from the description of a mere ideal state, that has ever been put forward. The author ascribes the whole scheme to Babeuf, but there can be little doubt that this is to a great extent a literary fiction, and that the scheme is mostly his own (see COMMUNISM). He returned to Paris in 1830.

A letter from him to J. Bronterre O'Brien comparing the schemes of Babeuf and Owen is quoted in Holyoake's *History of Co-operation*, vol. i. p. 258. A translation of his *Conspiration* was published by O'Brien in 1836, and had some circulation among the Chartists (Holyoake, *Hist. of Co-operation*, vol. i. p. 44). E. C.

BUQUOY, GEORG FRANZ, Count, was born at Brussels 1781, and died at Prague 1851. Proficient in several sciences, Buquoy endeavoured to apply mathematics to political economy in his—

Theorie der Nationalwirtschaft, 1815; supplemented by *Das national-wirthschaftliche Princip*, 1816.—*Erläuterung einiger eignen Ansichten*, 1817.—*Begründung des Begriffs von reellem Werth*, 1819.—(The author's ethical and political principles are set forth in *Skizze*, 1819.—His views on currency, in *Ein auf echten Nationalcredit fundirtes Geld*, 1819).—See Wurzbach, *Biographisches Lexicon des Kaiserthums Österreichs*. F. Y. E.

BUREAU OF LABOUR. In large industrial communities the establishment of a department of government dealing specially with the numbers, movements, and condition of the working classes has been recommended for two reasons: (1) in the interest of the state itself, to furnish information which may guide the legislature; (2) in the direct interest of the working classes, that employers and employed may be brought together, and workers may go where they are most wanted and best paid (see BOURSE DU TRAVAIL). The existing bureaux

confine themselves to the first object. The second seems better secured by well-organised trades societies than by a bureau of labour, which might be used against them in labour disputes. Even a purely statistical bureau, if its figures are to be full and trustworthy, must be above suspicion of collusion with employers; and this requisite seems best fulfilled by the appointment of a representative of the working classes on the staff of officials. England since 1886 has had a "labour correspondent," under the board of trade; and the present holder of the office was a well-known trades unionist. Switzerland has not only a bureau of labour, but a labour secretary of state, in close connection with the trades societies of the republic. Germany has no separate labour bureau, but the collection of labour statistics is carried on by the general statistical bureau with great carefulness, in view of the administration of the workmen's insurance acts. The experiment is being tried on a large scale in the United States, where there is a national bureau at Washington (established 1884), and more than twenty of the states have also established bureaux, the earliest being Massachusetts (1869) and Pennsylvania (1872). (See BUREAU OF LABOUR IN THE UNITED STATES.) The formation of an International Bureau of Labour was suggested in connection with the Labour Conference held at Berlin in March 1890; but the project remains as yet unrealised.

[See Report, Board of Trade, *Relation of Wages in certain Industries to the Cost of Production* (T. H. Elliott), 1891.] J. B.

BUREAU OF LABOUR IN THE UNITED STATES. *History.*—In 1869 the state of Massachusetts established a bureau of statistics of labour. In 1872 Pennsylvania organised a bureau of industrial statistics. Neither of them seems to have been owing to any demand on the part of labour organisation. But after the great railroad strikes of 1877, bureaux were established in rapid succession in Ohio (1877), in New Jersey (1878), in Illinois, Indiana, and Missouri (1879). A little later the powerful organisation known as the KNIGHTS OF LABOUR made the establishment of such bureaux one of their "demands," and they were organised in New York, California, Michigan, and Wisconsin (1883); Iowa and Maryland (1884); Kansas and Connecticut (1885); Maine, Minnesota, Colorado, North Carolina, Rhode Island, and Nebraska (1887). A national bureau of labour was established 18th January 1885, which became the department of labour in 1887. Its head (commissioner of labour) is not, however, a cabinet officer.

The main object of all these bureaux is to investigate the condition of the labouring class. The Massachusetts statute, which has been followed in most of the other states, reads as follows:

"The bureau shall collect, assort, arrange, and present in annual reports . . . statistical details relating to all departments of labour in the Commonwealth, especially in relation to the commercial, industrial, social, educational, and sanitary condition of the labouring classes," etc.

In many of the states (*e.g.* N.J., Penn., Ind., Ill., Wis., Ia., Kan., and Neb.) the bureau is also a bureau of industrial statistics, and is expected to collect and publish information relating to the chief industries of the state.

In Wisconsin and Missouri the commissioner of labour is also the chief factory inspector, and in Illinois the board of labour commissioners appoint the inspectors of mines.

The *financial resources* of most of the bureaux are extremely meagre; the officers consist of a chief and one or two clerks; and only a few hundred, or at most a few thousand, dollars are allowed for the work of gathering statistics.

The *legal powers* are not extensive; for although in many states penalties are prescribed for refusal to give the information demanded by the bureau, yet these penalties are seldom enforced. Most of the bureaux simply send out circular schedules to employers of labour, a large proportion of which are never answered.

The *scientific value* of the reports of the state bureaux is very unequal. Those of Massachusetts (twenty-three in number) form an extremely valuable series, and contain the best information we possess in regard to the condition of American labour. The New Jersey and Illinois reports also contain valuable information. The others are of little consequence.

The national bureau (department) of labour is better equipped than any of the state bureaux. It undertakes special investigations and has published reports on The Depression of Trade (1886); Strikes and Lockouts (1887); Convict Labour (1888); Marriage and Divorce (1889); Working-women in Great Cities (1889); Cost of Production (1890); and Condition of Railroad employés (1890).

[Reports of the various bureaux (generally annual, in some cases biennial).—Proceedings of convention of the chiefs of labour bureaux (annually since 1883).—*Political Science Quarterly*, vol. i. 1886, pp. 45 *seq.* and 438 *seq.*]

R. M.-S.

BUREAUCRACY. The administration of many branches of business, public and private, by functionaries centralised in *bureaux* (whence the name is derived), is the rule in most of the important countries of Europe. It is less the case in Great Britain and Ireland than on the continent,—but the complex character of the requirements of modern life, and especially the aggregation of large masses of the population in cities, have called, in recent times, for increased superintendence in matters of health, police, education, etc. W. BAGEHOT, in his work on *The English Constitution*, describes the advan-

tages and the defects of a highly organised bureaucracy very clearly. The necessity for organisation requires no explanation—on the other hand, as Bagehot remarks, the defects of bureaucracy are well known: "It is an inevitable defect, that bureaucrats will care more for routine than for results; or, as Burke put it, that they will think the substance of business not to be much more important than the forms of it." Their whole education and all the habit of their lives make them do so. Men so trained must come to think the routine of business not a means but an end; to imagine the elaborate machinery of which they form a part, and from which they derive their dignity, to be a grand and achieved result, not a working and changeable instrument.

An over-organised "bureaucracy tends to under-government, in point of quality; it tends to over-government in point of quantity." The risk is that it comes to be considered that "the functionaries are not there for the benefit of the people, but the people for the benefit of the functionaries." Yet, though this risk is well known—the weakness of separate individuals when dealing with the organised forces of powerful companies and corporations, has been felt to be so dangerous and the necessity for providing for the health, the protection, and the instruction of the masses, the feeble, and the young, to be so great, that the tendency of the day is towards increasing the power of official superintendence and inspection. In the words of JEYONS (*The State in Relation to Labour*, p. 166), "there can be no royal road to legislation in such matters. We must consent to advance cautiously step by step, feeling our way, adopting no foregone conclusions, trusting no single science, expecting no infallible guide. We must neither maximise the functions of government at the back of quasi-military officials, nor minimise them according to the theories of the very best philosophers. We must learn to judge each case upon its merits, interpreting with painful care all experience which can be brought to bear upon the matter." The gradual growth of this opinion is characteristic of modern thought. H. SIDGWICK (bk. iii. of his *Principles of Political Economy*, ch. ii. "The system of Natural Liberty considered in relation to Production"), while weighing carefully the advantages and disadvantages of governmental interference, observes "first, that these disadvantages are largely such as moral and political progress may be expected to diminish; so that even where we do not regard the intervention of government as at present desirable, we may yet look forward to it, and perhaps prepare the way for it. And, secondly, even where we reject governmental interference, we may yet recognise the expediency of supplementing or limiting in some way or other the results of private enterprise." Again, on the cognate

subject of LAISSEZ-FAIRE, we find CAIRNES, in his essay on "Political Economy and Laissez-faire," *Essays in Political Economy, Theoretical and Applied*, saying, "the maxim of *laissez-faire* has no scientific basis whatever, but is at best a handy rule of practice, useful perhaps as a reminder to statesmen on which side the presumption lies in questions of industrial legislation, but totally destitute of all scientific authority." Compare with this the sterner teaching of J. S. MILL (*Principles of Political Economy*, bk. v. ch. xi., "Limits of the Province of Government")—"Even if the government could comprehend within itself, in each department, all the more eminent intellectual capacity and active talent of the nation, it would not be the less desirable that the conduct of a large portion of the affairs of society should be left in the hands of the persons immediately interested in them. The business of life is an essential part of the practical education of a people, without which book and school instruction, though more necessary and salutary, does not suffice to qualify them for conduct, and for the adaptation of means to ends" (see LAISSEZ-FAIRE).

BURET, ANTOINE EUGÈNE, born at Troyes 1810, died at Paris 1842. He wrote in the *Courrier français*, and the *Journal des économistes*. But what, during his short career, won for him chiefly the esteem of the economic world, is, notwithstanding the manifest tendencies the book contains towards the opinions of the then rising socialist school, his work, *De la Misère des classes laborieuses en Angleterre et en France* (2 vols. in 8vo). This book is the expansion of an essay which obtained for the author the sum of £100—the half of the quinquennial prize (Félix de Beaujour), in 1840 awarded by the *Académie des Sciences morales et politiques*; it is written with vigour, and in a conscientious spirit, and is attractive to read, though the author, by representing exceptional cases as the general rule, has drawn too gloomy a picture. Buret also revised, in conjunction with J. A. BLANQUI, the translation of Smith's *Wealth of Nations* by G. GARNIER, in the "Collection Guillaumin." A. C. F.

BURGH, a word used in Scotland for the same purposes as the word BOROUGH (*q.v.*) in E. S.

BURGHER. See CITIZEN.

BURIDAN, JEAN, rector of the university of Paris in 1327, alive in 1358, a celebrated philosopher, discusses the "commutation of moneys" and interest in his—

Questiones super decem libros ethicorum Aristotelis. F. Y. E.

BURKE, EDMUND, born 1728 or 1729, died 1797. A rich vein of economic wisdom, mixed with other precious materials, runs through the whole vast tract of Burke's political writings. The mine is deepest, or

at least the ore purest, in the *Thoughts on Scarcity*, dated 1795. Here Burke enunciates general principles worthy of the *Wealth of Nations*, though perhaps not derived from that source, if it be true, as Prior relates, that Adam SMITH described Burke as "the only man he had met with who thought as he did on the chief topics of political economy without previous communication." Burke says, "Labour is a commodity like every other, and rises or falls according to the demand." The rate of wages thus determined "has no direct relation" to the price of provisions. "The balance between consumption and production makes price. The market settles, and alone can settle, that price. . . . Nobody, I believe, has observed with any reflection what market is without being astonished at the truth, the correctness, the celerity, the general equity, with which the balance of wants is settled." Burke extols "the laws of commerce which are the laws of nature, and consequently the laws of God." He condemns the "political canting language" of those who speak compassionately of the "labouring poor." Similar reflections occur in the third letter on a *Regicide Peace*. There Burke says "to force any market is of all things the most dangerous." And again, "the love of lucre is the grand cause of prosperity to all states." Just views as to the nature of foreign trade are to be found in several places. *Two Letters to Gentlemen in the City of Bristol* denounce the restrictions on Irish trade. In a letter on a proposed Irish ABSENTEE Tax, Burke says, "No man living loves restrictive regulations of any kind less than I; at best, nine times in ten, they are little better than laborious and vexatious follies." The fallacies of the mercantile theory did not ensnare Burke. "To state the whole of the foreign import as loss is exceedingly absurd." Wealth "consists in the stock of useful commodities as much as in gold and silver" (*Observations on a Late State of the Nation*). However, Burke seems not altogether to disapprove of the laws restricting the commerce of America. "I am sure they are still, in many ways, of great use to us; and in former times they have been of the greatest" (*Speech on Conciliation with America*). Indeed he appears to treat the BALANCE OF TRADE as not absurd (Third Letter on a *Regicide Peace*). He is no bigoted preacher of *laissez-faire*. He says:—"It is one of the finest problems in legislation . . . what the state ought to take upon itself to direct by the public wisdom, and what it ought to leave, with as little interference as possible to individual discretion. Nothing, certainly, can be laid down on the subject that will not admit of exceptions, many permanent, some occasional" (*Thoughts on Scarcity*). In fine, Burke never forgets that wealth is but one element of well-

being, and not to be separated from "the great contexture of the mysterious whole."

The *Thoughts and Details on Scarcity* were published posthumously in 1800, with an interesting preface by the editors. The groundwork of the *Thoughts and Details* consists of a memorial addressed to PITT in 1795; with which the editors in 1800 have incorporated fragments of a letter addressed to Arthur YOUNG concerning "rural economics." The *Thoughts and Details* are to be found, along with the other writings referred to above, in the collective editions of Burke's works; of which there are several, the best perhaps being that of 1852, "Works and Correspondence" in eight volumes. F. Y. E.

BURLAMAQUI, JEAN JACQUES (b. 1694, d. 1748), professor of law at Geneva, has some striking remarks about the dependence of price on rarity and utility in his *Éléments du droit Naturel*, 1775 (part iii. ch. xi.) The substance of this work appeared in another form under the title *Principes du droit de la Nature et des Gens*, with matter added by the editor, Prof. de Felice, 1766; new edition, 1820. The remarks of Burlamaqui on value have been quoted by WALRAS, *Éléments de l'Économie Politique*, 2d éd. Leçon xvi. F. Y. E.

BURTON, J. HILL. See HILL BURTON, J.

BÜSCH, JOHANN GEORG (1728-1800), was, as ROSCHER says, the best representative of liberal tendencies among the German eclectic economists in the last thirty years of the 18th century. Materials for the history of his life are supplied by his autobiography (*Ueber den Gang meines Geistes und meiner Thätigkeit*). He was born in the territory of Lüneburg, and accompanied his father in 1731 to Hamburg, where he resided, except during his student-years at Göttingen and occasional absences, till his death. He is described as an excellent man, disinterested, independent, frank, modest, and industrious, and a good citizen, devoted to the interests of his adopted city. He was professor of mathematics in the local gymnasium, and conducted a trade academy at Hamburg which celebrated its centenary in 1867. He had a very high reputation in Germany; LÜDER speaks of him as "our greatest political writer," but this is a somewhat exaggerated estimate. Roscher characterises him as "a cultivated, experienced, and right-minded man, disinclined to all doctrinaire one-sidedness and practical extravagance." He is an original writer, but has not the art of orderly arrangement and clear exposition. His views were formed rather by experience and observation than by the study of books. The economic theorist whom he most valued was STEUART; he shows a certain captiousness and even bitterness towards Adam SMITH, whom he considered to be popularly over-rated. He is, however, more favourable to FREE-TRADE than most of his German predecessors, and protests against the "hot-bed cultivation" of certain branches of production at the

cost of the community. He unfortunately fell into the mistake (indicated by the title of his principal work, *Abhandlung von Geldumlauf*, 1780) of regarding economic phenomena with reference not to wants and their satisfaction, but to the circulation of money, a view which dominates the whole circle of his ideas. This confuses much of his reasoning, obscures the deeper and more essential facts of economic life, and tends to lead him back into the errors of mercantilism, from which, accordingly, he is only partially free. His most permanently valuable writings are probably his treatise on universal commerce (*Entwurf einer Geschichte der merkwürdigsten Welthandel neuerer Zeit*, 1781) and his history of the trade of Hamburg (*Gesch. der Hamburgischen Handlung*, 1797), in which he shows a thorough familiarity with the course of trade and the commercial relations of different countries (Roscher, *Gesch. der Nat. Oek. in Deutschland*, p. 559). J. K. I.

BÜSCHING, ANTON FRIEDRICH (1724-1793), was one of the two most distinguished German statisticians of the 18th century, ACHENWALL being the other. Like the latter, he belongs, as regards his economic opinions, to the more liberal branch of the mercantilist school. The work on which his reputation chiefly rests is his *Vorbereitung zur Europäischen Länder- und Staatskunde*, 1759. He rendered an important service by initiating in his *Neue Erdbeschreibung* the new "politico-statistical" method in geography, which supplies full information on the natural resources and capabilities, the industry and trade, the political system and general culture of each of the countries described. J. K. I.

BUTEL-DUMONT, GEORGE MARIE, was born at Paris in 1725, and died towards the end of the 18th century. By profession he was an advocate, and was appointed secretary to the French embassy at St. Petersburg. His works are chiefly concerned with colonial and commercial history. He is said to have assisted GOURNAY in translating CHILD's *New Discourse of Trade* (1754). He translated and enlarged the *Discourse on Trade* of John CARY (*Essai sur l'État du Commerce d'Angleterre*, 2 vols. 1755). The best known of his works is the *Théorie du Luxe, ou traité dans lequel on entreprend d'établir que le Luxe est un ressort non-seulement utile, mais même indispensablement nécessaire à la prospérité des États*, two parts, 1771. This does not, however, merit the praise sometimes bestowed upon it; it is a superficial apology for luxury without any originality, attacking the "Tableau hiéroglyphique" of the economists, and their theory of the detrimental influence of luxury (pt. ii. p. 36), ridiculing the definite sense they give to it, though confessing their merits in other respects (p. 39).

His other works are: *Mémoires historiques sur la Louisiane*, 1753.—*Histoire et Commerce*

des Colonies Angloises dans l'Amérique Septentrionale, 1755.—*Histoire et Commerce des Antilles Angloises*, 1758.—*Acte du Parlement d'Angleterre, connu sous le nom Acte de Navigation*, traduit de l'Anglois, 1760.—*Conduite des Français par rapport à la Nouvelle-Ecosse* traduit de l'Anglois (of Jeffreys), 1765.—*And Recherches sur l'administration des terres chez les Romains*, Paris, 1779. (See M'Culloch, *Littérature*, pp. 34, 46, 223.) A *Traité de la circulation et du crédit*, is sometimes ascribed to Butel-Dumont, Amsterdam, 1771. But the author of this tract is Isaac de PINTO, who, like Butel-Dumont, had written an *Essai sur le luxe*. S. B.

BUTLERAGE. A commuted toll or tax, paid in specie, from about the year 1802 onwards, at a fixed rate upon every cask of wine imported into England by alien traders—part of the additional duties termed the new or small customs, as opposed to the ancient or great customs granted in 1275—*nova sive parva custodia*—as opposed to *antiqua sive magna custodia*. This duty, as such, ceased to be levied 5th July 1809, by the Customs Consolidation Act, 49 Geo. III. c. 98, § 36. The duty was in commutation of the rights of the king's butler (see PRISAGE).

[Dowell, *History of Taxation*, 2d. ed. vol. i. p. 80; vol. ii. p. 237.—H. Hall, *The Customs Revenue of England*, ed. 1885, vol. ii. p. 92.]

BUYING IN. A transaction known only to the stock exchange, where, if a member has sold stock, shares, or other securities, which he fails to deliver on a stipulated date, the buyer is at liberty to purchase from any other member of the stock exchange, and to claim against the original seller the difference between the two prices, supposing the latter to be higher than the original contract price. This is the process: the buyer who claims stock, employs the official broker of the stock exchange to "buy in" against the member failing to deliver. That is, open tenders of stock are invited; and he who sells must be prepared to deliver immediately. A. E.

BY-LAW, BYELAW. A regulation of a municipal or other local authority, or of any corporation, for the management of its internal affairs. The word is also, but much less frequently, used in the sense of additional or secondary law. It is probably derived in the same manner as the archaic word byr-law, which is still to be found in some dialects in the original sense of law or custom of a TOWNSHIP or MANOR, "byr" (Swedish and Danish=by) being the old Norse word for dwelling-place, township, etc. The power of municipal corporations to make by-laws is now regulated by the Municipal Corporations Act, 1882, § 23, and that of local authorities under the Public Health Act, 1875, by §§ 182-188 of that act; those made by the former bodies may be disallowed by order in council; those made by the latter must be confirmed by the local government board.

The Local Government Act of 1888 gives county councils the same power of making by-laws in relation to their county as borough councils have in relation to their borough (§ 16). There are several statutes dealing with the power of railway companies to make by-laws, among which the Railway Regulation Act, 1840 (§§ 7-9) and the Companies' Clauses Act, 1845 (§§ 124-127) are the most important. The by-laws made by railway companies may be disallowed by the board of trade. E. S.

BY-PRODUCT. A by-product is one which is obtained incidentally, together with the product which it is the main object of a particular process to secure. Such products are met with in almost every industry; those connected with metallurgy will alone be considered, as they will serve for the purpose of general illustration. It is, however, often difficult to separate the results of a particular operation or process into the *main* and the *by-products*. For instance, in the conversion of coal into coke by certain modern methods, the tar, ammonia, benzol, and other organic substances are collected as by-products, but their value is very great when considered in relation to that of the coke which is the main product of the coke ovens. In the case of the metallurgical treatment of certain kinds of iron pyrites, or sulphide of iron, the mineral, which contains small quantities of copper, silver, and gold, is treated mainly with a view to the conversion of the sulphur it contains into sulphuric acid. The residue may then be considered to be a poor ore of copper, gold, and silver, but it is rich in iron, and is useful for certain metallurgical purposes. The iron can, however, only be considered to be a by-product, as it certainly would not have been possible to treat profitably the iron pyrites with a view to extract the iron it contained.

In the metallurgy of copper, gold, silver, lead, nickel, and cobalt, the associated metals are extracted as by-products, and during the extraction of silver from certain ores of lead and copper, small quantities of gold pass into the silver, and conversely a small quantity of silver is always associated with gold. The separation of a small amount of one precious metal from a large mass of another in which it is hidden may be effected very cheaply, and both the gold and the silver, in the respective cases, must be considered to be by-products. It has been estim-

ated that not less than 500,000 ounces of silver are annually extracted from gold, the silver being entirely a by-product, but, on the other hand, it would be a very difficult question to determine how far the 30,000,000 ounces of silver obtained by the desilverisation of lead ores, and the 7,000,000 ounces obtained during the treatment of copper ores, are by-products. The whole question of by-products is so extensive that it is not possible to do more than indicate its general nature.

[The special importance of the subject in reference to the production of the precious metals, and in particular of silver, is shown in great fulness of detail in the Memorandum by Professor Roberts Austen, F.R.S., Chemist to the Royal Mint, on the Cost of Production of Silver, laid by him before the Gold and Silver Commission, 1886.]

W. R.-A.

BY-PRODUCTS, THEORY OF VALUE OF. By-products may be considered as a special case of **JOINT-PRODUCTS** (*q.v.*); that in which one of the joint-products is of relatively small value. This incident does not invalidate the general theory that the prices of joint-products are such that (1) the supply of each commodity just meets the demand; (2) the net advantages of the producer are equal to those of any other occupation between which and the occupation under consideration there exists Industrial Competition. It is conceivable indeed that the gains incident to the by-product may be so small as not to exercise any influence in determining the flow of capital and labour to the occupation. Since the mobility of labour is subject to considerable friction, a very small motive which is not sufficient to overcome friction may produce not so much a small effect as none at all. Upon this view the prices of by-products would be determined only by the *first* of the conditions above stated. Their value would be altogether market as distinguished from normal value. This hypothesis hardly admits of verification. The "equation of net advantages" in different occupations (Marshall, *Economics of Industry*) is not in general fulfilled so exactly that it is possible to determine whether small items are, or are not, taken account of. It is at least safe to say that it is even more difficult to predict price in the case of a by-product as here defined than it is (Sidgwick, *Pol. Econ.* bk. ii. ch. ii. § 10) in the case of joint-products generally. F. Y. E.

CABET, ETIENNE, born at Dijon 1788, died at Saint Louis (Missouri), 8th November 1856. The son of a working man, he received in his first youth an education to correspond with his position in life. He soon, however, broke through these early trammels, and at the age of twelve attended the lectures of his fellow townsman, Jacotot, well known for his method of instruc-

tion, his own invention, which at the time was greatly in vogue. Here Cabet made such progress that he was able at fourteen to enter, as a teacher, the Lycée of Dijon. Public instruction appeared at that time to be the occupation he was likely to follow; but changing his course, he turned first to medicine, then to the study of the law, passed, 1812, as doctor *en droit*, and

took a distinguished position among the bar of the department of the Cote d'or. He became, 1815, founder and director of the *Fédération Bourguignonne* for the defence of the national territory, and mixed himself up with the party of the CARBONARI (*q.v.*) He appears to have derived his republican convictions from his father, who was a fiery patriot. About 1820-22 he fixed himself at Paris, and was specially appointed director of the *Vente Suprême*—the name given by the Carbonari to their political meetings. The Revolution of 1830 naturally found him in the first line of its adherents, and urging strongly, but in vain, the convocation of the *Assemblée Constituante*. Abandoning this cry, he consented, 1st August 1830, to be appointed general secretary to the ministry of justice, then, a few weeks later, *Procureur-général* in Corsica. Having offered himself as a candidate at the election for the legislature, he published a statement of his opinions which the government looked on as an attack on established institutions. His old comrade in carbonarism, M. Barthe, then minister of justice, dismissed him from his office. Two months later he was elected deputy for Dijon, and immediately made himself conspicuous among the democratic opposition. He published, among other things, a *Histoire de la révolution de 1830*; for this he was tried before a jury which acquitted him. After escaping a second time, when tried before another judge, he was less fortunate on a third occasion; and, in 1834, was condemned to two years' imprisonment for an article in which he accused the government of July of watching with anxiety for the moment when it could cannonade Paris. After a moment's delay he fled, first to Brussels, then to London, whence he did not return till 1839, when the period of his penalty had expired. He composed, in the last-named city, several historical compilations more or less revolutionary in tone, such as his *Histoire de la révolution française*, in which the most advanced adherents of the "mountain" were glorified, and their acts excused if not approved. Up to this date politics had absorbed him; he was converted to communism by reading the UTOPIA of Sir T. MORE; and he shortly became the most accredited high priest of that school of SOCIALISM, though his communism was not so thorough-going as might have been logically inferred from his principles.

He proposed, in the first place, a transitional period of fifty years between the actual régime and that which he dreamed of. The acts of the administration and the laws especially were to be framed so as to permit the definitive establishment of communism at the end of a half century. Successions to property, gifts, and transfers were to be severely scrutinised. Taxation was no longer to be levied on the poor, nor on objects of primary necessity, nor on labour. Wealth and superfluity, on the other hand, were

to be subject to PROGRESSIVE TAXATION. The pay of working people was to be fixed by law, and in a sense favourable to them. An amount of 500 millions frs. (20 millions sterling) was to be employed in supplying occupation to the working classes and dwellings for the poor. The army was to be suppressed as far as possible—the men dismissed from the ranks being indemnified and employed on public works till the whole of the force could be disbanded. Marriages among the working classes, the instruction and education of the rising generation, were to be encouraged and aided by an annual charge of 100 millions frs. (4 millions sterling) on the budget.

When the half century mentioned above had gone by every one of the age of sixty-five was to be exempt from work, and provided with a retiring allowance. At this date also complete communism was to begin—at least Cabet's communism. As it would be impossible to attain direct government on account of the extent of the country, resort was to be had to representative government, liberty of the press was to be absolutely suppressed, one single official journal being allowed to appear.

Work, according to his plan, is obligatory, according to strength and capacity, for all—for men from eighteen to sixty-five—for women from seventeen to fifty. Work is, besides, so agreeable in Icaria, as this fortunate country is named, that no one is ever lazy there. All working people are separated according to professions, and then employed in common workshops. Hence beyond question an abundance of products would result, marvellously diversified, and necessarily adapted to the various wants of the community,—made with the minimum of effort, rather only with pleasure, for such is the nature of work in the communism of Icaria,—and divided equally, regard being had to age and sex, among all the citizens, at least up to the point first of what was necessary, then of what was useful, finally of what was agreeable. What is the necessary, the useful, the agreeable? Cabet forgot to define all this.

But the family? Our communist is not able to suppress that, he maintains it. Less logical than PLATO, he thought he might abolish property and respect the rights of the family. Children were to know who was their father and their mother; to the mother the education of her child was absolutely entrusted up to five years old. It was only after this age that the state took charge of it to make of it a complete communist. Concubinage was forbidden, voluntary celibacy was branded as an act of ingratitude worthy of suspicion. All these attractive things and many more are to be found in a stout volume of from 500 to 600 pages called the *Voyage en Icarie*, which Cabet wrote in London, and published in Paris first in 1840. This ran through many editions.

The *Voyage en Icarie* is a romance into the web of which the whole of Cabet's peculiar system is interwoven. Everything is mixed up in it—political reflections, administrative decisions, the cleansing of the streets side by side with the laws concerning the organisation of labour. Municipal reforms come side by side with the solution of social problems. The city of Icaria is described with the utmost detail, and is, as may be supposed, a model city such as is not beheld in this individualistic world. Everything in it is polished, clean, and dusted. It is perfect down to the minutest detail; "the very dogs (p. 44) cause no scandal." The deputies who are late are to come in through a door specially set apart for them, and provided with a bell so that their entrance should be marked to their more exact colleagues. All these charming arrangements inflamed the imaginations of those unhappy wretches who trusted their lives to Cabet's system. For after having disseminated, ever since 1841, through the journal the *Populaire*, his dangerous doctrines, Cabet, to whose good faith we desire to do full justice, convinced in his own mind of the advantages to be derived from his system, bought a million acres of land in Texas, and sent forward sixty-nine trusty followers to carry out the Icarian doctrines in this domain. This first exodus took place 3d February 1848. The colonists reached New Orleans the end of March, and hearing there the news of the revolution of 24th February at Paris, hesitated for a moment to go forward, but finally resolved to make their way to the appointed rendezvous. This first attempt turned out most disastrously, and the disciples of Cabet, decimated by disease, made up their minds to return to the capital of Louisiana, marking their way with the corpses of many of their number, who sank victims of fatigue and disease. On reaching New Orleans they met Cabet, who had quitted Paris December 1848 to join them. The interview was stormy; bitter reproaches were addressed to the high priest of communism, who, however, was not disconcerted. In March 1849 the Icarians, numbering two hundred and eighty, including the new-comers, and having this time Cabet at their head, turned their steps to Nauvoo in Illinois, where they met with fewer trials than in Texas.

Meanwhile Cabet had been condemned to two years' imprisonment on a charge of fraud. There was obvious exaggeration in this charge. Cabet was a fanatic, not a rogue. He was indignant at the accusation; returned for a short time to France; appealed against the sentence, and had the good fortune to see it reversed by the court of appeal in Paris, 26th July 1851. On his return to Nauvoo he found his colony making progress; the numbers mounted up to five hundred in 1855.

Divisions, however, existed in this population,

which had few bonds of coherence. Many times a separation was thought of. At last it came; Cabet left Nauvoo at the head of some two hundred of his partisans, and soon after died at St. Louis. The cause of the split appears to have been that Cabet desired to induce the population to submit to an over-severe discipline, analogous to that of some convents of the Middle Ages. The colony of Nauvoo continued to exist, surrounded by difficulties of many kinds, up to 1880, after which date we have lost sight of it.

With respect to Cabet himself we may add, to complete what has been said as to his opinions on matters of a social character, that he is distinguished from communists of other schools in that he gives a quite peculiar religious form to his opinions. He connected his communistic convictions with the earlier ages of the church, and wrote on this subject several books, of which the most important has for its title the words, *Le vrai christianisme suivant Jésus-Christ* (1846), and for its conclusion, "Le communisme c'est le christianisme" (see COMMUNISM). A. C. F.

[For a fuller account of the Icarian colony in America, see Dr. Shaw's *Icaria* (1874) and Nordhoff's *Communistic Societies of the United States* (1875), pp. 333 *et seq.*]

CABLE TRANSFER. A telegraphic order from one banker to another to make a payment to a person or firm indicated in the cablegram. Cable transfers are most frequently used in the commercial intercourse between England and the United States of North America. Those bankers who are in the habit of transacting this class of business take very elaborate precautions, by means of codes and keywords, to avoid fraud. An ingenious chancellor of the exchequer a few years ago remarked that the revenue from bill stamps had fallen off on account of the frequent use of cable transfers, but this can hardly be borne out by the facts, as the bills which were formerly remitted by the persons who now make their payments by means of cable transfers are now used by the bankers to cover their friends for the payments they effect on their telegraphic order. E. S.

CADASTRAL SURVEY. A survey made for the purpose of compiling a public register of the quantity, value, condition, and ownership of the real property of a country. But the term is loosely applied to every official survey of the surface of a country. Thus DOMESDAY Book and the Ordnance Survey have alike been referred to as, in a sense, cadastral surveys. The purposes served by such surveys include the determination of the sums to be contributed to the revenue, or to any other common fund, by individual owners and occupiers of property, or by the community resident within any prescribed area; the registration of boundaries and of changes of ownership; the division and subdivision of a country into administrative and representative areas; and the arrangement of

schemes for public works, or drainage and other local improvements.

In the United Kingdom the general survey known as the ordnance survey was intended at first for purely military purposes, and, in particular, to provide plans for purely military purposes (hence the name the ordnance department); but as the real value of the work and the various uses which it might serve were perceived, the scheme expanded, and in England and Wales it is now proceeding on the following scale: Towns having 4000 or more inhabitants are surveyed on a scale of 1·500 of the linear measurement, which is equivalent to 126·72 inches to a mile, or $4\frac{1}{2}$ feet to an inch; parishes (in cultivated districts) 1·2500 of the linear measurement, equal to 25·344 inches to a mile, or 1 square inch to an acre; counties on a scale of 6 inches to a mile; kingdom, a general map 1 inch to a mile. The maps issued by the survey are largely used for evidencing the particular properties referred to in legal and other documents, for planning public and private works, and for the delimitation of boundaries. But the absence of any information as to the value of the property delineated—an essential element in a true cadastral survey—makes the ordnance survey inapplicable to purposes of taxation, and the system of land registration and transfer which such a survey renders possible has not yet been fully organised in the United Kingdom.

In France, cadastral survey has, since 1790, been a matter of great importance owing to the prominent position of the *contribution foncière* in the financial system of that country. The French literature of the subject is proportionately extensive. In Germany a fairly accurate cadastral survey has (1861-1864) been completed.

Adam SMITH (*Wealth of Nations*, bk. v. chap. ii. art. i.) gives some examples of cadastral surveys, and appears to think that the labour and expense they entail is out of proportion to their value. The point of view from which he is considering the subject is, however, that of taxation alone. The labour and delay incident to an adequate cadastral survey in England have been regarded as a fatal practical objection to schemes like J. S. MILL's for appropriating the UNEARNED INCREMENT of rent.

[See report of the progress of the ordnance survey to the 31st December 1886 (*Parliamentary Paper* [c. 5005]).—*Dictionnaire de l'Administration Française*, par M. M. Block (2d ed., 1881).—*Recueil Méthodique des lois, décrets, règlements &c. sur le Cadastre de France* (Paris, 1811).—*Du Cadastre et de la Limitation des Héritages*, par F. H. V. Noizet (Paris, 1861).—*Denkschrift über die Ausführung des Gesetzes vom 21st May 1861, betreffend die anderweitige Regelung der Grundsteuer* (Berlin, 1865).]

T. H. E.

CADET, FÉLIX, born at Paris 1827, died at Viroflay near Paris 1888. After brilliant pro-

gress in his university studies, he commenced his career as a professor, lecturing first on history, then on philosophy. He gave, 1866-67, with great success, a course of lectures on political economy, before the *Société Industrielle*, of Reims; and divided with HORN, in 1866, the *Léon Faucher* prize, given by the *Académie des Sciences morales et politiques* (*Pierre de Boisguilbert, précurseur des Économistes*, 1870, in 8vo). He then undertook a series of *conférences* (discussions) at Rheims, also under the wing of the *Société Industrielle* of that city, the object of these being to examine curiously the lives and criticise the works of BOISGUILBERT, VAUBAN, QUESNAY, TURGOT, SMITH, and FRANKLIN. After 1870 he gave himself up principally to teaching, a career which he pursued with great success, and died honorary inspector-general of public instruction. A. C. f.

CAGNAZZI, LUCA SAMUELE, born at Altamura, in the province of Bari, 1764, died 1852. By profession originally a teacher of mathematics, he was appointed, 1806, to a professorship in this study in the university of Naples. His life was full of trouble; having been concerned in political intrigues, he had to flee from Naples and, after wandering, nearly always on foot, through Italy and Switzerland, and after being imprisoned more than once, he had to seek refuge in Florence. He returned to Naples under Murat's government. After the change of government, he was elected deputy for Bari, and was President of the chamber on the 15th May 1848, when it was dissolved by the troops. To escape capture he fled again and returned to Florence, where he fell ill. Feeling his end at hand, and wishing not to die in exile, he obtained his pardon from the King of Naples, through the intervention of the Grand Duke of Tuscany. He deserves mention for having written on parallel CURVES, in a time when this method of demonstration had some novelty. As an economist he wrote, besides an *Essay on the population of the Realm of Naples*, *Saggio sulla popolazione del regno di Puglia ne' passati tempi e nel presente* (Napoli, stamperia Trani, 1820 and 1839, 2 vols. in 8vo), what was perhaps his most important work, in 1813, a little manual of political economy, *Elementi di Economia politica* (Napoli, stamperia S. Giacomo), and, 1827, a pamphlet on *La Scienza della economia politica* (Venice). Some years earlier he had published a manual of statistics: *Elementi dell' arte statistica*, Napoli, stamperia Flautina, 1808, 2 vols. In 1839 he published his latest statistical work: *Sullo stato della Statistica nel Reame di Napoli al cadere del secolo XVIII. e cominciare del XIX.* Napoli. He desires government interference whenever practicable, and wrote, in particular, a book on ancient and modern economical principles (*Analisi dell' economia privata e pubblica degli antichi, relativamente a quella dei moderni*,

Napoli, stamperia della soc. Filomatica, 1830) to point out that modern principles are preferable!

M. P.

CAIRNES, JOHN ELLIOT (1823-1875), was born at Castle-Bellingham, County Louth. His childhood was spent at Drogheda, whither his father, who was a large brewer, moved two years later. He was educated first at Kingstown and afterwards at Chester; and, as his teachers did not consider that his abilities fitted him for college life, he was, on leaving school, placed in his father's counting-house. Here he remained three years, developing a taste for study, and gradually finding business grow more and more irksome. Eventually his father made him a small allowance, upon which he lived at Trinity College, Dublin. He took the degree of B.A. in 1848, and that of M.A. in 1854. He subsequently studied law, and was called to the Irish bar in 1857, but he does not appear to have ever practised. During this period he also studied chemistry, engineering, and political economy, and engaged in journalistic work, his favourite topics being social and economic questions affecting Ireland. In 1856 he competed successfully for the WHATELY professorship of political economy in the university of Dublin, and from this time political economy became the study of his life. He held the professorship for five years, the full period during which it was tenable. It was a condition of the tenure that the professor should publish annually at least one lecture; and accordingly in 1857 he published the whole of his first course of lectures under the title of *The Character and Logical Method of Political Economy*. (A second edition appeared in 1875, shortly before the author's death.) In 1859, while still holding the Whately professorship, he was appointed by Mr. Cardwell, then Irish secretary, professor of political economy and jurisprudence at Queen's College, Galway. In 1859-60 he published in *Fraser's Magazine* and the *Edinburgh Review* three papers on the effects of the Australian and Californian gold discoveries. In 1862 appeared *The Slave Power*, a work that grew out of his last course of Dublin lectures. This book, which was dedicated to J. S. MILL, contained a philosophical analysis of the characteristics of slave labour, and of the social and economic effects of slavery, and was at the same time a defence of the cause of the Northern States in the American Civil War. It was an immediate success, and exerted a powerful influence upon English opinion. A second edition was called for in the following year.

From this time Prof. Cairnes enjoyed a high reputation as an economist. The period in question was one when political economy, and the Ricardo-Mill school in particular, was in the ascendant. In many departments of the science the doctrines taught by Mill were generally accepted as complete and final. It was to

this dominant school that Cairnes belonged, and amongst contemporary English economists he came to be ranked second only to Mill himself. In 1860 he married Eliza Charlotte Alexander, sister-in-law of his great friend Prof. Nesbitt. In 1865 he moved to the neighbourhood of London, and in the following year he was appointed professor of political economy at University College, London. He did not, however, resign the Galway professorship till 1870, it being allowed him to appoint a deputy to lecture in his place during the last three years of his tenure. He was, at the time of his moving to London, a confirmed invalid, subject to attacks of rheumatic gout of constantly increasing severity. Gradually he was reduced to a state of complete physical helplessness, and his sufferings were great. His intellectual vigour was, however, in no way impaired, and he retained to an extraordinary degree his accustomed energy and cheerfulness. He is spoken of by those who knew him as possessing great conversational gifts and admirable humour; and whilst himself cut off from active political life, he continued to take the strongest interest in current politics. He was an intimate friend of J. S. Mill, and also of Prof. FAWCETT and Mr. L. H. Courtney. Through them and others his political influence was considerable, especially on Irish questions. Prof. Fawcett has himself put on record the great reliance that he placed on Cairnes's political judgment, and the frequency with which they discussed current political questions together. Cairnes had always been a strong advocate of united education in Ireland (see his *Letter to J. S. Mill on "University Education in Ireland,"* 1866), and it is said on the best authority that he was the unseen centre of the operations that led to the defeat of Mr. Gladstone's Irish University Bill in 1873. The state of his health compelled him in 1872 to resign his post at University College, and on his retirement the honorary title of Emeritus Professor was conferred upon him. In the following year he received from the university of Dublin the honorary degree of LL.D. In 1873 he published a volume of *Political Essays*, about half of which is taken up with Irish questions, and also a volume of *Essays in Political Economy, Theoretical and Applied*. The latter volume contained the "Essays on the Gold Question" already referred to, and other essays that he had written for various periodicals in the course of the preceding fourteen years. In 1874 appeared *Some Leading Principles of Political Economy newly Expounded*, a work which is usually regarded as his most important contribution to economic literature. He died on 8th July 1875, after great suffering, borne, for many years, with extraordinary fortitude. He left a widow and three children.

After Mill's death in 1873, Cairnes occupied in general estimation the foremost place

amongst English economists, though it may be doubted whether his subsequent influence upon the development of the science has been as great as that of his contemporary JEVONS. His work in economics belongs to three departments of economic inquiry broadly distinguishable from one another, namely (1) the logic of political economy, (2) the investigation and interpretation of contemporary economic facts, (3) economic theory.

(1) The *Logical Method of Political Economy* is an admirably precise and clear exposition of the province and method of economics from the point of view of the Ricardo-Mill school, and it has long been regarded as the authoritative text-book of English political economy so far as its logic is concerned. Cairnes urges with great force that political economy is properly concerned with what is, not with what ought to be, and that its principles are therefore theorems of fact, not rules of conduct. It falls into line accordingly with theoretical sciences such as astronomy and physiology, not with practical arts such as the art of medicine or the art of legislation. The method of study appropriate to the science is held to be the DEDUCTIVE METHOD, and the ultimate premises of political economy are found to consist in a few simple facts of human nature taken in connection with certain physical properties of the soil and man's physiological constitution. The body of doctrine thus established is in itself abstract and hypothetical, since the forces taken into account are not the sole, although they are by far the most important, forces determining the phenomena of wealth. Hence in the application of economic laws a constant appeal to facts is necessary, in order to discover and allow for the effects of disturbing causes, that is, for the modifications that happen to be introduced in particular instances by the minor influences affecting economic phenomena. Cairnes's whole treatment of the subject is conservative in tone, and he has no sympathy either with those who, like Cliffe LESLIE, advocate the use of the historical method in political economy, or with those who, like Jevons, regard the science as essentially mathematical in character.

(2) The best examples of Cairnes's method of dealing with contemporary economic problems of a concrete kind are to be found in the economic chapters of the *Slave Power*, and in the *Essays on the Gold Question*. In both these cases he was fortunate in selecting topics of peculiar interest at the time when he wrote, and he discussed them with such originality, lucidity, and force, as necessarily to command attention. His treatment of the problems is, however, of more than merely temporary value; and in particular his conclusions in regard to the general economic characteristics of slave labour, and the conditions essential in order that such labour may be temporarily profitable, are exceptionally good instances of established econ-

omic doctrines, resting mainly on an INDUCTIVE basis. The *Essays on the Gold Question*, though open to criticism in certain respects, may, in regard to style, be taken as models of clear and well-arranged exposition. They deal with the effects of the Australian and Californian gold discoveries, and the most striking of them is perhaps that which treats of the "course of depreciation." Cairnes's theory is that whilst an increased supply of gold will raise the prices of different classes of commodities and services with unequal rapidity, there is in the apparent irregularity nothing capricious or abnormal. He holds, on the other hand, that the movement is governed throughout its course by economic laws, and that it is possible broadly to determine the order in which different kinds of things will be affected. The working out of this theory is exceedingly acute and suggestive; and the statistical verification that Cairnes offers of his theoretical anticipations may be taken as an example of his work as a statistician.

(3) The improvement of economic theory in general accordance with the doctrines of Mill and his predecessors is given as the main purpose of the *Leading Principles of Political Economy newly Expounded*. This work was not intended to constitute an exhaustive treatise on economic science. It may rather be regarded as a critical commentary on Mill's *Principles of Political Economy*. The chief topics discussed are SUPPLY AND DEMAND, the analysis of COST OF PRODUCTION, the WAGES-FUND theory, TRADES UNIONS, INTERNATIONAL TRADE and INTERNATIONAL VALUES. It is impossible in the space at our disposal to give even the briefest outline of Cairnes's views on the above questions. His method of treating them is nearly always ingenious and subtle. The wages fund theory, for instance, as resuscitated by him, is a far more complex and ingenious doctrine than that which Mill first formulated in his *Political Economy* and afterwards repudiated. Cairnes's theory is that wages are paid out of capital, and that, given the nature of the prevailing industries, the whole amount expended in wages necessarily bears a definite relation to a nation's total capital. In further working out the theory, he lays great stress upon the law of the tendency of profits to a minimum, and, in fact, assumes that profits are already at or within a hand's breadth of the minimum. Little note is taken of the distinction between profits and interest. The laws regulating wages are therefore made to depend ultimately on the laws regulating the accumulation of capital.

Cairnes is emphatic in his recognition of the existence of non-competing industrial groups. "No doubt," he says, "the various ranks and classes fade into each other by imperceptible gradations, and individuals from all classes are constantly passing up or dropping down; but

while this is so, it is nevertheless true that the average workman, from whatever rank he be taken, finds his power of competition limited for practical purposes to a certain range of occupations, so that, however high the rates of remuneration in those which lie beyond may rise, he is excluded from sharing them." This is in itself not much more than a restatement of a passage in Mill's chapter on the differences of wages in different employments. Much more prominence is, however, given to the doctrine by Cairnes, especially in its bearing on the theory of normal value; and it has hence come to be particularly associated with his name.

While the *Leading Principles* exercised a very stimulating influence upon economic discussion in England, the doctrines laid down in it cannot be said to have met with anything like general acceptance, even amongst those economists who belong, broadly speaking, to the same school as Cairnes himself. On the whole, the effect of the book was more destructive than constructive, for it helped to shake faith in the finality of the Ricardo-Mill doctrines. Cairnes tended to exaggerate the degree of divergence between Mill and himself, and the net result of his criticism was to impair Mill's authority to a much greater extent than he can himself have anticipated.

It has been said that as a controversialist Cairnes was deficient in intellectual sympathy, and the charge must be allowed. With the best intentions, he often fails to convey to his readers a fair idea of the real meaning of the doctrines he is combating. A striking instance of this is to be found in his treatment of Jevons's theory of the relation of value to utility. The theory in question is based entirely upon the distinction between total utility and final degree of utility, and yet, while criticising Jevons's views somewhat severely, Cairnes never once refers to this distinction. He confesses himself unversed in mathematics, and to this may perhaps be attributed both his misunderstanding of Jevons, and also a certain characteristic looseness of thought in several cases where quantitative notions are involved. He analyses cost of production, for instance, into effort and ABSTINENCE, which are in themselves incommensurable quantities, without ever seeming adequately to realise the necessity of reducing these incommensurables to terms of some common unit. True to the views expressed in his earliest work, he always showed great confidence in the validity of deductive reasoning in economics, and he was never afraid of pushing his theories to their logical conclusions. We have a remarkable instance of this in his working out of the wages fund theory, where he does not shrink from the paradox that an increase in the supply of labour will *ceteris paribus* diminish not merely the average rate of wages, but actually the whole amount expended in wages.

Cairnes will always be remembered as at once one of Mill's most distinguished disciples, and one of his most vigorous critics; and his works are likely to retain on their own account an important place in the history of economic literature. All that he wrote has a striking individuality, and he expounds his views with a literary skill and a persuasive force that it would be difficult to surpass.

CAISSE. French word for (1) a chest where money is kept; (2) the cashier's office or desk in a commercial or banking establishment; (3) the money in hand; (4) the cash book or the cash account; (5) an establishment where money is administered, e.g. *Caisse de dépôts*, *Caisse d'amortisation*. E. S.

CALL. This is an OPTION (*q.v.*) and an option is usually worth something. On the stock exchange there are dealers in puts and calls (see PUTS AND CALLS); a call meaning the privilege of calling for a specified amount of stock bonds or shares at an arranged price at a specified date in advance. Calls extend from one day to three months and even longer. Thus, the agreement may be that a buyer of a call, in January, gives to the seller 1 per cent on £10,000 Egyptian unified bonds for the privilege of calling for the delivery of these bonds at the end of February. The price usually taken is the actual quotation plus interest, or (to use the stock exchange phrase) continuation, rates which may accrue in the interval. We will say the specified stock is worth 80 in the middle of January, and to this price is added three fortnights' rates of continuation or interest at $\frac{1}{4}$ per cent per fortnight, so bringing up the call price to 80 $\frac{3}{4}$. If, in the meanwhile, the buyer of the call has been able to sell this amount of the stock at anything above 80 $\frac{3}{4}$, the difference represents his profit on the operation against which has to be set his first outlay of 1 per cent.

CALL is also used in connection with joint-stock companies and loans which are not fully paid up at the time of issue. For the convenience of subscribers it is usually arranged that the amounts paid shall be, on application, say 5 per cent of the amount, on allotment, 10 per cent, and the remainder is paid by degrees according to the dates of the "calls." Often, also, it is arranged that only part of the nominal capital shall be paid up, the remainder not to be called up without the sanction of the shareholders. In the case of the City of Glasgow Bank, in which the liability of shareholders and trustees of shareholders was "unlimited," the

calls continued until many contributors had paid up to the utmost farthing of what they possessed. Limited and reserved liability acts have put some limit to this terrible, because indefinite, risk.

A. E.

CALONNE, CHARLES ALEXANDRE DE, born at Douai 1734, died in Paris 1802. Originally a magistrate, he became, 9th November 1783, comptroller-general of the finances, which office he held till 8th April 1787, and in which he proved himself singularly incompetent. The commencement of his official career, however, at least in those points which were concerned with the chamber of discount, *la caisse d'escompte*, was successful enough; but before long the treasury, under his direction, became an institution only kept going by expedients. The fertility of his pen dazzled him; he considered difficulties as solved the solution of which was only deferred. Under his ministry the first assembly of Notables was convened. Having emigrated to England when the Revolution broke out, he returned to France in 1802, and died there a few months afterwards.

He successively published: *Correspondance de Necker et de Calonne* (1787, in 4to).—*Requête au Roi* (London, 1787, in 8vo).—*Réponse de Calonne à l'écrit de Necker* (London, 1788, in 4to).—*Lettres de Calonne au Roi*, 9 février et 3 avril, 1789.—*Note sur le mémoire remis par Necker au comité de subsistance* (London, 1789).—*De l'état de la France tel qu'il peut et tel qu'il doit être* (London, 1790).—*Observations sur les finances* (London, 1790, in 4to).—*Esquisse de l'état de la France* (1791, in 8vo).—*Tableau de l'Europe* (1795, in 8vo).—*Des finances publiques de la France* (London, 1797, in 8vo).

A. C. F.

CALVIN, JEAN (1509-1564). The name of this illustrious theologian rightly finds a place in an economic dictionary. His writings stand in the same relation to the Reformation as those of AQUINAS to the Middle Ages. The clearest and wisest thoughts of the Reformers on political, social, and economical questions are to be found in his works. He was qualified in no common measure to form just conclusions on these subjects. A profound lawyer, conversant with ancient and modern history, familiar with the state of society in different countries, engaged habitually in the discussion and settlement of questions of government, administration, law, and police, he combined theoretical with practical knowledge in an unusual degree. Added to these qualifications were a sagacity, a historical insight, and an expository and dialectical power rarely equalled.

Calvin's writings consist of his *Institutes*, the greatest theological product of the Reformation, his Commentaries on Scripture, his letters, and some polemical and theological tracts. These, coupled with information furnished by the records of Geneva, are the authorities for his views on economical questions. His opinions may be best discussed under the

following heads (1) church and state, (2) property and related questions, and (3) usury.

1. Calvin regards church and state as two separate and independent institutions. The state exists for man's temporal, the church for his eternal welfare. Each has its own officers and organisation. Neither should intrude into the sphere of the other: each should assist the other. All citizens are subject to both. The clergy are not exempt from the jurisdiction of the state. The church inflicts spiritual penalties only. Calvin was the first to distinguish the church from the state in such a way that both became independent powers, possessing an inherent jurisdiction. Up to his time the state had been subordinated to the church, or the church merged in the state. This view of the separateness and autonomy of the church and state has been of immense indirect effect on political economy. It has fostered the spirit of freedom: it has done justice to man's secular interests: it forms the foundation for the modern movement in favour of the separation of church and state. Such a separation was, however, far from Calvin's thoughts: on the contrary, he instituted the closest alliance between church and state. Magistrates perform sacred and legitimate functions. They must vindicate both tables of the law. Tyrannical magistrates are to be endured, but no obedience is due to commands at variance with God's will. Tributes and taxes are the legitimate income of princes: but their revenues are not so much private as public, the "blood of the people which it is inhuman not to spare." Alike in church and state the one supreme ruler is God (*Instit.* iv. 20).

2. Calvin saw clearly that the existence of PROPERTY was morally necessary. If there were no such thing as property there would be no test of justice and integrity (on Numb. xxxi. 28). The Libertines of his age advocated a community of goods, drawing their favourite argument from the practice of the primitive church recorded in Acts ii. 44; iv. 32. Calvin wrongly denies that such a community of goods ever existed. He contends that the community which prevailed had reference exclusively to the wants of the poor: that the surrender of their property was not made by all: that it did not embrace all their possessions, and that all did not receive equal shares. He is as opposed to the exaltation of voluntary poverty as he is to a community of goods. It is an ordinance of God that some should be richer than others. All men are not commanded to sell all. The rich young man of the Gospel was covetous and was bidden to sell all for his soul's sake. But the farmer sows who, forced by no necessity, sells the farm by which he supports his children (on Matt. xix. 16). Experience and observation had taught Calvin the importance of TRADE and COMMERCE,

and he was not slow to defend their lawfulness and value. He knew that POVERTY arose when trade fell off, and hence at a memorable conjuncture in the social history of Geneva he proposed to set up the weaving of cloth and velvet as a means of preventing poverty. His advice was taken, and for many years Geneva was famous for its manufactures of cloth and velvet. It has been too hastily inferred from this circumstance that Calvin was favourable to the "industrial ideal" of society. No passages can be quoted which prove that such was the case. It is unquestionable that he was ready to do all he could to augment the prosperity of Geneva, but his ideal was moral rather than industrial. LUXURY he condemned as sinful. He was a strenuous upholder of SUMPTUARY LAWS. (For particulars see *Stähelin*, i. 342.) But his legislation regarding the colour and shape of clothes, adornment, and so forth, was not conceived in an illiberal temper. He was equally opposed to those who would limit men's use of earthly goods to the bare necessities of life, as to those who would allow them to live as they pleased (*Instit.*, iii. 10). Calvin put down idleness and begging as immoral, but for those in real poverty he made admirable provision. To care for the poor was in his view the duty of the church. A special grade of officers had been formed for this purpose in apostolic times (on Acts vi.), and this grade he revived. He distinguishes between two classes of deacons: those who administer the affairs of the poor, and those who tend the sick poor, the former being specially deacons (*Instit.* iv. 3, 9; iv. 5, 15). His famous Ecclesiastical Ordinances provide for the yearly election of both classes of deacons. The first class took charge of the poor funds, the poor throughout the city, and the management of the hospital. The deacons tending the sick lived in the hospital (Kampschulte, p. 466). Ecclesiastical property he held it unlawful to alienate. What has once been devoted to Christ and the church is not the property of the magistrate. The magistrates should have the power of supervising and the deacons of administering this property (letter to Viret, 1542; on Acts iv. 32). It is clear that Calvin was as anxious as Knox himself to preserve ecclesiastical property for ecclesiastical uses, and that he did not wish the church to draw its revenues direct from the state. TITHES were public burdens and should be paid.

3. Calvin was the first theologian who rejected the current opinions regarding the sinfulness of USURY. His views on this subject are to be found in his commentaries on Ex. xxii. 25; Lev. xxv. 35; Deut. xxiii. 19; Ps. xv. 5; Ezek. xviii.; Luke vi. 35, and in the famous letter (Works, vol. viii. 223, ed. Amst.) Usury is not condemned by Scripture. Scripture forbids the exaction of usury from the poor,

but allows it in the case of the rich. The laws of the Jews which prohibited the taking of interest by Jews from Jews are political not moral laws: these very laws permitted Jews to receive interest from Gentiles. Usury is repeatedly condemned in the Old Testament, but never on grounds which are valid for all Christians. The prohibition of interest in the Old Testament is a provision in the interests of the poor. The exaction of interest from the poor has often produced tumults, as in Rome. Calvin rejects with proper scorn the substitution of "usura" for "the detested word fenus," holding that there is no description of "fenus" to which the name "usura" may not be given. He exposes the evasions by which usury was exacted without being mentioned by name, a poor man requiring to repay the loan of six measures of wheat by a return of seven. The question is one not of words but of things. ARISTOTLE's argument, accepted by Ambrose and Augustine, that usury is unnatural because money is barren, is worthless. May not a cheat make much profit by trading with another man's money? A man purchases a farm. Is not the produce convertible into money? Usury is not unlawful unless it contravenes equity. Usury therefore (1) must not be exacted from the needy; (2) the lender must not forget to be charitable; (3) regard must always be had to natural equity; (4) the borrower must be as much enriched by the transaction as the lender; (5) our conception of justice must be drawn from the Word of God and not from prevailing usage; (6) the interests of the state as well as the individuals concerned must be considered; and (7) the limit of interest fixed in each state must not be exceeded. But usury should not be made a means of livelihood. It is plain from this passage that Calvin rejected the two chief arguments against usury—its condemnation by Scripture, and the barrenness of money; but that he felt rather than saw the distinction between usury and INTEREST. Whether he discerned the principle on which the payment of interest rests is doubtful. He says, indeed, that no creditor can ever lend money without loss to himself, and that usury ought to be paid to the creditor in addition to the original sum to compensate him for loss, but it is uncertain whether he saw that this principle applies in all cases. (On Ex. xxii. 25 and related passages.)

The best edition of Calvin's writings is that under the charge of Baum, Cunitz, and Reuss, the publication of which began in 1863 and is still incomplete. The Amsterdam edition of 1667-71 in 9 vols. folio is that commonly quoted. The principal lives are by Henry, *Das Leben Calvin's*, Hamburg, 1835-44.—Stähelin, *Johannes Calvin Leben und ausgewählte Schriften*, Elberfeld, 1863.—Kampschulte, *Johann Calvin, Seine Kirche und Sein Staat in Genf*, Leipzig, 1869.—Dyer, *The Life of John Calvin*, London, 1850.—See

Ökonomie*, 1878, vol. xxxi. p. 163 et seq. Lecky, *Rationalism*, ii. 265, ed. 1878. w. p.

CAMBAGE, DROIT DE. This was a due payable in parts of mediæval Germany, France, and the Netherlands, by the tenants to their lord for the privilege of brewing ale. The term occurs in some chartularies during the first half of the 12th century, and about a hundred years later cambage with other dues was granted by Guy, count of Flanders, to the hospital of St. Bartholomew of Bethany. In England the seigniorial revenues from ale appear to have been almost, if not entirely, derived from AMERCEMENTS in the manor courts for breaches of the assize of ale, and the term "cambage" was not used. The word was no doubt derived from the low Latin, *camba*, an aleshop, and *camum*. The latter was a kind of effervescent ale brewed from barley with ginger and other spices.

[Ducange, *Glossarium mediæ et infimæ Latinitatis*, 1733.] A. B.

CAMBIST. See EXCHANGE BROKER.

CAMBON, PIERRE JOSEPH (1756-1826), the greatest financier of the period of the French Revolution, was a native of Montpellier, where his father carried on a large business as a wholesale grocer. He was well educated, and, as he showed a great aptitude for business, was admitted, while still young, a partner in his father's firm. He was highly esteemed by his fellow-citizens, was elected in 1790 a municipal councillor of Montpellier, and in 1791 a deputy for the department of the Hérault to the Legislative Assembly. He was already well known in Paris, where he had resided for several months during 1789 and 1790 as a *député suppléant* to the Constituent Assembly, and was immediately appointed reporter of the committee of the national treasury. In this capacity he showed such complete mastery of financial detail that he was in 1792 chosen by the financial committee of the Assembly to be their ordinary reporter. The declaration of war with Austria made it imperative for the Assembly to raise large sums of money at once, and Cambon in three elaborate reports laid the financial state of France before his colleagues. A careful study of these reports, which were entitled *Tableau des besoins et des ressources de la Nation*, presented on 3d April 1792; *Rapport sur la situation des Finances*, on 17th, 18th, and 19th April; and *Rapport sur la situation générale des Finances*, on 15th May, is absolutely necessary for any one who would appreciate the financial condition of France when foreign war added to the complications of the Revolution. The ability of

the reporter was generally recognised; Cambon was elected President of the Assembly in August 1792, and in the following month first deputy for the Hérault to the Convention. He was naturally elected to its financial committee, of which he became the ordinary reporter. The war with Austria had been followed by war with Prussia, and after the execution of Louis XVI. by war with Europe. The financial condition of France was desperate. All Cambon could do was to propose issues of ASSIGNATS, of which 400,000,000 of livres (£16,000,000) in nominal value were directed to be created 17th October 1792, and 800,000,000 (£32,000,000), 1st February 1793. Cambon was elected a member of the Committee of General Defence in January 1793, and of the first Committee of Public Safety in April 1793. This committee was replaced 14th July 1793 by what is known as the great Committee of Public Safety, to which Cambon was not elected. Thus freed from the cares and responsibilities of general administration, Cambon devoted himself wholly to the management of the finances of France. The two chief causes of the confusion which prevailed were the excessive amount of assignats in circulation and their consequent depreciation, and the ignorance prevailing as to the actual debt of the country. To remedy them Cambon proposed to prepare a GRAND LIVRE of the national debt. His aims are best indicated in the title of his report, presented to the Convention on 15th August 1793, *Rapport sur la dette publique, sur les moyens à employer pour l'enregistrer sur un grand livre; pour admettre la dette publique en paiement des biens nationaux qui sont en vente; pour retirer et annuler les anciens titres de créance; pour accélérer la liquidation; pour régler le mode actuel de paiement de la dette consolidée dans les chefs-lieux de district; et pour retirer les assignats de la circulation.* This is the great measure on which Cambon's fame as a financier rests. There is no need to examine his other reports; they all had the same intent, to realise the property of the nation and thus extinguish the assignats as far as possible. He was aided in his endeavours by other less known deputies, who worked in the Financial Committee, of whom the ablest were Ramel and Johannot, and by Robert Lindet, who had charge of the department of "national subsistences or resources" in the great Committee of Public Safety. Throughout the Reign of Terror, Cambon worked at the finances, and practically administered them. He had no sympathy with the views of Robespierre, and disliked the measure of the "maximum," which was forced on the Convention for political reasons, and was economically indefensible. This attitude made him most obnoxious to Robespierre, who attacked him by name in his last speech in the Convention on 8th Thermidor

year II. (26th July 1794), and would have proscribed him had not he himself been overthrown on 9th Thermidor. During the first months of the rule of the Thermidorians, Cambon maintained his position, but after the return of the proscribed Girondins, and the insurrections of Germinal and Prairial year III. (April, May 1795), he was attacked as a terrorist, because he had not opposed the Terror, and he was ordered to be arrested. He was, however, amnestied in the general amnesty of Brumaire year IV. (October 1795), and then retired from public life. In 1797, in a published *Lettre à ses concitoyens sur les Finances*, he promised to write a history of his administration of the finances with illustrative documents, but unfortunately he never fulfilled this promise. He returned to Montpellier a poorer man than when he became a deputy, and continued peacefully occupied in his business until 1815, when he gave in his adhesion to Napoleon on his return from Elba. This caused him to be exiled from France as a regicide in 1816, and he died at Brussels in 1826. Cambon was without doubt the greatest financier of the French Revolution; he shared MIRABEAU's abhorrence of national bankruptcy; he strove to draw his country from the financial embarrassment caused by the depreciation of the assignats; he managed the treasury skilfully and with absolute honesty, and he possessed MONTESQUIEU's power of making financial statements lucid and even interesting.

There exists no work devoted to Cambon and his measures; the best biographical sketch is in the *Biographie Rabbe* (1836); there are some interesting notices in *Montpellier sous la Révolution*, by Duval-Jouve, Montpellier, 1878; on his administration see *Les Finances de l'ancien Régime et de la Révolution*, by René Stourm. The following list of Cambon's most important financial speeches and reports is extracted from M. René Stourm's *Bibliographie des Finances au XVIII^{ème} Siècle*, published in the *Annales de l'École Libre des Sciences Politiques*, for 15th October 1890.—Legislative Assembly, *Rapport sur la situation de la Trésorerie nationale* (10th October 1791).—*Rapport sur les états de prévisions de dépenses pour 1792 et les comptes à présenter par les ministres* (11th November 1791).—*Opinion sur le rapport du Comité de la caisse de l'extraordinaire et sur la dette publique* (24th November 1791).—*Tableau des besoins et des ressources de la nation* (3d April 1792).—*Aperçu des recettes et des dépenses de 1792* (6th April 1792).—*Rapport sur la situation des finances à la date du 1^{er} Avril 1793* (17th, 18th, 19th April 1792).—*Rapport sur la situation générale des finances* (15th May 1792).—Convention, *Rapport et projet de décret sur une nouvelle création de 400,000,000 d'assignats* (17th October 1792).—*Rapport et projet de décret concernant la suppression de la caisse de l'extraordinaire et sa réunion à la Trésorerie générale* (24th December 1792).—*Projet de décret pour une nouvelle création d'assignats de*

800,000,000 (1st February 1793).—*Rapport sur la dette publique*, etc., quoted in text (15th August 1793).—*Projet de décret pour défendre la vente, cession, négociation, ou transport de titres actuels constatant les créances non viagères sur la nation* (11th September 1793).—*Rapport sur les domaines aliénés* (1st Frimaire year II., 21st November 1793).—*Projet de décret pour démonétiser les monnaies d'or et d'argent* (11th Frimaire year II., 1st December 1793).—*Projet de décret relatif aux assignats démonétisés* (24th Frimaire year II., 14th December 1793).—*Rapport sur le compte des recettes et des dépenses de la nation, depuis le 1^{er} Mai 1789 jusqu'au 1^{er} Septembre 1793* (3d Germinal year II., 23d March 1794).—*Rapport et projet de décret sur les mutations par décès des inscriptions au grand livre* (18th Fructidor year II., 4th September 1794).—*Rapport et projet de décret sur la liquidation des compagnies financières connues sous le nom de caisse d'escompte, assurances sur la vie, assurances contre les incendies* (25th Fructidor year II., 11th September 1794).—*Rapport sur les pensions dites ecclésiastiques* (2d Sansculottide year II., 18th September 1794).—*Discours au sujet du compte de l'argenterie des églises* (12th Brumaire year III., 2d November 1794).—*Rapport et projet de décret sur les taxes révolutionnaires* (6th Frimaire year III., 26th November 1794).—*Rapport sur les moyens à prendre pour retirer les assignats de la circulation et sur la création d'une loterie* (3d Pluviôse year III., 22d January 1795).—*Résumé des diverses opinions présentées à la Convention Nationale sur le projet du Comité des Finances pour accélérer le retraitement des assignats* (7th Ventôse year III., 25th February 1795).—*Rapport sur la fixation de la contribution foncière à imposer sur les inscriptions consolidées et viagères* (16th Ventôse year III., 6th March 1795). (See ASSIGNATS; MAXIMUM.) H. M. S.

CAMBRELENG, CHURCHILL C., born in North Carolina 1786; died in Long Island 1862. He was engaged in business in New York; and became member of congress 1821-39. An ardent free trader, he published anonymously, in 1821, *An Examination of the New Tariff proposed by the Hon. Henry Baldwin, a Representative in Congress*, by one of the People, New York, pp. 268. In 1830, as chairman of committee on commerce, he made a *Report on Commerce and Navigation*, which was extensively circulated even in England; in this he strongly condemns the commercial policy of the preceding fifteen years; in 1838, from the Committee on Ways and Means, he made a *Report on the Currency, National Bank, Independent Treasury*, in which he argued the separation of the banking and fiscal operations of the government. D. R. D.

CAMERALISTIC SCIENCE (*Kameralwissenschaft*). So called because in the progress of time the private chamber of the king became the treasury, and the *camerarius* assumed a new and fiscal importance. Strictly speaking, the science treats of the adaptation of means to ends, and the effects of expenditure on the fund of wealth from which revenue can be drawn. Thus

it is nearly equivalent to "Science of Finance." There can be no doubt that in the 18th century the term was applied to a subject which might have been perfectly described by the latter phrase. There are, however, two reasons for treating them as separate and distinct. While writers on FINANCE (*q.v.*) generally treat of the national revenue and expenditure from an isolated point of view, the cameralistic writers considered the financial as but a part of entire economic science. Thus we are entitled to speak of cameralistic as well as of financial science. In the second place *finance* is frequently used as almost if not quite synonymous with taxation. The distinctions thus drawn are not, however, unexceptionable. Many treatises on cameralistic science are in point of fact treatises on the art of taxation, while on the other hand such a work as RICARDO'S *Principles of Political Economy and Taxation*, despite its incomplete nature, belongs in great part to the department of cameralistic science. (Another branch of this subject may be studied under COMMERCIAL SCIENCE, *q.v.*)

[Good examples of treatises on *Kameralwissenschaft* in its early sense as related to other branches of *Volks-wirtschaft* or more generally, *Wirtschaftliches Wissen* are furnished in Baumstark (Edward), *Kameral, etc.*, *Encyclopädie*, and Rau (C. D.), *Ueber die Kameralwissenschaft*; while for its more matured form the works of Rau, Wagner, and Leroy Beaulieu should be studied.] E. C. K. G.

CAMERARIUS, JOACHIM (born 1500, died 1574), an eminent scholar and "humanist," the friend of MELANCHTHON, the "glory of the German name" according to the learned Casaubon, deserves notice here as the author of a history of Greek and Roman money; and as having combated the mediæval prejudice against the payment of interest (see AQUINAS). "Why," he asks, "should you not pay for the use of money as well as for the use of a house?"

Historia rei Nummarie sive De Numismatis Græcis et Latinis, in the ninth volume of Gronovius's *Thesaurus Græcarum Antiquitatum*. Another work on an economic subject was *Politicorum et Economicorum Aristotelis interpretationes et explicationes*, 1581. F. Y. E.

CAMPANELLA, TOMMASO (1568-1639), (a Dominican, born in Calabria), a much persecuted philosopher, wrote among many other works, *Civitas Solis*, an "idea of a philosophical republic," resembling the Platonic republic in the community of wives and goods, and in many other features, but not in slavery. In the city of the Sun "no one thinks it lowering to wait at table or to work in the kitchen or fields. While duty and work are distributed among all, each one has only to work about four hours a day." The remaining hours are spent in pleasant mental and bodily exercises. Commerce plays a small part in the simple economics of the Solarians. Money, given in exchange for foreign goods is not received.

[*Civitas Solis*, begun in 1602 (during the

author's imprisonment), was published as part of *Realis Philosophiæ Epilogisticae partes quatuor*, Frankfurt, 1623.—*Fra Tommaso Campanella* . . . Luigi Amabile, 1887.—*Thomas Campanella* . . . Ernest Nys, 1889. Abstract in Jowett's *Republic*, Preface. An English translation in Morley's *Universal Library*, Routledge.] F. Y. E.

CAMPOMANES, PEDRO RODRIGUEZ, Count of (1723-1802), an eminent Spanish jurist, economist, and statesman. As a member of the group of enlightened ministers who gave lustre to the reign of Charles III., he laboured for the reform of taxation, the promotion of agriculture and manufactures, the diffusion of education, and the adaptation of Spanish institutions to the needs of the age. Eminently upright and disinterested, he was one of the foremost benefactors of his country. His theoretic views and practical efforts strikingly resemble those of his illustrious contemporary Turgot.

The principal economic writings of Campomanes are:—*Respuesta fiscal sobre abolir la tasa y establecer el comercio de granos*, 1764.—*Discurso sobre el fomento de industria popular*, 1774, and *Discurso sobre la educacion de los artesanos y su fomento*, 1775. Robertson eulogises the two latter works in his *History of America* (note 193), and justly says of Campomanes—"There are not many authors who have united more happily the calm researches of philosophy with the ardent zeal of a public-spirited citizen." J. K. I.

CANALS may be defined as artificial waterways constructed for the purpose of navigation or irrigation. Navigable canals may be divided into two classes: (1) those used for inland navigation, and (2) those used to shorten sea voyages. The former have been constructed to carry boats and barges limited on the smaller canals to a carrying capacity of 25 to 30 tons, and on the larger canals to a capacity of from 50 to 300 tons. In the Amsterdam and Manchester ship canals, a successful attempt has been and is being made to construct a waterway of sufficient size to permit of the passage of large sea-going vessels. The chief examples of the second class are the Suez Canal, the Languedoc Canal, and the Caledonian Canal. Though known in Egypt and China, and constructed in Holland in the 12th century, it was not until the invention of locks in Italy in the 14th century that inland navigation made any progress in Europe. The development of canals in Holland greatly extended that country's commerce, as by their means a large inland trade was carried on with Germany and France. Several important canals are found in France towards the end of the 17th century, but in England the first modern canal was not authorised until 1755. Five years later the Duke of Bridgewater obtained his first Canal Act, and the success attending the construction of the canal from Worsley to Manchester gave such an impulse to such undertakings that PORTER (*Progress of the Nation*, § iii. ch. i., 1836-1843)

pointed out that, owing to the construction of canals, there was no spot south of the county of Durham at a greater distance than fifteen miles from water conveyance. It was expected that canals would prove formidable rivals to railways, but in 1845 began the gradual transfer of canals to railway companies. This transfer was in some cases due to the dread that railways would secure all the traffic, and the withdrawal of opposition to the construction of the railway was secured by the purchase of the canal. In other cases the railways offered tempting terms so as to secure a monopoly of traffic. The result was that nearly one-half the inland navigable canals are controlled by railway companies (see *Evidence taken before select committee on canals*, 1883). Some canals have been closed or allowed to fall out of repair, on others heavy tolls called "bar tolls" have been imposed to prevent their use by traffic from neighbouring canals, whilst no adequate attempt has been made to establish through communication or speedy service (see *Report of committee on railways*, 1882). In 1872 a joint committee of the House of Lords and of the House of Commons recommended that no internal navigation in the hands of the public should be placed under a railway company, and in 1882 a select committee of the House of Commons on railways expressed the opinion that it was "impolitic that railway companies should have the control either directly or indirectly of canal navigation, and that where canals are already under the control of railway companies, parliament should endeavour to ensure their use to the fullest possible extent."

The advantages of canals over railways have been summed up by L. F. Harcourt in his treatise on *Rivers and Canals* (Oxford, 1882), as follows—"They are frequently less costly in construction, and their cost of maintenance and their working expenses are considerably smaller. Moreover, the proportion of dead weight to the load carried is much less in canal barges than in railway waggons; and the barges not only cost much less proportionately to their capacity than waggons, but are also far more easily repaired. The resistance also to traction is much smaller in water than on rails, amounting, according to M. Malézieux, to only one-fifth of the average resistance on railways. Barges on canals can be loaded or unloaded at any places they pass; whilst goods trains can only stop at stations." See also the *Evidence given before the Committees on the Manchester ship canal*, 1883, 1884, 1885, and *Canals* by M. Stevens (London, 1887).

[On the economic aspects of canals reference may be made to *Observations sur les tarifs de nos canaux*, F. Aulagnier, 1837.—*Observations on Canals and Navigable Rivers*, G. Beadon, 1848.—*Le Canal Indo-Européen et la navigation de l'Euphrate et du Tigre*, E. Ende, 1886.—*Kanäle und Eisenbahnen*

CANARD, NICHOLAS FRANCOIS, professor of mathematics at the Collège de Moulins (b. about 1750, d. 1833). He was the author of *Principes d'Économie Politique*, Paris, 1802, crowned by the French Academy. "Ces prétendus principes," says COURNOT, "sont si radicalement faux, et l'application en est tellement erronée, que le suffrage d'un corps éminent n'a pu préserver l'ouvrage de l'oubli."

Canard also wrote *Mémoires sur les causes qui produisent la stagnation et le décroissement du commerce en France, et qui tendent à anéantir l'industrie commerciale; moyen simple de les faire cesser*, Paris, 1826.

[Canard is criticised by M. Bertrand, *Journal des Savants*, 1883, p. 499.] F. Y. E.

CANCEL, CANCELLATION. The discharge of a document, usually by marking across the operative signature, or signatures, either the word "cancelled" or some recognised mark. "The cancellation of a signature operates as a

discharge, unless proof can be given that the cancellation was done by mistake."

[Hutchison, *The Practice of Banking*, vol. i. p. 125.]

CANCRIN, GEORGE (1774-1845), an eminent Russian financier, son of Franz Ludwig Cancrin, the distinguished German mineralogist. Born at Hanau in Electoral Hesse, he studied law and political economy at the universities of Giessen and Marburg, and early showed a remarkable faculty for work and a spirit of restless activity. He filled successively several posts in the administration of Anhalt-Bernburg. He joined his father in Russia, 1796. In 1800 he was employed in the ministry of the interior, and, having attracted attention by writings on military economy, he was made, 1812, intendant-general of the army of the West, and in that capacity accompanied the Russian forces in their march through Germany. In 1813 he was appointed intendant-general of all the "active" armies. This office he resigned in 1820, and in 1823 became minister of finance, a position which he held till 1844. He possessed in a high degree the esteem and confidence of the Emperor Alexander, as well as of his successor. He was most diligent and energetic in discharging his ministerial duties, founded many useful establishments, and gave a great impulse to the national industries. He had special agents at Paris, at London, and in Germany, who kept him informed on the progress of the arts and the introduction of new processes. By his financial management he increased the revenue, and raised the credit of the empire, previously on the verge of bankruptcy. But his system, though successful in providing resources for the government, was founded on rigid prohibition and state-manufactures, and appears to have been burdensome to the community. His term of office, we are told, is now regarded by the Russian people as the most unfortunate period of their history. He died at St. Petersburg in 1845. ROSCHER thinks his general economics were injured by his pre-occupation with the question of military supply, immediate results being aimed at in the latter case, whilst in the conduct of national affairs as a whole permanent prosperity is the object to be achieved. He represented a reaction against Adam SMITH from the point of view of a man of the world who had to conduct the economic practice of a country much less advanced than England, in fact, as he himself calls it, "infra-European." Strictly conservative in his economics, he disliked new institutions, being thus sometimes led to paradoxical conclusions; he opposed, e.g. the establishment of banks and the extension of railways, at least in Russia. (Roscher, *Geschichte der Nat. Oek. in Deutschland*, p. 813.)

Cancrin was author, besides minor publications, of a treatise *Ueber die Militärökonomie im Frieden*

und im Kriege, und über ihr Wechselverhältniss zu den Operationen, 1820-23, of *Weltreichthum, National-Reichthum und Staatswirthschaft, oder Versuch neuer Ansichten der politischen Oekonomie* (published anonymously), 1821, and *Die Oekonomie der menschlichen Gesellschaften und des Finanzwesens, von einem ehemaligen Finanzminister*, 1845.

CANDAREEN. A denomination of the Chinese money of account, but not a coin. 10 cash=1 candareen (see CASH). 10 candareens=1 mace. 10 mace=1 tael (the unit of value).

F. E. A.

CANNING, GEORGE, born in Marylebone, 1770, died at Chiswick, 1827, is most famous for the unique services which he rendered as foreign secretary, especially in the autumn of 1807, when he directed the capture of the Danish fleet, and in 1822 and 1826, when he stood firm against France and the Holy Alliance in the affairs of Spain and Portugal. His "Needy Knife Grinder" and other witty papers in the *Anti-Jacobin* have given him a place of his own in our minor literature. In economical history his place is subordinate. His first views of commercial policy inclined him to compromise. Though he was not a profound student of finance and political economy, his close alliance with HUSKISSON counteracted his own shortcomings, and justifies his inclusion among the pioneers of a free-trade policy. His utterances on the bullion controversy, the CORN LAWS, and the navigation acts, had a distinct influence on the public as well as on the House of Commons.

When the Report of the Bullion Committee came up for discussion, May 1811, Canning as a private member gave (in two speeches—8th May and 13th May) a general support to the resolutions of the committee, though he refused to vote for the sixteenth (or last) which pledged the bank to resume cash payments in two years' time. VANSITTART and PERCEVAL had urged that continued suspension of cash payments was necessary to the successful prosecution of the war with France. Canning answered that our best strength was to support the credit of the country, and the soundness of the currency. There must be no uncertainty in the public mind as to the real standard of the currency. The question of depreciation was a question not of the soundness of the bank itself but of the relation of the notes of the bank to the real standard, which Canning defined (as PEELE afterwards defined it) as a definite measurable quantity of the metal gold, of a certain ascertainable fineness. Vansittart had talked of the standard as being a "sense of value," or as "public estimation"; and Canning had no difficulty in showing the vagueness of these phrases, and, contrariwise, the clearness of the terms employed by the bullion committee, who had been slighted as "abstract theorists," only because in addition to practical knowledge they

had acquaintance with first principles. They were right in finding a sufficient proof of depreciation in the fact that there was a difference between the price of BULLION in bank notes, and the MINT PRICE of gold; and it was an important confirmation, to find the exchanges continuing for some time progressively unfavourable to this country. It seemed to Canning (as to CORBET) that BURKE's description (1791) of the contrast between English notes and French ASSIGNATS can fairly be applied to the contrast between English notes as they were in Burke's time, and English notes as they were in 1811. The resolutions, introduced by Vansittart, though not of Vansittart's own invention (see Canning's Speech on Bank Charter Act, 13th Feb. 1826), in opposition to those of the bullion committee, called forth all the resources of Canning's wit and sarcasm, especially the famous third resolution that the bank notes "have hitherto been and are at this time held in public estimation to be equivalent to the legal coin of the realm." He compares this to Bonaparte's proclamation that beet and maple sugar are infinitely better than cane sugar, and must, therefore, be used in place thereof, under penalties. These two speeches of 1811 are striking examples of Canning's power to master at second hand the principles of a subject to which he does not appear either then or afterwards to have given any special study. In the *Quarterly Review* (Nov. 1810 and Feb. 1811, dealing with two pamphlets of Sir John SINCLAIR) he treats the same subject (of the bullion committee) in his lighter vein (see BULLION COMMITTEE, REPORT OF; CURRENCY THEORY, etc.) He had to deal with a kindred topic (in his speech of 13th Feb. 1826) when the government were taking steps to stop the circulation in England of bank notes under five pounds; but except perhaps for a telling quotation from a private letter of Burke's ("If Pitt consents to the issue of one pound notes he will never see a guinea again") the speech is not of special importance.

In office along with Huskisson in 1823 and 1826, he gave willing and admiring support to the reforms in commercial policy introduced by his colleague. It was in the negotiations for a reciprocity treaty with Holland, in amendment of the navigation acts, that he sent (in 1826) in answer to Falck, the Dutch minister at the Hague, the well-known despatch in cipher:

"In matters of commerce the fault of the Dutch
Is giving too little and asking too much;
With equal advantage the French are content,
So we'll clap on Dutch bottoms just twenty per cent.

(Chorus.) Twenty per cent. Twenty per cent.
Nous frapperons Falck with twenty per cent."

In 1827 he helped Huskisson to frame a

sliding scale of duties, in amendment of the corn laws of 1815 and 1822 (see CORN LAWS and SLIDING SCALE). His policy here, as well as in the case of West Indian slavery (see speeches of 1823, 1824, and 1826), was that of compromise and gradual reform. He admitted in 1827 (speech of 1st March) that the paternal power he had claimed, in 1826, for government, to relax the corn laws and open the ports on emergency, had not proved to work well in practice, and the confession was one sign amongst many that he was inclining towards a policy opposed to all interference of government with trade. His single budget speech, 1st June 1827 (when he was at once prime minister and chancellor of the exchequer), cannot fairly be taken as a measure of his financial ability, for the circumstances were exceptional, and the budget a makeshift. His conception of the relation of economics to politics may be gathered from his short speech in defence of Huskisson against the silk manufacturers (24th Feb. 1826): "We must deal with the affairs of men on abstract principles, modified, however, of course, according to time and circumstances;" we must soar to "the heights from which alone extended views of human nature can be taken." He was careful to point out that reform of commercial policy had been hitherto identified with neither political party; it was his master, PITT, who carried the treaty of commerce with France in 1786, when Fox opposed it.

J.B.

CANON LAW. The canon law is a body of rules (*kanônes*) laid down by the early and mediæval Christian church for the government of its members. It consists accordingly of citations from scripture, the fathers, and the popes, together with commentaries and glosses. The several compilations of this character, beginning at the end of the 3d century and carried down to his own day, were reduced to something like their present systematic shape (in the "*corpus juris canonici*") in the middle of the 12th century by Gratian, a monk of Bologna, the founder of the study of canon law. His successors appended to his collection (or "*Decretum*") the decretals of the popes in the next three centuries. It need hardly be said that only such of its topics as bear on economical theory or history will be considered here.

At the beginning of the book we are told that the human race is under two kinds of laws,—the law of nature and the law of custom (or positive institution) "*naturali jure et moribus.*" Civil law and canon law are two

branches of the second species. By the law of nature there is no private property, but "all things are common to all men" ("jura naturali omnia sunt communia omnibus"), as they were among the first disciples. St. Augustine argues that, as "the earth is the Lord's and the fulness thereof," private property is not of divine but of purely human appointment. "Tolle jura imperatorum," and no one can say "this is my house," or "this is my slave," etc. It would seem natural after this to hear that private property is forbidden by canon law; but this is not so. It is forbidden to the clergy, who are to hold their property collectively for the good of the poor; they are not to marry; and they are to be "victu et vestitu contenti." But it is allowed, grudgingly, to the laity, who are to hold it in trust for the poor, and who are therefore to give liberally to the poor and to the clergy as the almoners of the poor. It is hinted that among Christians the ideal distribution is community of goods, and that only for the hardness of men's hearts is any compromise admitted. In the same way the ideal industry is agriculture; and the only right way of increasing wealth is to till the ground and breed cattle. These pursuits and the simple manufacturing industries of an agricultural people are allowed with reservations even to the clergy, who may thus work for their own livelihood, like the apostles. Labour within these limits is indeed commended by the canon law; and it is one of the glories of the early and mediæval church that it did its best to enfranchise the labourer. ROMAN LAW had more regard for property than for human beings; canon law erred on the safer side. In their aspirations after an idyllic life it is clear that the writers would have gone back to barter if they dared. As it was they followed ARISTOTLE in treating money as a "barren metal," and they gave literal effect to the words of the gospel: "Lend, hoping for nothing again" ("Mutuum date nihil inde sperantes"), by strictly forbidding usury and by giving every assistance to the debtor as presumably poorer than the creditor. At first (by the council of Niceæ, 325 A.D.) the prohibition of USURY applied only to the clergy; but a century later it was extended to the laity, and the "corpus juris canonici" abounds in emphatic assertions of it. "Etiam laicis usura damnabilis." "Usura" did not simply mean a high rate of INTEREST; it meant all and every interest whatever, and the notion was even stretched so as to embrace all and every gain beyond what was considered a just and proper price, in ordinary buying and selling. "Qui plus quam dederit accipit, usuras expetit," whether the "superabundantia" be money or wheat or wine. "Quidquid sorti accedit, usura est." "Turpe lucrum sequitur qui minus emit ut plus vendat." "Rapinam facit qui usuram accipit." As late as the 14th century (at the

Council of Vienne, 1311) Clement V. declared the prohibition of usury to be absolute, all civil laws to the contrary notwithstanding. Dante puts the usurers in the lowest division of his seventh circle of Hell as doing violence to God and nature (*Inferno* XI., 46-50, cp. 95-111). THOMAS AQUINAS (in 13th century) speaks of usury as "contra legem naturæ," as well as against the law of the church; and this unnaturalness had been one of the grounds of prohibition from the first. Usury might be practised only as a form of war, "Ubi jus belli, ibi etiam jus usuræ."

"If thou wilt lend this money, lend it not
As to thy friends,—for when did friendship take
A breed for barren metal of his friend?—
But lend it rather to thine enemy."

The arguments by which the unnaturalness of interest was maintained ran somewhat as follows: When money is lent, the lender parts with it, and the borrower has it to use; if there were any productiveness in it, the man who has used it, and not the man who has parted with it, would justly have the benefit. There is, however, no productiveness in it. The lender gives, say, ten pieces of silver; now these ten pieces are not like seeds in the earth, or trees in the orchard; they do not become anything else than ten pieces of silver, through however many hands they pass. Why then should they become eleven or twelve when delivered again to the lender?

Again, it was said, we must distinguish two kinds of loans. There are objects which, when we have borrowed (or hired), we use without destroying them in the use—e.g. a field, or a horse, or a spade. We return them not "in genere," but specifically, in their identity, with compensation to the lender for any deterioration we may have caused. This loan is the *COMMODATUM* of Roman law, as distinguished from *MUTUUM*. In the latter instance ("mutuum"), as in the case of fruit or wine, the borrowed objects are destroyed in the using, and are returned to the lender in kind. Now, money is of the latter sort; it has no "use" which is distinct from itself, and consistent with its retention by the possessor; to use it, he must part with it. But, if we allow usury, we are claiming that money has a use distinct from itself, and that, when the sum borrowed is returned, an additional sum should be added in payment of this supposed use,—in other words "id venditur quod non est." Of the other arguments used against usury by the canonists, it will be enough to cite perhaps the most famous one. To pay interest is to pay for time. Now time is the common property of all men; and, besides, time is like barren metal itself; it can of itself produce nothing; why then should anything be paid for it? Thomas Aquinas laid special stress on this argument, which he was

the first distinctly to formulate. It does not appear very explicitly in the canon law itself.

The motive for the prohibition is clearer than the arguments advanced for it. It is the same motive which led the church to forbid a man in any case to take advantage of his neighbour's need, and wring from him an exceptionally high price. Christian brotherliness required that my neighbour's extremity should never be my opportunity, and I should never charge him more than the fair price *JUSTUM PRETIUM* for my goods, the said price being the one assessed in money by the church or (it might be) by the civil authorities, and ratified as customary. The same principle would prevent me from exacting any recompense for a loan. Otherwise, in either case, I should be receiving what I had not earned by the sweat of my brow, and violating the law of God and nature.

The European world, with settled order and increasing commerce, chafed under this enforced unselfishness; and the church was forced to tolerate evasions of the prohibition of usury. These evasions will be more fully treated under the head of usury; but the chief instances may be mentioned here. The buyer on credit was allowed to pay more (in the final settlement) for his article than the buyer for cash, in all cases where, in the first instance, there had been a real uncertainty from ordinary causes about the future price of the article concerned. But it was to be clearly understood that the difference in time was to have nothing to do with the difference in the price (decretal of Alexander III. in 12th century, confirmed by Gregory IX. in 13th century).

This was a comparatively early concession made to the Genoese when Italian commerce was beginning to grow, after the first crusades. It was followed by others. It was found possible, for example, to exclude the *BILL OF EXCHANGE* from the category of usury by representing any *DISCOUNT* or *INTEREST* it involved as a payment for work done, namely, the work of transporting money (or at least the payment of money) from one place to another. Though money by itself was (to the canon law) unproductive, "money conjoined with human labour" ("*pecunia juncta cum hominis operatione*") could be productive. Accordingly, when companies were formed some of whose members contributed money and labour, others only their money, yet all shared in the gains, it was allowed (not without misgivings) that this conformity to the letter of the law was sufficient.

A third kind of exception was made in cases where loans were attended with unusual risks to repayment; the lenders were allowed to receive a sum over and above their principal as a compensation for the risk they had run. This concession was very grudgingly made; but (as Hallam has noticed) marine *INSURANCE* seems

from the first to have passed unchallenged. Not unlike these cases was that of creditors whose debtors were behind their time; interest in such a case was counted a justifiable penalty for breach of contract ("*usura punitoria*").

Finally, the Jews were allowed to lend money at interest, because, not being Christians, they were not bound by canon law. There were always some canonists who (like Aquinas) objected to this toleration; but its practical convenience saved it; and, till the *LOMBARD* money-lenders became their competitors, the Jews had the monopoly of nearly all the credit transactions that could not be brought within the letter of the canon law. Communities of lax Christians, like the traders of Genoa and Cahors, seemed to have imperilled their orthodoxy to gain similar advantages.

The church itself, especially in the later centuries, found reason to relax its prohibition of usury where its own material interests were seriously involved. The sale of offices, for example, such as those of chamberlain and treasurer in the papal court, realised a higher price when purchasers were allowed to club together to bid for them; the result was, however, that many of those joint purchasers, who had no intention of holding the offices themselves, shared in the revenues in a way indistinguishable from the receiving of interest on capital invested. Again, the sale of land for a fixed yearly ground rent ("*census consignatorius*"), instead of a sum paid down once for all, was conceded, on the subterfuge that, not the yearly income, but the right to the yearly income was the subject matter of the sale. Pius V. (in the 16th century) decided that such arrangements were not unlawful, provided that they related to land only, and were strictly determined by the actual yearly produce of it. Had he decided otherwise, the revenues of large numbers of religious houses, especially in Germany, would have been seriously affected.

But in the toleration of the "*montes pietatis*" (which date from the 15th century), both the letter and the spirit of the older canon law were violated. These institutions were formed by the joint subscriptions and donations of philanthropic Christians; and they were simply banks which advanced money to the poor at interest. This interest was represented as simply a "recompense" for the trouble of managing the institutions that advanced the money, and thus the obnoxious name of usury was avoided, though the fact was certainly present. Besides, the "*montes*," to attract subscriptions, gave interest on the sums subscribed, and thus became simply an investment for capital. There were also "*montes profani*," secular banks, founded on their model, but without their charitable object, and dealing with ordinary men of business. But even the "*montes pro-*

fani" escaped condemnation; it was held that they were of service, if not to the poor, at least to the public, and the interest they gave on investments represented a LUCRUM CESSANS, or loss which the investors were presumed to have incurred by withdrawing their money from trade and putting it into these banks. When "usury" had been tolerated in the case of these societies, it could not be long before the like concession would be made in the case of individuals (see articles FATHERS; MONTS DE PIÉTÉ.)

CANTALUPO, DOMENICO, a Neapolitan, author of a very successful essay on the corn trade, published in 1783 at Palermo. The third edition was published in Nice and Genoa in 1795, and the fourth edition by CUSTODI in his *Economisti classici Italiani*. Cantalupo strenuously recommends free trade, full, sure, and equal liberty for all, and traces the history of corn laws from the times of King Ladislaus (1400) down to his own times to prove the bad effects which a restrictive system always produced.

M. P.

CANTILLON, PHILIP, author of "*The Analysis of Trade, Commerce, Coin, Bullion, Banks, and Foreign Exchanges* . . . Taken chiefly from a Manuscript of a very ingenious Gentleman deceased, and adapted to the present situation of our Trade and Commerce. By Philip Cantillon, late of the City of London, Merchant, London, 1759." 215 pp. 8vo. This Philip was the eldest son of James Cantillon of the city of Limerick, who was first cousin

of Richard CANTILLON, author of the *Essai sur la Nature du Commerce*. Philip carried on a banking business with David Cantillon at Warford Court, Throgmorton Street, London, at least as early as 1725. In 1738 he was a director of the Royal Exchange Assurance; in 1742 became bankrupt: in 1747 was trading alone as insurance agent and policy broker: in 1753 was partner with one Thomas Mannoek in the same business: and in 1759 had retired. He married, 14th July 1733, Rebecca, daughter of William Newland of Gatton, Surrey, by whom he had two daughters. There is reason to think that he was engaged for a short time at Richard Cantillon's bank in Paris, but that his litigious character made him unamiable and brought about his speedy return. On the death of Richard, Philip intervened in the management of his estate, and thus obtained possession of several papers, including probably the English manuscript of the *Essay*, which professedly served as the groundwork of the *Analysis of Trade*. He must, however, have mutilated the manuscript almost beyond recognition. Much of the closely packed original is omitted, and much is replaced by vague and general summaries, most unskillfully made, with the result that little indeed of the *Analysis* fairly represents the views of Richard Cantillon. Philip added a preface on the history and importance of commerce, some strictures upon close corporations, new matter on inland and foreign trade, bankers and banks, and exchanges, interspersed with quotations from HUME's *Essays*, and from *The Universal Merchant*, etc. (see N. MAGENS), concluding with a criticism of the law relating to bills of exchange.

The book was reviewed in the *Monthly Review* or *Literary Journal* for April 1759, London, vol. xx. 309. Sir James STEUART (Works, ed. 1805, iii. 22) says, "Mr. Cantillon, in his *Analysis of Trade*, which I suppose he understood by practice as well as by theory, has the following passage," etc.

"A small treatise of Arithmetic," explaining the foreign exchanges "vulgarly and decimally" without "unintelligible jargon," was designed by the author of the *Analysis* (p. 85), but does not seem to have ever been published. H. H.

CANTILLON, RICHARD. The economic repute of Cantillon, for a time completely obscured by the glory of Adam SMITH, can never have rested upon the popularity of his little book, now one of the rarest works in economic literature. For GOURNAY had to exercise his great personal influence to persuade his disciples not to neglect it as others were doing. And the elder MIRABEAU, himself an adept in the craft of popular writing, deplores, and accounts for, the failure of the book as due to the defects of its style and the aridity of its subject. The perverted *Analysis of Trade* (see PHILIP CANTILLON), sometimes confused with it, probably conduced to its disrepute. On the other hand it was thought worth while

to reprint it at least twice within a year of its publication. And the references to it in so widely-read a book as *L'Ami des Hommes* must have made known the name of Cantillon to many who never saw his *Essai*.

The influence of the book is evidenced not by the number but by the distinction of its students, including Gournay, QUESNAY, Mirabeau, Turgot, and Adam Smith. It gave birth to Mirabeau's *L'Ami des Hommes* and apparently suggested much of the *Tableau Oeconomique* of Quesnay and parts of the *Wealth of Nations*. It was, however—perhaps because of its concise style—much misrepresented and misunderstood. Cantillon avoided, as JEVONS has pointed out, the one-sidedness of the PHYSIOCRATS; and yet has been marked out as a Physiocrat. He was declared by Mirabeau to hold the doctrine that population is the source of riches, though, in Jevons's opinion again, he anticipated in condensed form the celebrated essay of MALTHUS. And Adam Smith loftily imputed to him an attempt to form exact estimates in matters where Cantillon expressly disclaimed any such pretension.

The importance of the book in the history of the development of economic science may be best indicated by a short analysis of its contents. It consists of three parts. Part I. opens by defining WEALTH and resolving it into the elements LAND and LABOUR, explains the "natural" formation of societies and social classes, villages, towns, cities, and capitals; the "natural" variations of WAGES in different employments (due to time, expense and difficulty of learning, risk in work, capacity and trust required); the "natural" adjustment of SUPPLY of labour to DEMAND; contrast between real or intrinsic (normal) value, and market value—the first depending upon cost of production, the second upon supply and demand; the equation between land and labour; the minimum wage for family maintenance: the diffusion of wealth through the agency of the landed classes; conduct of European commerce by employers at a venture (robbers, beggars, artists, lawyers, etc., employers of their own labour); wages certain, profits uncertain; changes of demand (FASHION); population adjusts itself to the means of subsistence; labour the "natural" riches of a state: gold and silver convenient for money because useful, beautiful, durable, portable, divisible, easily transported and guarded, cognoseible, indestructible by fire, of equal goodness, not too cheaply produced, etc.

Part II. treats of BARTER; market prices; circulation of money in mass and rapidity; how much money does a country require? increased and decreased currency; effects of appreciation on fixed contracts and wages; CREDIT; INTEREST, its causes, rise and fall of rate, not dependent upon scarcity or abundance of money.

Part III. deals with foreign trade; FOREIGN EXCHANGES; variations in relative value of monetary metals; alterations of coinage; BANKS; national banks; reserves; guaranties; banking and credit.

The lost supplement included a precise and comparative account of the economic condition of the workmen of Europe as reflected in their expenses—much, apparently, upon the lines of LE PLAY's great work exactly one hundred years later (*Les Ouvriers Européens*, 1855). It described the actual diffusion of a large income; minutely analysed the cost of production of certain articles through their several component elements, etc. etc.

The execution of this ample programme is no less remarkable than its conception. Jevons thought Cantillon wrote "with the scientific precision of a CAIRNES or a COURNOT," and Prof. Marshall refers to his "thoroughly scientific manner" of discussion (*Prin.* vol. i. p. 593 n.) At once terse and subtle, he united close observation of concrete fact with keen deductive power. To consumption and demand he assigned an importance not generally recognised till much later. And his beautiful examples of accurate reasoning were rendered tedious to his contemporaries by very reason of his careful limitations and guarded hypotheses. The indirect influence of the book is difficult to trace. In France the *Essai* has been pretty continuously read (see e.g. GANILH, *Des Systèmes d'Économie Politique*, 2d ed. 1821, vol. i. pp. xv. 134; vol. ii. p. 107), and so stimulating and suggestive does it remain that its direct influence may be found to be not yet exhausted.

Essai sur la Nature du Commerce en général traduit de l'anglois. À Londres, chez Fletcher Gyles; dans Holborn, M.DCC.LV. (being reprinted for Harvard University, 1891). H. H.

Cantillon enunciates most of the leading principles of political economy relating to supply and demand, normal value, the rôle of the ENTREPRENEUR, population, currency, banking, and other important subjects. But it will be found that the statements often involve ideas peculiar to the writer, or the age; in particular, his difficult definition of value as regulated by quantity of land as well as of labour. The similarities between Cantillon's views and those now received are not more instructive than the differences. A full analysis of Cantillon's work, and an extreme estimate of its importance, will be found in Jevons's article on "Richard Cantillon and the Nationality of Political Economy," in the *Contemporary Review*, 1881. In *Investigations in Currency and Finance*, Jevons discusses Cantillon's remarks with respect to the statement on the ratio between gold and silver made by NEWTON.

F. Y. E.

It has been a matter of some difficulty to explain the connection of Richard Cantillon's

Essai with Paris, where it was published, and the influence it had on contemporary French economic thought. The following additional particulars respecting his life may assist in the elucidation of these points.

1. *The Life of Cantillon*.—One Richard Cantillon, probably a cousin of the economist, is described in some documents in the Archives Nationales, at Paris (E 804, p. 157; E 913, p. 253, and E 1948, fol. 98), under dates 1706, 1709, and 1718, as a merchant and banker at Paris, Rue de l'arbre sec. Among his customers were Irish Catholics, and he was "Receveur général de la lotterie accordée à la Princesse d'Angleterre en faveur des religieuses Irlandaises transférées à Ypres." In August 1717, the ticketholders in that lottery petitioned to have their claims settled, the deceased Richard Cantillon (E 913, No. 253), having left only 68,200 livres of assets, and 310,000 livres of liabilities. Another document (Y. 11080) states that after the decease of one Thomas Cantillon, an Irishman, officer in the regiment of Lally, in 1764, his brother Jean and his father Philippe Cantillon claimed to be his heirs.

The will of Richard Cantillon, of St. George's, Hanover Square (the economist) (Somerset House, dated the 12th July 1732, and proved the 21st May 1735), shows that he had bought a house in Paris through the intervention of Edmund Gough, and he names Francis Garvan and Lord Viscount Micklethwaite (died 1734) as his executors. Another point relating to Cantillon's position is mentioned by Horace Walpole, who writes 25th April 1743, to Sir H. Mann: "Lord Stafford is come over to marry Miss Cantillon, a vast fortune, of his own religion. She is daughter of the Cantillon who was robbed and murdered, and had his house burned by his cook a few years ago" [1734] (*The Letters of Horace Walpole, Earl of Orford*, ed. by Peter Cunningham, 1857, vol. i. pp. 241, 242, 298, and the works of *Jonathan Swift*, ed. by Sir W. Scott, 1824, vol. xvi. p. 262, 263).

2. *His Works*.—There are three editions of the *Essai sur la nature du commerce en général*; one of 1755, 430 pp. besides *table des chapitres*; one of 1756, 427 pp. and that of 1756 in the *Discours Politiques de Mr. David Hume*, traduits de l'Anglois par M. de M., Amsterdam, vol. iii. pp. 153-428, 1756. It is significant that Turgot's translation of Josiah TUCKER'S *Reflections on the Expediency of a Law for the Naturalisation of Foreign Protestants*, 1751-52 (*Questions importantes sur le Commerce à l'occasion des oppositions au dernier Bill de Naturalisation*, etc.), bears the name of the same publisher: À Londres, chez Fletcher Gyles, dans Holborn, 1755. That Gournay studied Cantillon is clear, for of Gournay it is said that "il fit surtout lire beaucoup *l'Essai sur le commerce en général*, par Cantillon, ouvrage excellent qu'on négligeait" (*Mémoires*

inédits de l'Abbé Morellet, t. i. pp. 37, 38, 1823). The work was highly praised by MABLY, *Entretiens de Phocion*, p. 239, 1763; and by GRASLIN, *Essai analytique sur la Richesse et sur l'impôt*, Londres, p. 365, 1767. The most detailed account of its origin has been given by the Marquis of MIRABEAU in his *Ami des Hommes*, vol. i. 1756. He holds Cantillon to be a Protestant (p. 58), professes to have adopted all his principles (p. 78), and frequently quotes passages of the *Essai* (pp. 34, 108, 115, 116, 171, 206). The seventh chapter too opens with a quotation and is followed by some details concerning its author. "He was," says Mirabeau, "without contradiction, the most clever man in these matters who ever existed. This work, one of a crowd of similar productions of the description then in fashion, is but the hundredth part of the writings of that ingenious man, which perished with him by a catastrophe both singular and fatal. This work itself is mutilated, for the supplement to which he often refers, and in which he had established all his calculations, is wanting. Cantillon himself had translated the first part for the use of one of his friends, and it was printed from this manuscript more than twenty years after the author's death" (pp. 237-239). In 1767 Mirabeau, expounding to ROUSSEAU the ideas of the economists upon the subject of population, and refuting his own former opinions, contained in the *Ami des Hommes*, says, he had borrowed them exclusively from Cantillon, "whose work I had had since sixteen years in manuscript" (i.e. 1740). See also his *Philosophie Rurale*, Amsterdam, 1764, t. ii. ch. ix. pp. 141, 142. Mirabeau was shaken in his belief by QUESNAY, who denied population to be the source of riches, and said "that Cantillon, as a political instructor, was a fool" (see *Rousseau Ses amis et ses ennemis, correspondance publiée*, par M. G. Streckeisen-Moulton, t. ii. p. 358, 1865). A rough MS. abridgement of Cantillon's *Essai*, of Mirabeau's own making, is among the "Papiers Mirabeau," at the Archives Nationales at Paris (M 779, No. 1). It contains a dedication "A. M. I. D. D. N.," no doubt the Duke of Noailles, "under whose auspices he had studied that part of politics which is based on 'imagination' (obviously contrasting this with 'Science' *Calcul*), and who had charged him never to forget that other part of the subject which depends upon calculation, and is included in the general name of commerce; if these matters are not studied from the very bottom, if their basis is not well laid, they incur the risk of being as frivolous and useless as many other essays on commerce." The essay which follows bears all the marks of revision by Mirabeau; it begins with what is p. 56 of the printed copy, but contains some passages, especially the introductory ones of the chapters, in addition to those contained in the printed book.

Cantillon's opinions were based on the economics of the commercialist school, and of some of his English physiocratic predecessors. The "equation between land and labour," which he quotes from PETTY, is contained in the latter's *Political Anatomy of Ireland*, ch. ix. 1691 (see *Tracts, chiefly relating to Ireland*, p. 344, Dublin, 1769). Like Adam Smith at a later epoch Cantillon combined the theoretical reasoning of the English with the systematic turn of the French, thereby promoting the economics of both countries.

[With Cantillon's view of the theory of rents compare J. Arbuthnot, *An Inquiry into the Connection between the present Price of Provisions and the Size of Farms*, p. 34, 1773.—Arthur YOUNG, *Political Arithmetick*, 2d part, p. 29, 1779, and Alex. Wedderburn of St. Germain's, *Essay upon the Question What Proportion of the Produce of Arable Land ought to be paid as Rent to the Landlord?* p. 4, Edinburgh, 1776. For Cantillon's part in economics see Dr. Bauer's remarks in *Quarterly Journal of Economics*, 1890, vol. v. No. 1, p. 102, and Dr. Bauer's article on the Physiocrats in Conrad's *Jahrbücher für National-ökonomie und Statistik*, Bd. xxi. H. 2 N.F., p. 145.—F. von Sivers, *ibid.* Bd. xxii. 158.—Prof. Marshall, *Principles of Economics*, 1890, vol. i. p. 53n.—H. Higgs, *Economic Journal*, vol. i. No. 2, p. 262.] S. B.

CAPELLO, PIER ANDREA, author of a book having the title *Nuovo trattato del modo di regolare la moneta*, published 1752 at Venice, and containing an analysis of the terms "value" and "price," for which it is still noticed in books of dogmatic history. M. P.

CAPITAINERIE. A privilege granted in France by the king, down to the time of the Revolution, to princes of the blood, by which they obtained possession of the property of all game, even on lands not belonging to them; including manors granted before to individuals; so that the erecting of a district into a *capitainerie*, was an annihilation of all manorial rights to game within it. Arthur YOUNG, *Travels in France*, 2d ed. vol. i. p. 600, says "in speaking of the preservation of the game in these *capitaineries*, it must be observed, that by game must be understood whole droves of wild boars, and herds of deer not confined by any wall or pale, but wandering, at pleasure, over the whole country to the destruction of crops; and to the peopling of the galleys by the wretched peasants, who presumed to kill them, in order to save that food which was to support their helpless children." The *capitaineries* were only one form of the oppressions of the seigneurs, which will be found described in considerable detail by A. YOUNG.

CAPITAL. Definitions in political economy present great difficulties owing partly to the fact that the words employed are in general drawn from ordinary language, and partly because the fundamental ideas often overlap, and it is

necessary to leave a debatable margin. There is probably no term in economics which has given rise to so much controversy as capital, and in the limits of this article it will only be possible to indicate the main points in dispute, and their bearing upon fundamental questions. As usual the historical aspect of the subject has been treated most fully by German writers (compare the masterly introduction of Knies to his work on *Money and Credit* (*Geld und Credit*); *Kapital und Kapital-Zins* by Böhm-Bawerk; and the article on "Capital" in Schönberg's *Handbuch*). The word capital is connected with *caput*, and in mediæval Latin we read constantly of the *capitalis pars debiti*, i.e. the principal sum as distinct from the interest. Thus originally the term seems to have been confined to loans of money. As the church forbade the lending of money for interest or usury (INTEREST AND USURY), and as this moral prohibition was generally given effect to by the law, all sorts of devices were resorted to in order to disguise the real nature of a loan (see CANON LAW). A thing was nominally bought by the borrower to be sold back after a time at a lower price to the lender (a dry bargain as it was termed), and gradually exceptions were admitted on the ground of wear and tear of the thing lent or indirect loss to the lender. In England before the time of the Tudors (compare Schanz, *op. cit. infra*) it had become generally recognised by merchants and legislators that it was impossible to distinguish between lending money itself and lending the things which had a money value. Thus in the natural course of historical development the term capital received a wider meaning. Accordingly later on we find TURGOR, as Knies points out, expressly saying that capital consists of accumulated values (*valeurs accumulées*), and that it makes no difference whether the accumulations consist of precious metals or of other things. Turgot states also that a man can live on capital, or rather the interest of capital, just as well as from personal labour or from funds derived from possession of lands. Thus capital is considered primarily as a source of profit. This historical usage of the term capital is still found implied in ordinary thought, and a Socratic inquiry on the modern mercantile mind would probably give as a first-fruit that capital is (1) *wealth which yields a revenue*.

It is quite obvious, however, as the writers on canon law were so fond of pointing out, that the precious metals are in themselves barren (*nummus nummum parere non potest*), and it is almost as obvious that any form of hoarded wealth is equally barren, that is to say unless it is actively employed so as to produce more wealth. In the earlier stages of agricultural development, for example, it is quite common to find that the stock is let with the land (and the custom still survives in the

mélager system), but unless the stock were used for productive purposes it could not possibly yield a revenue. It may further be noticed that although one private person may lend to another capital which may be used unproductively (e.g. money lent on mortgage) and the interest of which may still be paid punctually, it would be impossible for a whole nation (apart from lending to foreigners) to subsist on this barren use of capital. So much has this consideration impressed itself upon economists that many of them, especially English writers, have given as the root idea of capital (2) that *part of wealth set aside for future production* (see ABSTINENCE). This, for instance, is MILL's view to the exclusion of the older notion of revenue simply. Mill indeed makes the idea of production fundamental even in the case of individuals, and would only include in a man's capital that part of his wealth intended to be used in producing more WEALTH.

A little reflection, however, will show that either the meaning of production must be strained, or else the definition of capital thus obtained will be much more narrow than in the popular acceptance. In estimating, for example, the accumulations of capital in the United Kingdom in recent years Mr. Giffen (*Essays on Finance*, vol. i.) takes into account the movables, furniture, pictures, etc., in private houses, and roughly surmises that they amount to about half the value of the houses themselves, and although in a certain sense the term "productive" might be stretched to cover houses, it could hardly be made to cover pictures and ornaments. As the result of this line of criticism some writers (notably Knies) have made the fundamental idea in capital to be "wealth intended directly or indirectly to satisfy future needs." If a fair allowance be made for Adam Smith's want of scientific and technical phraseology his views on the fundamental nature of capital (or stock as he prefers to call it) come very near to this exposition. For Adam Smith carefully distinguishes between the wealth that is immediately consumed and the stock that is reserved or set aside out of a possible surplus. It is instructive to note that Adam Smith, in order to emphasise the distinction between INCOME and its source, or, in other words, between immediate consumption and capital, gives a very wide and unusual meaning to the term immediate. "A stock of clothes may last several years; a stock of furniture half a century or a century; but a stock of houses, well built and properly taken care of, may last many centuries. Though the period of their total consumption, however, is more distant, they are still as really a stock reserved for immediate consumption as either clothes or household furniture." In spite of the authority of ADAM SMITH, however, it may be questioned if it is advisable to give to the

term immediate such a paradoxical interpretation, and to exclude houses and the like from the capital of a country. A man, it may be argued, might well choose between living up to his income and saving so much a year in order to build a house for himself, and when once the house was built it would appear to form a part of the capital not only of the individual but of the nation. In fact, on analysis it seems that we ought to distinguish between immediate (in the more usual sense of the term) and deferred CONSUMPTION. Even from this point of view, however, it is impossible to take the term "immediate" too strictly, and it seems best to construe it relatively to the kind of income. The immediate consumption of a labourer earning weekly wages might be embraced within the week, whilst in the case of a high-salaried official a year might be taken as the unit, and in the case of a great nation spending money on armaments, etc., the term might be extended for some years. But even in this last example there is still a plain difference between building forts or strategic railways which are supposed to last for centuries, and providing for present wants by the personal equipment of soldiers. Practically it is of course always difficult to know how much may be fairly charged to capital account, and how much ought to be reckoned as part of immediate consumption. Logically, however, the distinction seems clear enough, and it has given rise to that description of capital (3) called by the Germans especially *consumption capital*. The principal difficulty in this conception of capital is that, in the language of one of Mill's "four fundamental propositions on capital," all capital is consumed, which, in the sense that nothing lasts for ever, is obviously true. Yet, even the schoolboy who decides between a tin-whistle and a penny pie, knows that the rate of consumption in the latter case is infinitely quicker than in the former, and it may be said that if he eats the tart he is only an unproductive consumer, whilst if he buys the whistle he is a small owner of consumption capital. And, in fact, Mill's object in this proposition appears to have been rather to emphasise the distinction between hoarding (the wealth not being productively consumed) and saving (the wealth being used as productive capital), (see ABSTINENCE).

So far then the result of the investigation on the connotation of the term capital appears to be that there are three species of capital in each of which a different quality is emphasised, accordingly as we consider (1) the yield of a revenue, (2) the production of more wealth, (3) the reservation of means for future enjoyment. It remains then to consider whether there is not some root-idea from which these three branches spring. The line of thought suggested by ADAM SMITH and developed by

Knies is found to lead to this result:—*Capital is wealth set aside for the satisfaction—directly or indirectly—of future needs.* This satisfaction may be obtained by the individual by lending his wealth at “usury”—“usury of money, usury of virtuals, usury of anything that is lent upon usury”—or by reserving means for future production as in the case of the husbandman and his corn or cattle, or by laying up for himself a treasure which will be a delight for many days.

In the different departments of political economy the stress is laid in general on one of these three characteristics to the exclusion of the other two. In the department of production, for example, as the very name implies, capital is regarded almost entirely as one of the principal agents in production, as sustaining or auxiliary to labour. Logically, it is not necessary to consider at this stage how the product is divided, or even that it is intended for future or immediate consumption. But in the departments of distribution and exchange, the characteristic of yielding profit or revenue is fundamental, whilst in taxation several questions of importance spring from the distinction involved in consumption capital.

The principal points of fundamental importance in the qualitative definition have now been considered, but there are several minor questions which have given rise to much controversy. (1) *Is all capital the result of labour, and ought we to exclude the forces and free gifts of nature?* The answer, as in all questions of definition, must depend purely on the convenience of the classification for the subject or problem in hand. In the department of PRODUCTION it is often necessary to contrast capital in the sense of accumulations due to labour (*festgeronnene Arbeit-Zeit* as the German socialists phrase it) and “the natural and indestructible powers of the soil” of RICARDO, as, for example, that no exception may be taken to the language, advantages of situation. In the department of DISTRIBUTION, again, stress is often laid on analogies between the limitation of natural sources of supply (and the consequent UNEARNED INCREMENT) and the ordinary forms of capital, which with sufficient labour are capable of indefinite extension at an ordinary rate of profit. On the other hand, however, it is extremely difficult practically to draw the line between the gifts of nature and the results of labour, and between earned and unearned increments. Even sheep farms in mountain districts require a certain amount of surface drainage, fencing, etc., and once the necessary labour has been bestowed, it is hard to tell how much is due to man, and how much to nature. If we consider the question from the national point of view, and take, as is natural with a nation, long periods, the labour in the mere appropriation or first occupancy of the

natural sources will be found to be considerable. Compare for example the condition of England before the invasion of the Romans and during the Roman occupation, or mediæval England with the England of to-day. Rivers have been diverted, extensive forests cleared, swamps and marshes drained, and natural harbours improved and protected. Thus even in production it would not seem unreasonable to include these so-called natural sources, in order to emphasise the fact that they can only be made available, as with other forms of capital, by the labour and ingenuity of man. And although this admission is made, it would still be possible to discuss Adam Smith's favourite position that in some things, notably agriculture, nature labours with man to a greater extent than in others, e.g. the manufacture of scientific instruments of great delicacy. It may be observed that in estimates of national capital, such as that made by Mr. Giffen, not only is land included, but it stands first on the list in order of importance. It is obvious also that the capital value of land would certainly include from the practical standpoint the minerals, etc. not yet extracted, as well as the value due merely to such a quality as situation. Logically, any difficulty may be technically overcome by speaking (with HELD) of the “labour of appropriation,” especially if we take into account the contribution made by the state as such to the organisation and security of labour. (2) A second controversy has arisen on the question on which Mill lays such stress, namely:—“*Does the distinction between capital and non-capital depend on the intention of the capitalist, or in other words, the owner of the potential capital?*” If the answer be in the affirmative, we are confronted with the difficulty from the point of view of the individual, that the same thing would at one time—even on the same day—be considered capital, and at another non-capital. Thus Professor Marshall in the *Economics of Industry*, argues that a doctor's carriage when used on professional visits would be capital, but when used for pleasure merely would not be capital. (Compare, however, the later treatment by the same writer in the *Principles of Economics.*) This difficulty, however, would be overcome by admitting the species of consumption capital. Again, there are certain forms of wealth, machinery, tools, instruments, etc., which from their nature could only be considered as capital, whilst other forms, e.g. seed-corn in a famine, may or may not be immediately consumed according to the intention of the owners. After all, however, the difficulty is only one of degree, and, as in other cases, we may leave open a debatable margin in the case of the individual, whilst with a nation it would be easy to determine roughly by means of statistics

between the amount of goods or wares immediately consumed and the amount on the average reserved directly or indirectly for the future. On the whole it may be doubted if it is possible or desirable to arrive at the *intention* except by arguing from the accomplished fact, or from the nature of the things, and the only use of the discussion is to emphasise again the fundamental distinction between the satisfaction of immediate and future needs.

(3) A third question has been much debated, which is, however, more properly dealt with under WEALTH (*q.v.*), namely:—*Does capital include what are called immaterial as distinct from material utilities?* The answer is similar to that in question (1) as to the connection between LABOUR and capital, and must depend on the convenience of emphasising, or not certain points of analogy and contrast. On the one side the “fixed skill” of a workman is in many respects similar to the nice adjustment of the wheels of a machine, and resembles still more closely the trained qualities of the domestic animals. The objection that the skill is attached to the man may be answered, as by Mill, that a coal mine is also attached to a place, or, still better, by the analogy that in matters of contrast the technical skill may be considered as separated from the higher qualities of the personality of the individual. On the other hand, however, it is often necessary to contrast the worker with the work done, and the wealth produced with the people for whom it is produced. By some writers (*e.g.* LIST) the acquired skill of a people, the greater part of which has been inherited from the past, and is due to the labour, and saving, and self-restraint of past generations, is reckoned as the most important element in the national capital, and both in the department of production and in distribution the contribution of this “social capital” to the annual produce must be carefully considered. The principal reason why a civilised nation can so soon recover from the effects of a devastating war is to be found in the acquired skill of the inhabitants, and the same remark applies to the rapid development of new colonies. Thus Adam Smith might well include the skill of the workers in a nation in its fixed capital. But when, as is usual in questions of economic definition, we appeal to popular usage, we find that hitherto, at any rate, the contrast has overcome the analogy. No statistician has yet attempted to give, even roughly, a value to this “social capital,” or to estimate the capital value of the skill of labourers, although in particular cases, such as compensation for injury or death, some such computation must be made. The distinction will be found to be of vital importance in discussing the connection between capital (in the narrower sense) and WAGES.

Besides the skill of the inhabitants of a

country are other so-called immaterial utilities which have sometimes been included in capital, and sometimes excluded. PRECIOUS METALS which form the material money of a country have always been included under its capital, and the question arises whether, if an efficient substitute can be found, this substitute is not equally capital. There can be no doubt that without the banking organisation of the United Kingdom the business even of producing wealth could not be carried on, at least to the same extent. BANKING is an essential part of natural division of labour, and BANK NOTES and other forms of representative money are quite as efficient agents of production as the precious metals themselves. These questions are, however, discussed separately under CREDIT (*q.v.*) From the individual point of view such immaterial utilities as the GOOD-WILL of a business, COPYRIGHTS, PATENTS, and the like would fall under capital unless the material characteristic is considered essential.

Besides the three species of capital already discussed there are other divisions which have found a place in the text-books. The most important is the distinction between fixed and circulating capital. Adam Smith took the terms apparently in their literal sense and considered the essence of the difference to lie in the fact whether or not the capital changed hands (or circulated) in order to obtain a revenue. “If it (*i.e.* stock) is employed in procuring future profit (as distinct from present enjoyment) it must procure this profit either by staying with him or by going from him. In the one case it is a *fixed*, in the other it is a *circulating* capital.” *Wealth of Nations*, bk. ii. ch. i. Mill, on the other hand, and most recent English economists, define circulating capital, as that which performs the whole of its functions in a single use, whilst fixed capital can be used more than once in the same way. Of course in particular cases it would be difficult to draw the line accurately, but the broad distinction is quite obvious. Compare and contrast, for example, machinery as the type of fixed, with food supplies and raw materials of manufacture as the types of circulating capital. Very often by English writers circulating is used as equivalent to wages capital. Thus, under the title of the conversion of circulating into fixed capital Mill really discusses the effects of the introduction of machinery upon the working classes (see WAGES, MACHINERY). This confusion between circulating and wage-capital has been one of the causes of the extreme and untenable form of statement of the wages-fund theory, and of the narrow views of the relations of industry and capital expressed in Mill’s four fundamental propositions (*Political Economy*, bk. i. ch. v.) The terms sustaining and auxiliary capital seem to be more free from ambiguity or question begging. Other

divisions of capital are sufficiently described by the words used *e.g.* floating and sunk, specialised and non-specialised, etc.

It may here be observed that, considering the complicated controversies which have arisen in connection with the definition of capital, it is often useful to employ qualifying adjectives when the term is applied beyond the limits within which there is no dispute. We might, for example, speak of the skill of a workman as personal capital, and the various industrial organisations of a nation as social capital. It seems also worthy of remark that those writers who take the most narrow definition of capital, and confine it merely to material production-capital, really bring in the wider content of the idea, indirectly under different headings, *e.g.* the accumulation of capital, the efficiency of the industrial agents, organisation of industry, the influence of credit, etc. Thus it often happens that a writer imagines that he has made some important discovery on the nature of capital when he has simply made an alteration on the arrangement or classification of topics, a most useful operation if well carried out, but of subordinate importance to a positive addition to the materials of a science. The latest systematic work on *Capital (Kapital und Kapital-Zins)* by E. von Böhm-Bawerk, which is full of excellent material from the historical standpoint, gives many examples that incur some part of this stricture.

In conclusion it must be allowed that it is impossible to thoroughly discuss such a comprehensive term as capital without travelling over every department of economics. Similarly a complete bibliography would involve a reference to almost every important economic work.

[Besides the works referred to in the text, special attention may be called to the following. On the historical side (that is of fact, not theory), as regards antiquity one of the most instructive works on the effects of capital is Mommsen's *History of Rome*. In the mediæval period the work of Schanz, *England's Wirthschaftliche Entwicklung*, etc., gives excellent material from the Saxon to the Tudor period; Thorold Rogers on *Six Centuries of English Work and Wages* and Brentano on *Gilds and Trade Unions* give the later development. On the history of the theory the principal works have already been noticed. On the theory in recent times, the reader may consult the chapter on "Capital" in the *Principles of Pol. Econ.*, by Prof. H. Sidgwick, for an excellent analysis of "common" and scientific English thought; and the various works of P. Leroy Beaulieu, *e.g.* *La Répartition des Richesses: La Science des Finances*. The work of Karl Marx (*Das Kapital*) which has been translated into English, must be read with caution as regards the deductions from the masses of adroit quotations from English sources, whilst the central theory has not been accepted by any economist of repute though still apparently the basis of German socialism. Compare A. Held on *Sozialismus und Capitalismus* and

Schäffle on the *Quintessence of Socialism* (translated into English). List on *National Systems of Political Economy* may be compared with the *Wealth of Nations*, bks. ii. and iv.] J. S. N.

History of the word.—The word "capital" in its economic sense, like the word "principal," and like the word "capital" itself in its geographical sense, is an adjective elliptically used as a substantive (Murray, *New English Dictionary*, s.v.) The full phrase is "capital stock." "Capital" was used for "capital stock," at least as early as 1635 (*e.g.* in Dafforne, *Merchant's Mirrour*, Ex. No. 96), but the fact that it was merely an adjective was by no means forgotten. The Act 8 & 9 W. and M. c. 20 (1697) "for enlarging the capital stock of the Bank of England," provides that before the enlargement is made, "the common, capital, and principal stock of the said governor and company shall be computed and estimated by the principal and interest owing to them by the king, or by any others, and by cash, or by any other effects whereof the said capital stock shall then really consist over and above the value of the debts which they shall owe at the same time for principal and interest to any other person or persons whatsoever." In Dyche and Pardon's Dictionary, 1785, the article on "Capital" begins, "Chief, head, or principal; it relates to several things, as the *capital stock* in trading companies is the fund or quantity of money they are by their charter allowed to employ in trade." Adam Smith frequently uses the full phrase. E. C.

Legal ruling that Capital need not be replaced from profits.—A trader's assets are in most cases wholly or partly of a perishable nature. Before ascertaining the profits derived from such assets in a given year provision ought to be made for the depreciation estimated to have taken place during that year. If, for instance, a person who invested £1000 in the purchase of a patent having five years to run, and producing an annual profit of £500, treats the whole of the annual £500 as the profit of the respective year, he will find, at the end of the five years, that his source of income has disappeared. If, on the other hand, at the end of each year a sum of £200 is carried to the credit of a sinking fund and the remaining £300 only are treated as income, the owner of the patent will at the end of the five years be able to invest his original £1000 in some other profitable manner. Where the facts are so very plain this seems almost a truism, but in many cases it is more difficult to distinguish between income in the proper sense and repayment of capital. The inquiry ought, however, always to be made and acted on. The importance of taking the depreciation of property into account in ascertaining the profits of a given year is even more obvious in the case of a company than in the case of a private individual. The gradual disappearance of wasting property must in the end

materially damnify PREFERENCE shareholders, DEBENTURE holders, and ordinary creditors, and must also cause great injustice as between the persons entitled to the income of shares for limited periods and the persons ultimately entitled to the property of the shares. It seems strange that although the integrity of the capital of limited companies is, in other directions, most jealously watched by our courts, the greatest laxity is allowed with reference to the valuation of assets of a wasting nature.

In the leading case of *Lee v. Neuchatel Asphalte Company* (Law Reports, 41 Chancery Division, p. 1) it was held by the Court of Appeal that "there is nothing in the Companies Acts to prohibit a company formed to work a wasting property, as *e.g.* a mine or a patent, from distributing, as dividend, the excess of the proceeds of working above the expenses of working, nor to impose on the company any obligation to set apart a SINKING FUND to meet the depreciation in the value of the wasting property."

The following observations of Lord Justice Lopes deserve special notice—"It is said by the appellant that a company is not at liberty to pay a dividend unless they can show that their available property at the time of declaring the dividend is equivalent to their nominal or share capital. In my opinion such a contention is untenable. Where nominal or share capital is diminished in value, not by means of any improper dealing with it by the company, but by reason of causes over which the company has no control, or by reason of its inherent nature, that diminution need not, in my opinion, be made good out of revenue."

The result of the doctrine so laid down may be illustrated by an example. A company having invested the whole of its capital in licensed premises at a price securing an excellent return during the continuance of the licence, divides the whole of the net revenue in each year among its shareholders. The licence is withdrawn before the dividend for the last year has been declared. This is a diminution of the value of the company's property "by reason of causes over which the company has no control," and the company may divide the whole of the last year's profit among the shareholders, although the value of the land and buildings since the withdrawal of the licence is far below the amount of the debts owing by the company. We are bound to bow to the ruling of the Court of Appeal, and must therefore assume that this result is in accordance with the Companies Acts, but economically it cannot be considered sound; while, from the point of view of persons having dealings with limited companies, and relying on the correctness of their annual balance-sheets, it is highly inconvenient, and further it contradicts every sound principle of business and of bookkeeping.

E. S.

Capital rarely permanent.—The constant need of renewal of capital is a point often not remembered. Capital, as Professor Sidgwick says (*Principles of Political Economy*, ch. v.), is "a semi-technical term, being habitually used not by men generally in their ordinary thought, but by men of business and others when discussing industrial matters," "In its original use by practical men," Professor Sidgwick continues, "capital" undoubtedly means "wealth employed so as to yield a profit." The distinctions which, as Professor Sidgwick shows, must be made as to the use of the term thus defined, are stated under the head of CAPITAL (*g.v.*), the remarks on the subject in this place are confined to the point—that the "wealth" thus "employed" stands constantly in need of renewal. Whether "capital" exists in the form of machinery or any other finished product of intelligent skill, or in the form of the floating capital or cash used in paying the labour employed in keeping that machinery in motion, or in purchasing the materials needed to maintain any product of intelligent skill—a mint for instance in working order—constant renewal is, in by far the greatest number of cases, needed to maintain not merely its efficiency, but its very existence. A railway, for example, needs not merely a continual repair but perpetual reconstruction, which has properly to be charged to the fund which is properly profit, but which in this technical sense is called "revenue." As traffic increases new rails have to be laid down, old stations enlarged and renewed, old bridges replaced by new ones capable of bearing the heavier weights of the more powerful locomotives and the larger trains which they draw. In cases like this "capital"—the word is used here in the technical sense described by Professor Sidgwick—has already been charged with the cost of construction of the stations and bridges which are now superseded, and hence have to be rebuilt. It is "revenue" therefore, the produce of "capital," not capital itself, which has to bear the cost of the renewal so far as this renewal merely replaces what is actually superseded. Thus, in the case of a station which cost originally £10,000, and owing to the increased traffic has become insufficient to meet the needs of the locality, and has to be replaced by one costing £50,000, in all well-managed railways the rule is that capital bears only the difference between the two sums, and revenue is charged with the replacement of the original outlay. This example is given as merely one instance of a process which has to be followed in every instance in which "capital" has to be perpetually maintained, however it is employed. It shows further, not only the proper method of apportioning the difference between gross and net "revenues," that is between gross and net profit, but the very heavy drafts which must con-

stantly be made on "revenue," that is on net "profit," to meet a class of expenditure which to many appears exceptional, but which is really a normal incident in the cost of production. When examined into thus, it is interesting to trace how little of what is ordinarily termed "fixed" capital is really permanent. The apparent permanence of "capital" is occasionally spoken of as something which may always be depended on, something which endures for ever. Because the payment of the interest on the "debt" of a nation, or the "stock" of a company is continued from year to year, it is assumed that the wealth represented by the original outlay continues in existence and that the "capital" remains—capital described as the "saved produce of past labour." The "capital" considered either in the concrete as (mainly) the accumulated stock of instruments auxiliary to labour, or more abstractedly as the power of directing labour to the attainment of greater but remoter utilities through the control over the produce of labour possessed by the owners of accumulated wealth," is only maintained through a perpetual process of reproduction.

[See Mill, *Principles of Political Economy*, bk. i. ch. v. For connection between κεφάλαιον, *caput*, and capital, see Macleod, *Dictionary of Political Economy*, s.v. "Capital," pp. 324-67, and Roscher, *Volkswirtschaftslehre*, p. 89, § 42.]

CAPITATION (IN FRANCE). The *capitation* was a graduated poll-tax, first imposed in 1695 during the war with the league of Augsburg; abolished in 1697, on the conclusion of the treaty of Ryswick, it was renewed when the war of the Spanish Succession broke out in 1701. From this time it became a regular source of income until the Revolution.

The imposition of the *capitation* is a proof of the immense power of the monarchy under Louis XIV. No consent was asked, and no regard was paid to class privileges. The tax was to press upon all classes including the nobles. The mendicant orders, and all whose contributions to the state did not exceed 40 (afterwards 20) sous were exempted. The rest were divided into twenty-two classes according to rank, with a diminishing scale of payment. The first class, which consisted of the dauphin alone, paid 2000 livres; the second, viz. the princes of the blood, paid 1500; and so on to the four lowest classes, which paid respectively 40, 30, 10, and 3 livres. In principle, at least, the tax was more equitable than any other in France.

The nobles and clergy had been powerless to prevent the imposition of the tax, but they soon succeeded in modifying its assessment in their own interests. The clergy, in fact, succeeded in escaping it from an early period. In 1695, and again in 1701, they agreed to pay 4,000,000 livres a year as long as the war lasted. In 1709, when the government was reduced to the greatest straits, they purchased permanent im-

munity from the *capitation* by an immediate payment of 24,000,000 livres, most of which they raised by loan. The *pays d'état* and many of the towns compounded for a fixed annual payment, as in the case of the *taille* (see *TAILLE*). The nobles obtained the appointment of special receivers for their own order, and succeeded in escaping great part of the burden.

But the most fatal change was the adoption (in those provinces where the *taille* was levied on personalty) of the assessment for the *taille* as the basis of that for the *capitation*. The division of the twenty-two classes was soon lost sight of, and the burden upon the lower classes was enormously increased. If the *taille* was increased, the *capitation* of the *ROTURIER* was *ipso facto* increased too. Thus the practice grew up of collecting the tax first from the non-privileged, and then, if there was a deficit, it was imposed upon the privileged classes. Thus it was reckoned that in 1788 a *roturier* paid about 12 sous per livre; and a noble only 2. The class which ought to have paid 3 livres by the original arrangement had come to pay 24; the class which ought to have paid 10 paid 60, and that which ought to have paid 30 paid 180. This enormous change was produced within a century, not by formal enactment, but by the steady pressure of the privileged classes upon the administration. The result was disastrous to the state, as the tax, according to NECKER, only produced 41,000,000 livres, whereas it was estimated to produce 54,000,000.

R. L.

CAPITATION TAXES. Taxes directly imposed on each individual to be charged therewith, the amount payable being either a uniform sum or, as in later times, a sum regulated by reference to a prescribed scale varying with the rank and station, and, in some instances, with the supposed fortune of the person charged. Such taxes are frequently described as poll taxes.

The first *capitation* or poll tax was imposed in England in 1377 at the uniform rate of 4d. per head. It is stated in the Subsidy Roll printed in the *Archæologia*, vii. 37, that the sum produced was £22,607 paid by 1,376,442 persons, although, as Mr. Dowell remarks, the "sum raised does not correspond with the stated number of taxpayers." In 1379 and 1380 graduated poll taxes were imposed, the tax levied in the latter year leading to the movement in which Wat Tyler was the moving spirit. Thereafter, *capitation* taxes were levied at rare intervals, the principle of classification being present in all of them and on an increasingly elaborate basis. In 1692 a poll tax paid in each quarter of that year produced £530,000, and in 1698 a similar tax estimated to yield £800,000 pro-

duced no more than £321,397. "When a tax," said DAVENANT, "yields no more than half what in reason might be expected from it, we plainly see that it grates upon all sorts of people; and such ways and means of raising money should be rarely made use of by any government." Accordingly, the poll tax of 1698 was the last imposed in this country, although the system survives in several European countries.

Adam SMITH (*Wealth of Nations*, bk. v. chap. ii. art. iv.) condemns capitation taxes as altogether arbitrary and uncertain, to which he adds that "the greatest sum which they have ever afforded might always have been found in some other way much more convenient to the people." It may, however, be said, that it is in the inequality of capitation taxes, rather than in their uncertainty or arbitrary character, that the essential objection to them consists. They need not necessarily be uncertain, and their arbitrary character depends mainly upon the manner in which they are administered. If levied, however, without distinction of age, sex, or fortune, they are so manifestly unequal that they have been described as the taxation of men as if they were beasts, and as constituting "a mark of slavery." And even when attempts have been made to remedy this inequality by suitable gradations, sufficient care has seldom been taken in constructing them to avoid the imposition of a direct burden upon those above the condition of beggary but possessed of the means of a bare subsistence only. Graduated capitation or poll taxes may be described as rough and ready attempts to achieve that species of direct taxation which is more scientifically accomplished by a well-constructed income tax (see INCOME TAX), to which tax, as then known, many of the observations of the earlier economists on the subject of capitation taxes are indeed equally directed.

T. H. E.

[See Dowell's *History of Taxation and Taxes in England* (London, 1888).—Block's *Dictionnaire Général de la Politique* (Paris, 1873).]

CARACCIOLI, DOMENICO (marquis and viceroy of Sicily), born in Naples 1715, died 1789; published (1785) a pamphlet on corn laws, having seen their bad consequences during a great famine which devastated Sicily in 1784 and 1785. However, he is not a thorough free trader, and he is more of a political writer than an economist. CUSTODI published his pamphlet in his *Economisti classici Italiani*, Milano, 1804.

M. P.

CARAFA, DIOMEDE, perhaps the first serious writer in Italy on public finance. When he was born is not known. He died in 1487. He was duke of Maddaloni and was invested with the highest political offices under Alfonso I. of Aragon, who only succeeded in taking Naples from Renato of Anjou through the bravery and ability of his captain Carafa.

Carafa's book consists only of eighty-eight pages, and its full title is: *De regis et boni Principis officio opusculum a Diomede Carafa, primo Magdalunensium Comite, compositum*, Neap. apud Castaldum, 1668 (edition now circulating). He wrote his book between 1469 and 1482 in Italian, and the Duchess Eleonora, daughter of Alfonso I., and wife of Ereole I., Duke of Ferrara, whose instructor Carafa had been, directed it to be translated into Latin. It is divided into four parts: (1) *De imperio tuendo*, (2) *de jure dicendo et justitia servanda*, (3) *de re familiari et vectigalibus administrandis*, (4) *de subditorum civitatisque commodis procurandis*.

In the third part, which is the financial one, of his treatise, Carafa makes some original remarks. He maintains that the revenue must be regulated in proportion to the expenditure, and that this has three principal divisions—expenses for the protection of the state; those necessary for the court of the prince; and lastly a category of varying importance relative to the general welfare of the state. As this last category is the variable and unforeseen one, whilst the two other ones are certain, the greatest possible margin should be left for it on the side of income, and the other expenditure should be reduced to a minimum. The revenue should be minutely accounted for and examined into every year by a special body of officers. Taxes should be stable and in every detail indisputable (Carafa says: taxes should be formulated so clearly that people need not go to law about them to know *what they have to pay*) and not oppressive; but taxes will be certain to be oppressive if the greatest economy does not prevail in the expenditure. Economy in the expenditure makes it possible for the prince to choose amongst the many possible taxes only the very best, and eliminate especially those which are iniquitous or unequal in their incidence. Moderation in the expenses will also have the good effect that the prince need not have recourse to forced loans, which he thus characterises, "*Quid aliud existimari debet, quam tutum quoddam rapinae aut furti genus?*" Such loans induce population and capital to emigrate, and it would be highly immoral for the prince to endeavour to search out where wealth was, by employing spies so as to plunder his subjects the better. He thinks the collecting of taxes ought to be farmed out, because the "publicans" act with greater zeal, intelligence, and activity than government officials. Carafa clearly recognises that the wealth of the subjects is the foundation of the whole state machinery, and must therefore be spared, "Subditorum facultates potentie regiae fundamenta existimari oportet." Far bolder than St. THOMAS AQUINAS (*q.v.*), Carafa does not fear moral evils from a development of commerce, the first great source of the wealth of subjects;

therefore commerce must be left absolutely free. Carafa's powerful intellect discerned how beneficial for a country are foreign merchants who settle in it, and strongly opposed every sort of oppression tending to give foreigners a position inferior to that of native citizens. His formula of liberty is "Sicut indignum est a civibus officia Regentis invadi, ita civium negotia occupari a Rege non decet." Nevertheless Carafa cannot yet quite free himself of the prejudice that state-help is of some good, and he advises the prince to lend money, to give prizes and aid industry in many other ways, since the prince, he says, is sure never to lose in the long run by doing so, because "princeps inops esse non potest, ejus imperio ditissimi homines subjiuntur." Especially agriculture needs the indulgence of the prince, because peasants often need loans, and when the seasons have not favoured them, the tax collectors ought not to aggravate their situation, but give them a little time to pay their taxes and their debts. The labour of the subjects is the source of the wealth of a nation and the government must never crush them and if it can, must help them; "*nec tamen negaverim non posse hoc (state-help) ab omnibus et ubique praestari; sed ubi et facultatum copia, et locorum commoditas suppetit, ibi subditos a Principibus suis, et consilio, et re excitandos adjuvandosque esse assero.*"

Is it not remarkable to find a statesman and a warrior of those rough times speaking in such terms?

M. P.

CARBONARI. This secret society (referred to in the notice of the life of Etienne CABET), claims a history of much antiquity, and Francis I. of France as founder. Its recent activity dates, however, mainly from the revolutionary period, at the close of the last century, when its principal sphere of action lay in Italy. The project formed by the society of a united Italy, under the name of the Ausonian Republic, proved abortive; but the fall of Murat was in great measure due to its influence. After the restoration of the Bourbons, however, to the kingdom of Naples, the Carbonari were thrown on one side, and the society was proscribed throughout Italy. Expelled thence, it began to take root in France, and Lafayette became its chief (c. 1820-1821). After many vicissitudes the society was revived about 1825, and some ten years later coalesced with the society named Young Italy. The course which the society of the Carbonari took marks "a transition period in the history of secret societies. From secret societies occupied with religion, philosophy, and politics in the abstract, it leads us to the secret societies whose objects are more immediately political. And thus in France, Italy, and other centres it gave rise to numerous and various sects, wherein we find the men of thought and those of action combining for one common object—the progress, as they

understood it, of human society" (Heckethorn, vol. ii. p. 115).

[For literature, see *The Secret Societies of all Ages and Countries*, C. W. Heckethorn, 2 vols., London.]

CARDOZO, ISAAC N., born in 1786 in Georgia, U.S., settled in Charleston, S.C.; engaged in journalism, and died in 1850. In 1826 wrote *Notes on Political Economy*, Charleston, S.C., pp. 125. This was called forth by the publication of Professor M'Vickar's edition of M'CULLOCH's article on "Political Economy," originally published in the *Encyclopædia Britannica*, a statement of the principles of political economy which Cardozo regarded as erroneous when applied to the United States. The Ricardian theory of rent was especially attacked; many critics at that time saw that the conditions of land tenure and cultivation were so different in the United States from those in England that they concluded that RICARDO's theory was fundamentally erroneous. As editor of the *Southern Patriot*, 1816-45, and of the *Evening News*, 1845-50, Cardozo wrote in favour of free trade, and showed an unusual acquaintance with the subject of finance. He frequently contributed to the *Southern Quarterly Review*.

D. R. D.

CAREY, HENRY CHARLES (born in Philadelphia, United States, 1793, died in that city 1879), was the son of Matthew Carey, an Irish exile, who had become a man of mark as a publisher, and as a writer on economic and political questions. The son succeeded his father as head of the publishing house, but retired with a competency in 1835, and from that time devoted his energies to economic science and related subjects. Thirteen octavo volumes and three thousand pages of pamphlets remain as the fruit of his activity, besides an amount of matter, supposed to be twice as great, contributed by him to the newspaper press. Of his more important works there are translations in French, Italian, Portuguese, German, Swedish, Russian, Magyar, and Japanese, attesting his remarkable power of commanding attention in spite of the difficulties created by great prolixity, eccentric style, and frequent obscurity of thought.

Carey began his scientific career at a juncture when the ENGLISH SCHOOL appeared to have exhausted its deductions from assumed premises, and to shrink from adjusting its conclusions to the conditions of actual life. His treatment of SOCIAL SCIENCE was original, and led him to a series of supposed discoveries, the order of which he has stated in the introduction to his most important work, *The Principles of Social Science*. His point of departure was a theory of VALUE which he defined as the "measure of the resistance to be overcome in obtaining things required for use, or the measure of nature's power over man"—in simpler terms

Q

the cost of reproduction. This theory Carey applied to every case of value—to commodities, services, and land, and in some passages seemingly to man himself. Reasoning that every gift of nature is gratuitous, he found a universal tendency to a decline of value as the arts advance, and to a decrease in the value of accumulated capital, as compared with the results of present labour, with a resulting harmony of interests between capitalist and labourer. This theory Carey enunciated in his *Principles of Political Economy*, published in 1837-40, and its appearance in slightly modified terms in BASTIAT'S *Harmonies Économiques* in 1850, led to a sharp discussion between the two authors, in the *Journal des Économistes* for 1851. The attempts of Dühring in Germany to establish the claims of Carey as a reformer of economical doctrine, led to an equally sharp controversy between Dühring and LANGE, in which the latter had the best of the argument.

Ten years later, in his *Past, Present, and Future*, Carey announced a law of production from land the exact reverse of RICARDO'S. With great wealth of illustration, he laid down the principle that, in the progress of society, men first till the easily worked and poorer soils, and descend upon the richer lands as capital and numbers increase, so that with the advance of the community the rate of return from land rises instead of falling. Closely connected with this supposed reversal of Ricardo's doctrine, and a natural deduction from the continually increasing ability to support increasing numbers, was the total rejection of the Malthusian law. Logical necessity, however, forced Carey to seek for some ultimate limiting principle, and this he found at last in Herbert Spencer's conjectured physiological law of the diminution of human fertility, and ultimate equilibrium between numbers and subsistence. It may be also noted in passing, that with the Ricardian and Malthusian doctrines Carey also abandoned his earlier belief in free trade, from a conviction that, in the present state of the world, the co-ordinating power of the government must be used, in order to preserve economic harmony and to arrive at ultimate freedom.

Finally, in the second chapter of his *Social Science*, Carey announced the crowning discovery of "the great law of molecular gravitation as the indispensable condition of the existence of the being known as man." The laws of being he declared to be the same in matter, man, and communities. As in the solar world attraction and motion are in the ratio of mass and proximity, so in the social world, association, individuality, responsibility, development and progress are proportionate to each other. This theory, not of analogy, but of absolute identity of law, in the physical and in the social world, is maintained with

great vigour in the *Unity of Law*, published when Carey was in his seventy-ninth year.

The scientific importance of these theories has been maintained by Dühring, Ferrara, and Wirth, and has been questioned by HELD and Lange. However revolutionary the theories may be logically, they had, outside of the middle United States, little effect in establishing a school, even in the author's lifetime, and since his death, under the changed conditions of economic discussion, have ceased to attract much attention.

In his own country, Carey is probably best recollected as an advocate of the policy of protection. This policy he urged upon grounds so unusual, that it may be said that, in the discussion, he seldom pursued his opponents far upon their own lines of argument, nor has he often been followed by them upon his own. The central point of his social philosophy was the importance of association as the primary condition of progress. In mere trade, as between countries exchanging manufactured goods and raw products, he found an influence which centralises power and wealth on the one side and acts towards dispersion and decay on the other; but in the commerce of services and ideas carried on by men exchanging with each other directly, he found a tendency to closer association, increased economic efficiency, and general well-being. His treatment of INTERNATIONAL TRADE, then, turned chiefly upon the stimulus to be given to producers by the home market, a consequent rapid societary movement, an early diversification of pursuits, quickened thought, and a resulting gain in productive power. In this manner he developed many of the arguments for the protective system which have now become common, and perhaps helped in giving to those arguments a currency much wider than the acceptance, or even the knowledge, of his general system, among protectionists to-day. (See AMERICAN SCHOOL OF POLITICAL ECONOMY.)

Carey held no public office, but his mental and social qualities made him for many years a central figure among men of cultivation and influence in his own community. A brief memoir of him was published in Philadelphia (1880) by his friend, Dr. William ELDER, from which is taken the following list of his principal works, omitting the long catalogue of pamphlets:

Essay on the Rate of Wages, 1835.—*Harmony of Nature* (privately printed), 1836.—*Principles of Political Economy* (3 vols.), 1837 '38 '40.—*The Past, the Present, and the Future*, 1848.—*Harmony of Interests, Agricultural, Manufacturing, and Commercial*, 1850.—*Slave Trade, Domestic and Foreign*, 1853.—*Principles of Social Science* (3 vols.), 1858-59.—*Manual of Social Science* (edited by Miss M'Kean), 1864.—*The Unity of Law, as exhibited in the relations of Physical, Social, Mental, and Moral Science*, 1872.

Closely related to the above is the *Manual of Political Economy*, by E. Peshine SMITH, 1863. The Claims of Carey to a high place among modern economists have been maintained in Germany especially by Eugen Dühring (*Carey's Umwälzung der Volkswirtschaftslehre und Socialwissenschaft*, 1865) and in America especially by Mr. Carey-Baird. Readers who may wish to see a statement of the case rather from the side of his followers than from that of his critics are referred to the writings of these authors. C. F. D.

CAREY, MATTHEW (father of H. C. CAREY) born in Ireland in 1760, emigrated to United States in 1788 in consequence of political troubles. His career was varied and successful; editor of newspapers and magazines, pamphleteer, publisher, he was till his death in 1840 (at Philadelphia) a prominent figure. He wrote numerous pamphlets, partly political, partly economical. In 1820-40 he was the most active among the advocates of protection in the United States. Among his pamphlets (all published at Philadelphia) may be mentioned:—

Brief Examination of Lord Sheffield's Observations on Commerce of United States, 1791.—*Appeal to Common Sense and Common Justice*, 1822.—*Essays on Political Economy, or the most certain Means of promoting Wealth*, etc. (1822).—*The Crisis*, etc., 1823.—*Examination of the Boston Report*, etc., 1828. F. W. T.

CARLI, GIAN RINALDO, born at Capo d'Istria 1720, died at Milan 1795. In 1744 he became professor of astronomy at Padua. In 1753 he settled at Milan, where he was appointed president of the financial board by the Austrian government.

Between 1751 and 1760 he published his famous work on *Coins and Minting*. (A part of the first volume was published in 1751 in Venice under the title, *Della origine e del commercio della moneta, e della istituzione delle zecche d'Italia*; the whole of the first volume was published at the Hague in 1754 under the title, *Delle monete e dell' istituzione delle zecche d'Italia*; in 1757 he published the second volume at Pisa, and in 1759 the third volume, in two parts, at Lucca.) In 1766 he published at Milan a pamphlet on the deterioration of the coin in Milan, and the rules he gives for amelioration were, later on, the basis of the reform which was effected. Ten years later appeared his report on the "Census of the State of Milan," containing a critical history of methods for valuations of property. In 1770 he wrote a very able refutation of the mercantile theories concerning the wealth of nations as measured by exports and imports (*Breve ragionamento sopra i bilanci economici delle nazioni*), hence it is somewhat surprising to find him writing in 1771 a pamphlet on the corn trade (*Del commercio libero dei grani*) in support of GALIANI, combating his critics, and strongly in favour of governmental regulation of this branch of commerce. Most of

his economical writings have been reprinted in CUSTODI's *Economisti Italiani*, Milan, 1804. Besides being an economist he was a good antiquarian and historical writer. He tarnished his character by his excessive hatred and jealousy of Pietro VERRI, the economist.

M. P.

CARLYLE, THOMAS, born 1795, died 1881. Carlyle conceived that a true political economy should be a political philosophy and tell us "what is meant by our country, and by what causes men are happy, moral, religious, or the contrary" (see *Life* by Froude, vol. ii. p. 78). Economics in a narrower sense was associated by him with BENTHAM and M'CULLOCH ("M'Croudy"), and nicknamed, through a misconception, pointed by the power which paradox sometimes exercised even over his happiest thoughts, the "dismal science." His praises of WORK and THRIFT (*Past and Present*, etc. etc.), his description (from FRANKLIN) of man as a tool-using animal (*Sart. Res.*), and his respect for pioneers who drain fens (see *Cromwell*) or make railroads, like "the rugged BRINDLEY" (*Past and Present*), or reclaim the moors and forests (*Latt. D. P.*, No. 1), even his cardinal principle "know what thou canst work at" (*Sart. Res.*), are the outcome of his character as moral teacher, and point to no special economical bent, though the last no doubt implies the economical principle of division of labour. He is courteous to "national economy" when identified with Old Frederick William (see *Frederick the Great*, bk. iv. ch. iii.), and he even allows that English political economy has had its lesson to teach us (*Latt. D. P.*, No. 1). Even "mammonism" itself "has seized some portion of the message of nature to man; and, seizing that and following it, will seize and appropriate more and more of nature's message" (*Past and Present*). The English people are the wisest in action, and their practical material work is the one thing they have to show for themselves that is true and solid (*Past and Present*). But he has done most service to economics by his criticisms. When *Past and Present* appeared (1843) the *Deutsch-Französische Jahrbücher* of MARX and Engels at once took note of it as the most important book of the day on social questions. Carlyle there showed that extreme LAISSEZ-FAIRE may mean disintegration of society and simple anarchy; it removes old bonds, and leaves men disjoined from each other, except for the "nexus of cash payments." The result is the "nomadic servitude" of the working classes and the destruction of all security and permanence in their conditions of life. In the *Nigger Question* (1849) he allows no advantage to the English labourer over the West Indian slave; the slaves were "hired for life," and the workman are hired by the job. He is on safer ground when he points to the common liability to disease as a wholesome

reminder to the rich of their common humanity with the poor (*Past and Present*), and when he impresses on economists the fact that their ECONOMIC MAN is an abstraction, and the universe is not one huge shop. He derides mere skill in selling cheap (*Bobus of Hounds-ditch*), and even industrial enterprise, so far as it aims at profit-making (Hudson, *Plugson of Undershot*, etc.) But he is firm against corn laws, and against the landowners who "refuse to take the market rate for their onions," and forget that *they* did not make the land of England. He goes farther than most economists in his estimate of "captains of INDUSTRY," and in his view that the relation of MASTER AND SERVANT is eternal (*Nigger Question*). He shows no appreciation of the power of workmen's combinations: and has no sympathy with nations and peoples as distinguished from individuals. On the whole economists have learned more from his protests against abstract Ricardian political economy and its tendency to reduce the state to "anarchy plus the constable" than from any of his positive teachings. His pleadings had their influence even with men like John MILL, who were perfectly aware of their defects of logic. It should be added that the "theory of dependence and protection" criticised by Mill in his chapter on the "Probable Futurity of the Labouring Classes" (*Pol. Econ.* iv. vii. § 1) is essentially that of Carlyle.

J. B.

CAROLUS (English). Gold coin (Charles I.) rated at 20s. Also called a "unit" or "broad." Weight, 140.5 grains. Fineness, 916.6. Value at £3:17:10½ an ounce, £1:2:9½. F. E. A.

CAROLUS DOLLAR. A name sometimes given to the Spanish dollar which circulated for many years throughout America and in China and the East generally, and which bore the effigy of either Carolus III. or IV. of Spain. The coin was also known as a "pillar dollar," a name which it derived from the fact that part of the device on its reverse consisted of two pillars, intended to represent the Pillars of Hercules (the Straits of Gibraltar). Its Spanish name was "peso duro" (or hard dollar). It was also called an "eight piece" on account of its division into 8 reals. (For the dates of issue, weight, and fineness, see DOLLAR, HARD.)

F. E. A.

CARRIER, COMMON. A common carrier is one who plies his trade between certain places and regularly undertakes for a pecuniary consideration to transport the goods of all who choose to employ him. At common law the principal duties of a common carrier are: (1) To carry all things belonging to the description of articles which he publicly professes to carry for any person who is ready to pay him his customary hire, provided he has room for the things in his cart or carriage, or other means of transport. (2) To take proper care of the goods he

carries, and to make safe delivery to the consignee. He is responsible for loss from any cause except negligence of the owner, or from their nature, or from any occurrence independent of man. He is regarded as an insurer of the goods, and cannot by public notice limit his liability. (3) Every carrier of passengers for hire is answerable for the least want of forethought, skill, or care in himself or his servants, arising from the discoverable defectiveness of his conveyance, horses, or equipments. He is not an insurer like the carrier of goods, and is not therefore responsible for latent defects which no skill or care could have detected. The status of a common carrier at common law has been modified by the following statutes. By the Carriers Act 11 Geo. IV. and 1 Will. IV. c. 68 he is not to be liable for the loss of or injury to gold, silver, plated articles, precious stones, jewellery, watches, clocks, trinkets, bills, notes, securities, stamps, maps, writings, pictures, glass, china, silks, furs, or lace if the value exceeds £10, unless the value be declared and an increased charge be demanded and paid. The act does not apply to any loss or injury arising from his own misfeasance or the felonious acts of his servants. By the 29 & 30 Viet. c. 69 he is not bound to receive specially dangerous goods.

[*Chitty on Contracts*, London, 1881.—*Law of Carriers*, W. H. Macnamara, London, 1889.—*Smith's Mercantile Law*.]

J. E. C. M.

CARRYING OVER. On all stock exchanges there are dates for settlements of bargains which it is not convenient for operators to negotiate for ready money. The largest settlements are those which are carried on in the middle and near the end of each month on the London stock exchange. Before the dates of settlement those who have bought securities which they are unwilling to pay for, and those who have sold what they cannot deliver, come to an agreement by which the bargains are "carried over." Carrying over, then, is the process of postponing, by agreement, the date of settlement. If the stock can be easily borrowed in the market, the buyer pays a rate of interest, sometimes called continuation, or CONTANGO, for the privilege of prolonging his bargain till the next settlement. If the stock is scarce, it sometimes happens that a seller, who cannot deliver or borrow his stock, must pay a fine called BACKWARDATION (*q.v.*) to the buyer.

A. E.

CARRYING TRADE. "The carrying trade," says Adam SMITH, "is employed in transacting the commerce of foreign countries, or in carrying the surplus produce of one to another" (*bk. ii. ch. 5*). He remarks that the line of distinction is often not drawn with sufficient clearness between it and the foreign trade of consumption. In a celebrated passage he institutes a comparison between the encouragement and support given to the productive

labour of a country by the wholesale home trade, the foreign trade of consumption, and the carrying trade, greatly to the disadvantage of the last. "That part of the capital of any country which is employed in the carrying trade is altogether withdrawn from supporting the productive labour of that country to support that of some foreign country. Though it may replace by every operation two distinct capitals, yet neither of them belongs to that particular country." The carrier's profits are the only addition it makes to the wealth of the country, except in so far as the part of the capital employed in it, which pays the FREIGHT, puts into motion a certain number of productive labourers. The carrying trade, being carried on with the surplus remaining after the home and foreign trades are provided for, is, in his opinion, "the natural effect and symptom of great national wealth, but does not seem to be the natural cause of it." Holland had still, in his time, the largest share of the carrying trade of Europe, because it was, in proportion to its territory and population, by far the richest country in Europe; England, too, was held to have a large part, but much of it was really a "round-about foreign trade of consumption." Some of Adam Smith's successors have disputed his views respecting the economic nature of the carrying trade, and have maintained that it is a matter of indifference to a nation how a capital is employed so long as the ordinary rate of profit is obtained. But see Prof. Nicholson's Preface to his edition of the *Wealth of Nations*.

There is a tract entitled "Observations touching Trade and Commerce with the Hollanders and other Nations," which is commonly attributed to Sir Walter RALEIGH, and which appears at least to have been laid by him in manuscript before James I. In this a very interesting account is given of the carrying trade of Holland. The origin of it he represents as due to the mismanagement of the Portuguese. The "home-bred commodities" of the Hollanders he represents as insignificant in amount, and "not a timber tree," he says, "grows in their country"; yet "their traffick with the Hans-towns exceeds in shipping all Christendom." They transported the "merchandises of France, Portugal, Spain, Italy, Turkey, East and West Indies, into the east and north-east kingdoms of Pomerland, Spruceland, Poland, Denmark, Sweedland, Leifland and Germany, and the merchandises brought from the last-mentioned kingdoms . . . into the southern and western dominions." Their success he attributes mainly to their judicious and liberal regulations for the encouragement of commerce.

It is commonly believed that the first heavy blow to the Dutch carrying trade was dealt by the English NAVIGATION ACT of 1651, re-enacted, with some modifications, after the Restoration (12 Chas. II. ch. 18). Some have denied

this, but, it would seem, on insufficient grounds. That the Dutch suffered by this legislation can scarcely be doubted, though it may well be questioned whether England gained by it in a commercial sense. Politically, that is to say, in relation to the strength and security of the state, Adam Smith pronounces the acts, though prompted in some degree by national animosity, to have been "as wise as if they had been dictated by the most deliberate wisdom."

J. K. I.

CARTEL. Cartel means, in international law, the terms of agreement between belligerents for the exchange or ransom of prisoners. The "cartel" of chivalry meant first of all the terms of a combat, and then simply the challenge; and the second is still its ordinary meaning on the Continent. By analogy, the word *Kartell* is now often used by German economists to denote a TRUST, i.e. an agreement between rival merchants to limit production or otherwise temper the extremity of competition; so in 1889 it was used of the suspension of hostilities between conservative and liberal parties in view of the common defence of the empire.

J. B.

CARTOGRAM. A cartogram is a representation "in which the geographical map shows the totals or the ratios of the different units by various inserted diagrams and hexagrams" (see GRAPHICAL METHOD).

[Paper by E. Levasseur, "La Statistique Graphique," *Jubilee Volume of the Statistical Society*, London 1885.—*Annals of the American Academy*, Supplement, May 1891, "The History, Theory, and Technique of Statistics," by A. Meitzen.]

CARUCAGE. A tax levied on the carucate, the amount of land cultivated by one full plough team of eight oxen. It has been asserted that the carucage was levied on the plough (caruca), and that a tax levied on the carucate of land was neither a carucage nor so termed by contemporary authorities. That the mention of the carucate was much earlier than that of the carucage can hardly be doubted. Equally surely may it be surmised that contemporaries recognised a tax levied on the carucate as a carucage (Leland, *Coll.* p. 223). The point is one of considerable importance. In the first place were the incidence of the carucage on the plough, not on the soil, valuable information would be furnished as to the steps in the transfer of taxation from "land" to "movables" (cp. SCUTAGE and KNIGHT'S FEE). In the second place the discussion as to carucage has included a close investigation of the circumstances of the tax levied by Richard I. in 1198 towards the payment of his ransom (*Eng. Hist. Rev.* iii. 501, 702; iv. 105). Though this levy has been customarily spoken of as a carucage, there is no doubt that it is not so referred to in documents of the time; there is equally no doubt that it was levied on the

carucate. Indeed, its chief importance in the history of taxation lies in the fact that it was levied after a new and careful survey of the country had been made, whereby the actual ploughland was to be substituted for the nominal HIDE "as the unit of taxation." In this aspect it marks an important stage. The carucate contained four bovates, and has been estimated from Fleta as comprising 160 acres in a two-course, and 180 in a three-course MANOR.

[*Eng. Hist. Rev.*, *op. cit.*; Dowell, *History of Taxation*, vol. i. ch. v.; Madox, *Exchequer*.]

E. C. K. G.

CARY, JOHN (died soon after 1719), an influential Bristol merchant, author of *An Essay on the State of England in Relation to its Trade, its Poor, and its Taxes*, 1695, which LOCKE calls "the best discourse I ever read on that subject," and speaks of "the undoubted evidence of most of it" (Letter to Cary, *Brit. Mus. Addit. MS.* 5540, p. 70). This work was reissued several times, with alterations, and under different titles—*An Essay towards Regulating the Trade and employing the Poor in this Kingdom*, 1717 and 1719; *A Discourse on Trade*, 1745. It was translated into French, 1755, with additions said by M'CULLOCH to be improvements, and retranslated into Italian 1764. Some extracts from Cary's work were published separately, and some tracts originally separate have been bound up with the main work.

The most valuable part of Cary's work is perhaps that which relates to the employment of the poor, for which purpose he proposed a combination between parishes (*Essay sub finem*, appendix to *Discourse*). Correct views on the relation between the quality of coin and the exchanges are found in the tract *On the Coin and Credit of England*, 1696 (see Macleod, *Dictionary*; also *Banking*, vol. i. p. 403). In *An Essay towards Settling a National Credit*, 1696, a national bank is proposed. Other recommendations embody the doctrines of protection and the balance of trade in their most specious forms. BULLION imported "adds to the wealth of the nation" (*Essay*, pp. 2, 116), but not so much as raw material, "the subject matter of a great manufacture." The difficulty of applying these principles is illustrated by Cary's observations on different branches of British trade. He reckons that England loses by the East India trade (see CHILD), and wishes fashion would encourage native woollens rather than Oriental calicoes (*Essay*, pp. 52-65). He would discourage the Irish woollen manufacture in the interest of Ireland as well as England (*ibid.* p. 91). He would encourage the Irish linen manufacture (*Essay*, p. 109, appendix to the *Discourse*) and the export from Ireland both of raw wool and of cattle and other agricultural produce (*ibid.* p. 107). He would "open" the African trade in negroes, "being indeed the best traffick

the kingdom hath, as it doth occasionally give so vast an employment to our people both by sea and land" (*ibid.* p. 75).

Some of these topics are discussed in letters to and from Cary, *Brit. Mus. Addit. MS.* 5540.

F. Y. E.

CASAREGIS, JOSEPHUS LAURENTIUS MARIA DE, born 1670 at Genoa, died 1737 at Florence.

The author of the *Discursus legales de Commercio*, Flor. 1719-29, and of a treatise bearing the title; *Il cambista instruito per ogni modo di fallimenti*, Venezia, 1737.

M. P.

CASE OF NEED. See BILL OF EXCHANGE.

CASH. MONEY: CIRCULATION: CURRENCY. All that may be reckoned as equivalent to money, or the owner can at option obtain possession of in money on demand. Thus coin, bank-notes, postal notes, bankers' balances on current account, and cheques to bearer, may all be reckoned as cash in the country where they are current, their instant convertibility into currency being alone requisite to bring under the designation "cash." It is evident from this that cash and money are words having a very different signification. The money in a country in coin is a determinable quantity; the cash resources of the community are in this country nearly as much greater than the actual money in circulation as the banking deposits are greater than the cash actually held by the banks holding those deposits. It may safely be assumed that all who are possessed of banking accounts hold the bulk of their cash in their bankers' hands, and there are estimates formed, or statistics available, of all these descriptions of cash in the hands of the public. If, therefore, bankers' current accounts, say, half their deposits are included among the "cash" resources of this country the whole may be briefly estimated as:—

Gold in circulation	£70,000,000
Silver "	20,000,000
Bronze "	1,000,000
Postal notes and orders	1,000,000
Banking accounts current	400,000,000
Bankers' notes and drafts at sight	50,000,000

Total cash resources U. K. . . . £542,000,000

This is a rough estimate for the year 1901, the coin in circulation excluding that in bankers' hands, and the banking accounts excluding money at notice. The coin in the banks is excluded from the gold in circulation because it is represented in the accounts current, and cheques outstanding are included in the same item. It is not intended here to enlarge upon the different forms of Cash, for which reference should be made to the articles BANKING; BANK-NOTE; CHEQUES, LAW OF.

CASH (or LI). The lowest denomination of the Chinese money of account; a brass coin; the only coin as yet issued by the Chinese government. Nominally 1000 cash = 1 TAEI (the unit

of value), but in consequence of successive reductions in their weight they are now only received in circulation at from one 1600th to one 1800th of a tael. By a proclamation of the 2d September 1889, however, cash issued from the new Canton mint are ordered to be received at their nominal value, one 1000th of a Tael. The Chinese mints now coin silver, but there is no regular test of assay and weight. F. E. A.

CASH ACCOUNT. A record of current cash receipts and payments, usually kept in a book termed the cash-book. Hence it follows that the difference between the one side of the account and the other exactly represents the cash balance to date, and available for all current purposes. This account is essential for purposes of book-keeping, and in important businesses its total should be made day by day to agree with, and in fact be the same as, the current account at the bank; as of course it will when all receipts are paid into the bank, and payments are made by cheque. The auditor, for instance, who thus has all the receipts and payments for a given period verified by the pass-book, together with the balances owing and receivable at the date of closing the accounts, is at once placed in a position to construct a revenue account for the period under consideration, and possesses a general voucher as to the accuracy of the cash transactions entered.

Some further description of the *cash-book*, however, is necessary. In its simplest form it is ruled for debtor and creditor entries—the first column for the entry of the date; the second for the entry of the description of the receipt on the one side, or payment on the other side; the third for the entry of the ledger folio; and the fourth for the pounds, shillings, and pence received or paid under that particular head. Many cash-books, however, are ruled with a considerable number of cash columns, so as to separate and classify the different items of receipt and payment. For instance, the cash-book of a gas company may contain on the receipt side four columns representing so many collecting districts, a fifth column for cash received for sales of coke, a sixth column for residual products and miscellaneous, and a seventh column for the weekly totals. On the other side there would be six columns recording different descriptions of wages and salaries, coal, buildings, implements, and repairs of mains, and the weekly total; the account thus arranged would be regularly examined by the board, and compared with the corresponding periods of previous years. The cash-book in this instance indicated much more than the simple receipts and payments of money: it indicated the progress made in each district and in all branches of their operations. This is but an illustration of what a properly constructed cash account is made to show.

CASH CREDIT. In Scotch banking, a mode of advancing money by permitting an account current to be regularly operated on and overdrawn up to a certain specified limit. The advances are secured to the bank by two cautioners or securities, and interest is paid on actual overdrafts. In earlier years this method of advancing served largely to develop commercial enterprise in Scotland, but during recent years the country has become richer and the Scotch banks have, since they set up branch offices in London, applied themselves to negotiating bills at current market rates rather than to employing money in cash credits. A. D.

CASH, SALE FOR. On the stock exchange bargains are sometimes done for cash as distinguished from payment and delivery on the succeeding settling day. That for CONSOLS is the only market on the London stock exchange in which a broker, asking for a price, would receive a quotation "for cash." This "consol market" includes Metropolitan Board of Works stocks, Indian sterling stocks, also Colonial inscribed stocks. In other stock markets the quotation would be for purchase or sale on the date of the next settlement. A. E.

CASHIER. In English banks and offices the clerk appointed to take charge of the cash is designated by this title, occasionally by that of "teller." For convenience sake the work is sometimes divided between receiving and paying cashiers. The duties of the office require intelligence, quickness, and firmness, with a pleasant manner of addressing people. The position differs in some banks. The chief officer, the general manager of a bank as he would more usually be termed, is sometimes spoken of as the cashier. In the United States the cashier is spoken of much in the same way. Horton, C. J., has remarked, "The cashier is the executive of the financial department of the bank, and whatever is to be done, either to receive or pass away the funds of the bank for banking purposes, is done by him or under his direction; he therefore directs and represents the bank in the reception and emission of money for banking objects" (Asher v. Sutton, 31 Kan. p. 289, quoted in *American Banker's Magazine*, July 1889). The care and management of the property of the bank, and the conduct of its business in the usual and ordinary way are in these circumstances among the duties of the cashier; their scope is in England restricted usually in the narrower sense.

[J. W. Gilbart's *Practical Treatise on Banking*.—G. Rae's *Country Banker*.—J. Hutchison's *The Practice of Banking*.—The *English Banker's Magazine*, and the *American Banker's Magazine*, *passim*, may be cited.]

CASTE. This word is derived from the Portuguese *casta* "white, pure;" and is used by Europeans as the name of an institution

which they believed themselves to have found in the East Indies. There is no native word exactly corresponding to the idea formed by Europeans; but *jāti* "birth," and *varna* "colour," supply its place. In the oldest records of the Aryan race in India, that is the oldest hymns contained in the Vedas, there is no mention of caste. It is in a celebrated hymn called the *Perrusha Sūkta*, which is in a later appendix to the older ones, that we first find a reference to the four principal divisions of Indian caste:—the Brahmins, the Kshakias or nobles, the Vaishyas or peasantry and traders, and the Shūdras or servants. But caste itself, as an institution, is neither mentioned nor even inferred in the actual words of the poem, which may be dated approximately at about 800 B.C. In a passage repeated in both recensions of the *Gajur Veda* we have a long list of seven hundred and sixty divisions into which the people of India were then divided. It is very interesting as containing many names (partly of trades, partly of tribes) which afterwards became caste-names. But that it is not a list of castes is clear from the fact that it includes also a number of such divisions as thief, back-biter, dwarf, leper, red-eyed man, barren woman, and so on—a classification quite independent of the idea of caste. From that time onwards each later Hindu book shows a marked growth of the development of caste feeling, until in the law book of the *Mānavas*, also called the *Laws of Manu*, which may have reached its present shape about a century before our era, we find the institution of caste, as at present understood, in full vitality. Important privileges are accorded to men of the higher castes; crimes are punished, not only according to the nature of the crime, but according to the caste of the criminal;—it may be inferred, though it is nowhere actually stated, that occupations are usually hereditary and dependent upon caste;—caste is lost by eating or drinking, and of course by sexual intercourse with the lower castes; marriage is restricted by the distinctions of caste; and to lose caste altogether, to become an "outcaste," has become almost the greatest of disasters. On looking more carefully, however, into the castes mentioned in *Manu*, sixty in number, we find them to be mostly different not only from the castes now actually existing, but also from the quasi-caste names in the early list of divisions of the people mentioned above, and in other similar lists found in the *Milindu* and in the *Rāmāyana* (which are somewhat later than *Manu*). This is to be explained by the fact that the caste divisions of the many peoples in the great continent of India have, from the first, been constantly though slowly changing. The institution has remained, and remained with similar restrictions. But the lines of the division have varied. The history of each caste

requires, indeed, to be separately examined; and examined from each of its various sides—as a trade guild, as a racial division, as a circle within which marriage is permitted, as a community with legal powers over its own members, even as a religious sect. The commonly-received notion of "The immovable East" is due simply to the ignorance of Western writers. And there is no better example of the mistakes into which that idea may lead us than the conception of an iron system of caste whose bounds none may pass over. When the Dutch began cinnamon planting in Ceylon they were in need of labourers, "coolies" as they are called, "men working for hire." A peasant in India looks upon the labourer for hire as a disgrace. Those, of whatever caste, whose necessities drove them to accept the terms offered, were looked down upon. And so rapid was the effect of this feeling that in a couple of generations an entirely new caste was formed, that of the "cinnamon-pealers." For nearly a century the trade flourished, and their numbers increased. For the last seventy years the trade has steadily diminished. But the caste, the members of which are now engaged for the most part in other occupations, remained. Throughout its short but most instructive history it had never been (as the majority of the castes have been) identical with a division of race. For some generations it had fulfilled many of the functions of a trade guild and of a trades union, functions now only feebly surviving. But it is still in full vitality as a restriction on marriage, and as an index of social position. This instance has been chosen because all the facts are ascertainable from the official documents of European administrators. But a comparison of the lists referred to above, and of lists of the different castes now existing in different parts of India, show that it is only a sample of many changes that have occurred in the caste-system of that continent. There are about one hundred and fifty castes to-day in the Bombay Presidency. No one has yet attempted to write their history. It is probable that most of them are, as castes, of comparatively recent origin, and each one of the one hundred and fifty must be considered apart from the others in order to ascertain the vitality of its caste powers and feelings in respect of race, of religion, of trade, and of family ties. There are numerous instances in the books of transition of an individual from one caste to another. It is quite common for a man of one caste to follow the occupation usually assigned to another. And there are, on the other hand, trade guilds independent of caste; and castes within castes, so far as marriage is concerned. Even among the Brahmins, very few can trace their descent from pure Brahmins. They are split up into innumerable exogamous *gotras* or families, some of which are not Brahmins at all by descent.

And they follow every imaginable sort of occupation except only those assigned to certain of the lower castes. Certain Beldars, for instance, excavated as navvies the now sacred lake of Pushkara or Pokhar in Marwar. Their descendants rank as Brahmins, have raised the pick-axe into an object of worship, and are found to the number of twenty or thirty thousand, throughout Rajputana and Sind, as a special *gotra* called the Pokhar Brahmins. Each of the constantly recurring religious movements in India has had a profound influence on caste. Many of the greatest leaders, from Gotama the Buddha downwards, have commenced by protesting against caste distinctions, and entirely abolishing them within the inner circle of their more ardent followers. Caste among the laymen of the new communities was for the most part left undisturbed. But, though in different degrees, the new religious communities became themselves the source of new caste divisions, and people of the same caste, but of different religions, ceased to intermarry. It will be seen that the subject of caste in India is one of very great complexity. Dr. Wilson of Bombay had intended to undertake the gigantic task of bringing order into the chaos of our knowledge of the subject. He died when the work, though he had laboured at it for years, was really only begun. There were published, however, two volumes entitled *Indian Caste* (Blackwood and Sons, London and Edinburgh, 1877, pp. 450 and 228) in the first of which he has collected together all the references to caste he could find in Hindu literature from the Vedic times downwards; and in the second of which he attempts to trace in detail the history and the present occupations of one caste only, that of the Brahmins, in all its numerous details. Even that is confessedly imperfect; and there is no other work in which even an attempt has been made to explain either the past history or the present position of any of the other castes. Various details as to the numbers of the different castes, not in India as a whole, but in particular districts, can be found in the local Gazetteers and Census reports of the Indian Government. But they have not yet been properly summarised or analysed. It would be undesirable, in the present state of our ignorance of the subject, to attempt to form any estimate of the economic influence of the caste system. It is doubtful to the writer whether it has really had any practical effect in restraint of trade. But the few words here devoted to the subject may remove some misconceptions, and the numerous authorities quoted by Dr. Wilson will assist those who wish to investigate the problem further.

T. W. E. D.

CASUEL. A general term in France for a revenue which was not fixed, but proportioned to the performance of work. It was specially

applied to the fees charged by the clergy for baptism, marriage, burial, and the other sacraments of the Roman Catholic church. R. L.

CASUS. An expression used by Roman lawyers to express events which could not have been avoided by the strictest amount of diligence required by the law in ordinary cases. The expression does not quite correspond with the English "Act of God," which is the equivalent of the Roman *vis major*, and includes those events only which could not by any amount of care have been foreseen or controlled under the special circumstances.

E. S.

CATALLACTICS, or the Science of Exchanges, is a name proposed by Archbishop WHATELY as conveying a much better idea of the nature of economic science than is conveyed by the name political economy. Other writers, e.g. Mr. H. D. Macleod, have also regarded the exchange of wealth as constituting *par excellence* the subject-matter of the science. More generally, however, it is held that while the laws of exchange occupy a fundamentally important place in economics, the science is equally concerned with the laws of the PRODUCTION, DISTRIBUTION, and CONSUMPTION OF WEALTH.

A *Catallactic* community has been defined as one in which individuals freely exchange commodities one with another, each with a view to making the enjoyment he derives from his possessions a maximum.

[An anonymous treatise was published in London, 1842, entitled *Letters on the rudiments of a Science called Catallactics.* J. N. K.]

CATASTO. Taxation in mediæval Florence was an important political weapon, because it was based upon an arbitrary assessment of real and personal property. Thus the party in power could ruin its political opponents by excessive taxation. In 1427, when the oligarchical party had the upper hand under Rinaldo degli Albizzi and Nicolo da Uzzano, the opposition, headed by Giovanni de MEDICI, endeavoured to reform this abuse by securing the adoption of the *catasto*. The object of this reform was to obtain a careful and impartial registration of property, so that the incidence of taxation should depend upon wealth alone, and not upon political opinion. Every citizen was to make a return to the gonfalonier of his district of his whole income, from whatever source. His income from capital, whether fixed or circulating, was to be reckoned at 7 per cent. If a man concealed anything the penalty was confiscation. These returns were to be collected into four books, one for each quarter of the city. The assessment of taxes, which was to be strictly based upon the record of these books, was entrusted to a commission of ten, who were elected out of sixty citizens chosen by lot. A new *catasto* was to be made every three years.

This admirable reform was abrogated by

Cosimo de Medici, the son of Giovanni, to whom Machiavelli ascribes the chief credit of the change. Cosimo, who overthrew the oligarchy in 1434, and laid the foundation of the Medici dynasty, returned to the system of arbitrary assessment. It was said of him that he used the taxes as the northern despots used the dagger. His object, however, was not only to ruin his opponents, but also to conciliate the lower classes by diminishing the burden of taxation upon them and throwing it upon the rich.

[Machiavelli, *History of Florence*, bk. iv. ch. iii. Gino Capponi, *Storia della Repubblica di Firenze*, libro iv. cap. vii.] R. L.

CATTANEO, CARLO, born 1801 in Milan. He wrote frequently in the *Annali Universali di Statistica* and in the *Politecnico*. He distinguished himself in the defence of Milan in 1848, against the Austrians, but was a federalist, opposing the union of Lombardy with Piedmont. He was elected three times a deputy, but never sat in Parliament, because, as a republican, he refused to take the oath. He died in 1869 at Castagnola, close to Lugano. His works are as yet only partially published. His principal subject was land tenure. Besides his economical writings, in which he shows himself a decided opponent of List and his system, he wrote historical and literary compositions of value.

Among his writings are the following: *Notizie naturali della Lombardia*, Milano, 1844.—*Storia della rivoluzione del 48*, Lugano, tipogr. Svizzera, 1849.—*Ugo Foscolo e l'Italia*, Milano, 1861.—*Della pena di morte*, Milano, 1860.—*Alcuni scritti*, Milano, 1846-47, vol. iii.—*Borroni e Scotti*.—*L'Italia armata*, Milano, 1861. M. P.

CATTLE PLAGUE ORDERS. By the 41 & 42 Vict. c. 74, 47 & 48 Vict. cc. 13, 43, 47, and 49 & 50 Vict. c. 32, very extensive powers are given to the privy council for the prevention of contagious diseases amongst animals. These powers are exercised by means of "orders" issued when necessary. The privy council may declare what places are infected areas, and regulate the destruction or movement of animals in or out of such area: it may make orders relative to dairies, cowsheds, and milkshops; and may prohibit or regulate the importation, slaughter or quarantine of animals coming from foreign countries. J. E. C. M.

CAUTION (Scots Law Term). In Scotland the law has been very largely assimilated to that of England. No consideration need be proved, and the period of limitation is seven years from the date of the bond of caution, at the end of which time the surety, if known to the creditor to be a surety and not a principal, becomes free, unless the creditor shall then have begun execution proceedings against him. When sureties become bound by way of collateral security, each for the performance of the whole of an obliga-

tion, the Scottish rule is that the creditor can rank for the whole upon the estate of each, but not so as to do more than draw full payment of the debt.

[Bell's *Commentaries on the Law of Scotland*, ii. 416.] A. D.

CAUTION. Security given in the course of judicial proceedings. The word is not used in England except in the practice of the ecclesiastical courts; in Scotland it is a regular term of art used in acts of parliament and legal documents. In the French language the word caution is equivalent to the English GUARANTEE, and is used to express the security as well as the person acting as surety.

[*Fournir caution de payer les frais*, Code de Procédure civile, § 166.—*La solvabilité d'une caution*, Code civil, § 2019.] E. S.

CAVEAT. An expression used in the procedure of the probate, divorce, and admiralty Division of the High Court. A person wishing to dispute the validity of a will, by entering a "caveat" compels the executors to bring an action to obtain probate. In admiralty proceedings a person can prevent the arrest of his ship or cargo by entering a "caveat," if at the same time he undertakes to appear in the action and give security in accordance with the rules of court. E. S.

CAVEAT EMPTOR. A maxim of the common law applicable to sales of personal property as regards the quality of the things sold. The buyer (in the absence of fraud) purchases at his own risk unless the seller has given an express warranty or unless a warranty be implied from the nature and circumstances of the sale. The rule does not, however, apply if the buyer has had no opportunity of inspecting the article bought. Hence, where a chattel is to be made or supplied to the order of the purchaser, or where it is sold by description or by sample, or for a particular purpose, the law implies a WARRANTY.

[*The Sale of Personal Property*, by J. P. Benjamin, Q.C. 4th ed. London, 1888.]

J. E. C. M.

CAVOUR, COUNT CAMILLO BENSO DI (1810-1861), can be considered in this place only as an economist. His career as a statesman lies outside our boundaries. A few biographical remarks will, however, not be out of place. Cavour, like the sons of all the Piedmontese nobility, was placed in the military academy as soon as of age to be received there. He left this school at eighteen as a lieutenant in the Engineers, and was sent to work at the fortifications of Genoa. He had a particular talent for mathematics, and one of his teachers, the well-known Plana, desired him to devote himself to pure mathematics, telling him he would rival LAGRANGE. Cavour's answer, eminently characteristic of the man, is preserved in his correspondence: it is to the effect "that

mathematics are not the thing required just now, but economics." Much later (14th December 1849) Cavour wrote in the *Risorgimento*, "The greatest problems our time is called upon to solve are not political ones, but social ones; questions relative to the forms of governments are quite secondary, compared with those reflecting the economic position of society." Cavour left the army in 1831, after having been punished for speaking out too freely on political matters. This misadventure turned out to be his good fortune; it caused him to travel in Switzerland, France, and England, where he remained several years and formed himself as an economist. He is in this respect a disciple of CHERBULEZ, of P. ROSSI, and of what is now called the CLASSICAL SCHOOL. His writings and his speeches abound with quotations from RICARDO, and he wrote an essay in defence of MALTHUS. In one of his first writings, *On the State of Ireland*, he speaks of England in the following terms: "From St. Petersburg to Madrid, in Germany and in Italy, the enemies of progress and the friends of revolution alike consider England as their greatest obstacle. The one set regards England as the hearth upon which all revolutionary flames are kindled, the refuge and citadel of all the subversionists. The other, perhaps more truly, considers the English aristocracy as the central pivot of the European social system and as the greatest obstacle their democratic tendencies meet with. This hatred which England meets with from all extreme parties ought to endear that country to the intermediate ones, to all men who wish for the moderate progress, and for the gradual and regular evolution of humanity, i.e. to all men who from principle are opposed alike to all violent tempests and to stagnation in social affairs. But this is not the case. The motives which might lead them to sympathise with England are counteracted by an enormous mass of prejudice, old tales, and old passions, whose force is nearly irresistible. Therefore there are but few men, scattered here and there and solitary, who feel for the English Nation that esteem and that regard which ought to be inspired by one of the greatest nations which has distinguished mankind,—a nation which has effectively co-operated in the moral and material development of the world, and whose mission of civilisation is very far from being at an end." Cavour's admiration for England and English thought was a subject for which he was often attacked. But he had been trained from his youth upwards to stand fearlessly isolated by his opinions from his countrymen and to face their opposition. His family circumstances were at first a formidable obstacle to his rising rapidly to the front. His father was that would now be called the chief of the police, and as such had many a disagreeable duty to perform. The nobility, to the very

highest ranks of which Cavour belonged by birth, looked down upon him as the son of the councillor of an unpopular king, and of a man who exercised a somewhat despised calling; by the middle classes he was, if not hated, certainly received very coldly for the same reason. Besides this, his independence of thought, which led him not to agree either with the aristocratic or the democratic party, put him for a long time between two fires, with no friends to back him. And in parliament, when he first entered it, the fact that he did not stick to any party, and sometimes supported the government and sometimes the opposition, was at first harshly judged, and only appreciated when people came to understand that Cavour was a new leader, with a programme of his own. As a minister he continually showed unusual courage in expressing, without any regard for the prejudices of his audience, his scientific convictions on economic questions, he even ventured to explain in the chamber economic theories—rebuking those who affected to despise theory. As an example of the high tone of parliamentary discussions under his leadership, and of his sincere respect for science, not concealed from an assembly which, also in those times, often declared economical laws good for some other planet than our own, the following passage of a speech of his, made in defence of the treaty of commerce with France (8th April 1852), and in answer to Menabrea's attacks, may be quoted. Cavour spoke French on this occasion, as on several others, so as to be clearly understood by the Savoyards. The law would even now permit the use of French in the Italian parliament. The quotations from the speech which follows is therefore given in French; the reader will bear in mind that Savoyards, though fluent in that language, do not speak perfect French. "Et d'abord, messieurs, il est facile de démontrer mathématiquement, qu'une fois les principes du libre échange établis, si on veut procéder par degrés dans leur application, en suivant une marche rationnelle et logique, on devrait les appliquer d'abord aux produits de l'agriculture avant de les appliquer à ce qui a rapport à l'industrie manufacturière. Malheureusement, pour faire cette démonstration, je serai obligé de recourir pendant quelques instants aux lumières de la théorie. J'en demande bien pardon à M. Menabrea, mais je ne puis m'empêcher de lui manifester l'étonnement que j'ai éprouvé, voyant un homme aussi savant que lui, un membre de l'Académie des Sciences, manifester un si superbe dédain pour les théories, et surtout pour la théorie de l'économie politique qui a tant d'affinité avec celles des sciences exactes, qu'il possède si bien et qu'il professe d'une manière si distinguée. Car, messieurs, le système protecteur a des conséquences bien plus funestes lorsqu'il est appliqué aux produits

du sol, que lorsqu'il est appliqué aux produits de l'industrie. Le système protecteur appliqué à l'industrie n'a qu'un seul effet fâcheux, celui de détourner les capitaux et le travail national des industries naturelles pour les pousser vers des industries factices, où les capitaux et le travail trouvent un emploi moins productif. C'est là un inconvénient grave sans doute, mais qui est restreint à cette quantité de capitaux et de travail qui par l'effet de la protection sont détournés de leur voie naturelle. Et encore cet effet est-il atténué par la concurrence intérieure qui, au bout d'un certain temps, ramène le taux des capitaux et celui de la main d'œuvre des industries privilégiées au niveau des profits et des salaires des industries qui ne le sont pas. Mais le système protecteur appliqué à la culture du sol a des effets bien plus étendus, et, je n'hésite pas à le dire, bien plus funestes. En effet, lorsque par la suite d'un droit protecteur, vous élevez le prix des produits du sol, le prix du vin et du blé, par exemple, qu'est-ce qu'il arrive ? Il arrive deux choses : en premier lieu certains terrains qui n'étaient pas assez fertiles pour produire du blé ou du vin dans les conditions antérieures du marché, sont mis en culture, ou bien encore, on consacre à la terre des capitaux et du travail qui n'aurait pas été productifs si le prix n'avait pas varié. Cette première conséquence du système protecteur appliqué à l'agriculture est analogue à celle que j'ai signalée lorsqu'il a pour objet l'industrie manufacturière. C'est-à-dire qu'il y a une certaine masse de capitaux et de travail, qui reçoivent une destination moins productive qu'ils n'auraient reçus si les choses avaient été abandonnées à leur courant naturel. C'est là un inconvénient grave qui cependant n'aurait pas une grande portée, si l'élévation des prix des produits du sol n'avait d'effet que sur les produits des terrains nouvellement mis en culture ou des capitaux et du travail additionnels consacrés à l'exploitation des terrains depuis longtemps défrichés. Mais l'élévation factice des prix s'étend aux produits de tous les terrains, à ceux d'ancienne aussi bien qu'à ceux de nouvelle culture. Qui est-ce qui profite de cette élévation ? Lorsqu'elle a lieu elle se partage entre les propriétaires et les fermiers, surtout si ceux-ci sont en possession de long baux : après quelque temps, le profit se concentre tout entier entre les mains des propriétaires. Ainsi donc, le système protecteur appliqué aux produits du sol a pour effet, d'une part, de pousser ainsi que le fait le système protecteur industriel des capitaux et du travail, dans une voie peu productive, et de l'autre d'augmenter la rente des terrains précédemment cultivés aux dépens des consommateurs. Ce qui en définitive constitue un véritable impôt supporté par les consommateurs au profit des propriétaires. . . ."

Cavour also ventured occasionally to give parliamentary discussions an academical tone, quoting economic authority, as in the following

instance: "It is my opinion, in accordance with that of all the most enlightened people in England, and not alone with the men of the present generation, but with the economists who have preceded the present generation, with A. SMITH and Ricardo and his followers, that England has prospered, not in virtue of the protective system, but notwithstanding this system. . . . If you examine English industries you will see that those which have been least protected are precisely those which have succeeded best. . . . The progress of English industry has always been in an opposite ratio to the degree of protection it received. The silk industry (strongly protected) remained nearly stationary; the woollen industry progressed slowly, and the cotton industry, which was hardly at all protected, grew gigantically. I therefore maintain that protection in England not only has failed to aid the increase of wealth, but has even been a hindrance to it." Thus he explained to the chamber the economic principles as to the basis of wages:—"Le taux des salaires, selon les principes non contestés de la science, se règle par la masse des capitaux destinés à payer les salaires, c'est-à-dire par la quantité de denrées de première nécessité à l'usage des classes ouvrières que possède la nation, comparée avec le nombre des bras qui cherchent de l'emploi." He further argued that PROTECTION cannot augment capital, and therefore does not raise wages. All that Protection can do, he said, is to cause CAPITAL to "flow rather in one channel of industry than in another. . . . And it does this by driving them (capital and labour) into the less remunerative branches of industry." The best example, however, perhaps which can be given of his scientific spirit in discussing practical problems in parliament is his definition of the individualist and of the socialist policy. "For reaching this goal (the amelioration of the economic condition of the lower classes) two ways are open for us. All the systems supported in modern times by the wisest and by the boldest men can be classified under two heads. The one school relies on the principle of liberty, on the principle of competition, on the free development of the morals and intelligence of men. Those who hold this opinion think that the larger the application of this principle is, the greater will be the welfare of all, but particularly of the lower classes. This is the school of economists, these are the principles held by the men who are in office, in England. Another school professes principles diametrically opposed to these. It believes that human misery cannot be alleviated, and that the condition of the lower classes cannot be ameliorated, unless individual action is limited, and the central action of the whole social body, represented by a government which has still to be created, is made more powerful, and concentrates all individual forces into itself.

This is the socialist school. Now, no illusions must be indulged in: although this school reaches fatal and sometimes even atrocious conclusions, it cannot be denied that there is something in its principles which captivates many generous and elevated minds. And the only way to combat this school, which threatens to invade all Europe, is to oppose principles to principles. In economics as in politics, as in religion, ideas can only be fought by other ideas, and principles by other principles; forcible repression is useless. For a short time guns and bayonets may repress theories and maintain order; but if these theories find entrance with the intellectual class, you may be sure that they will thrive and triumph. Now, I say that the strongest ally of socialism is protection. Both start from the same base. . . . Given the protectionist system, logic will compel you to admit, if not all, a great many of the doctrines of SOCIALISM."

When Cavour defended FREE-TRADE he gave in just as little to absolute protectionists as to fair-traders; he explained on more than one occasion that if a foreign country commits the error of protecting its own industries, this is no reason for making the same error ourselves. Again, he argues with great acuteness "that if a nation has to undergo great sacrifices and to bear heavy taxation, it must be left the more unfettered in its commercial and industrial activity, so as to bear the weight easier." The best protection, he repeatedly declares, is the maximum of liberty. "It is my opinion that those elements of production and of prosperity which we possess, ought to be left to develop themselves unfettered; that neither agriculture, industry, nor commerce ought to be protected. I believe firmly that the greatest encouragement is to be had from the greatest possible amount of liberty: 'che il massimo degli incoraggiamenti sia il massimo della possibile libertà.'" This speech of his marks distinctly Cavour's position as an economist.

The success of Cavour's speeches in a parliament in which even men of the greatest merit ignored the most elementary truths of political economy, was due to his unmatched knowledge of commercial and technical details. This enabled him to give each man the right *argumentum ad hominem* which would bring home to him the theory under discussion. He was himself a practical agriculturist, and a very successful one into the bargain. This gave him a high authority with all those deputies who were also landlords and knew he could beat them in any practical question. And he liked to quote, on the right occasion, instances of personal experience in agricultural matters. To his mind, highly speculative as it was, sophistry and legal casuistry were completely alien; he would appeal to historical facts, recent and ancient, and generalise skillfully on them; he would show the interests of different parties, explain their actions by their motives; but he would not stoop to play

with the sense of words and base political action on some legal nicety—a method of reasoning very frequent in Latin countries, in which parliaments are largely composed of lawyers. Naturally he was the object of much sarcasm. At one time he was called "Lord Camillo," and from the name of the journal which he had founded and was directing "My Lord Risorgimento," to ridicule his Anglo-mania. *Risorgimento* means resurrection, and is here used in the sense of political resurrection or revival. Cavour was no orator, he had always to win his way by the weight of the matter of his speeches. His voice was disagreeable, his tone harsh, and he had some difficulty in finding the proper words rapidly. But he was first-rate in reply and at making a good pun, and was seldom worsted in debate. When Cavour was not allowed to answer an opponent in the Chamber, because his turn to speak was past, he employed MIRABEAU'S system, publishing the same evening or the next morning his answer in the "Risorgimento." This journal is therefore one of the great sources of information concerning his economic and political views, together with the collection of his speeches (eleven volumes published by Botta at the expense of the government), his correspondence (five volumes edited by Chiala and published by Roux, Turin, 1881-86), and his *Ouvrages politiques et économiques* (published in 1885 by Galimberti, Coni). His best known economical pamphlets are:—the memoir already quoted, *Sur l'état actuel de l'Irlande et sur son avenir*.—*Des idées communistes et des moyens d'en combattre le développement*.—*Des chemins de fer en Italie*.—He wrote *Sur l'influence de la politique commerciale de l'Angleterre dans le monde économique* (in the Review l'Antologia), and a pamphlet on Prof. Ferrara's inaugural address on Political Economy. As an economist Cavour contributed nothing to the theory of the science. He is rather one of those who are well acquainted with the state of science in their time, and utilise it for practical purposes. His opinions in economic matters may be summed up as those of the MANCHESTER SCHOOL, as the Germans qualify ORTHODOX political economy (*Manchesterthum*) when it is accompanied with an optimistic view of the effects of natural laws, and reduced to the basis of absolute LAISSEZ-FAIRE and LAISSEZ-PASSER.

CAYLEY, EDWARD, author of the tract, *Corn trade, Wages, and Rent*, 1826; a plea for protection backed by some curious statistics (see pp. 8, 16, 31).

F. Y. E.

CEDULA. A Spanish word, used on the London stock exchange, chiefly to describe certain guaranteed bonds issued by Argentine banks, corresponding to loans made by these banks against land to proprietors in various Argentine provinces. The word originally meant something ceded, and has reference probably to the land or property which has been ceded as security for the advances made by the Argentine banks.

A. E.

CENS. The French term for a QUIT-RENT; but it has a special meaning in the history of France. DE TOCQUEVILLE has shown the error

of supposing that SERFDOM survived in France until the Revolution. Most of the French peasants in the 18th century held their lands, either as proprietors or as METAYER tenants. In the former case, however, the lord still retained the *cens*, or quit-rent, as a symbol that he retained the ownership, though he had parted with the property of the soil. The *cens* was almost invariably a fixed sum, arranged at the time of the original bargain, and had become insignificant in the 18th century, owing to the decline in the value of money. For this the lord was, to some extent, compensated by the *droit de lods et ventes*, by which, every time the land changed hands, the lord was entitled to a share in the purchase-money, usually a twelfth, but sometimes as much as a fourth.

[De Tocqueville, *France before the Revolution* (London, 1873), note lxxvii.] R. L.

CENSUS may be defined as an enumeration of the persons in a country, and in each of its principal classes: such as those constituted by sex, age, occupation, and so forth. An enumeration of houses and other property is often included. The institution is very ancient. Its existence is evidenced by several passages in the Old Testament (Exodus xii. 37; Numbers i. xxvi.; and 2 Samuel xxiv.; 1 Chronicles xii. 23, xxi. 2-3, xxiii. 3-5; Esdras ii. viii.; Nehemiah vii. ix.) The ancient Egyptians and the ancient Persians were not without a sort of census (*Herodotus*, bk. ii. ch. cxix. clxxvii.; bk. iii. ch. lxxxix.-xc.) In Greece there were enumerations of the citizens for political purposes. In Rome the census was instituted in the age of the kings, and formed an important branch of administration down to the age of the emperors. It is recorded that Augustus wrote out with his own hand a *Breviarium totius imperii*, containing the number of citizens and allies in arms, the statistics of the fleets and provinces, and even the names of freedmen and slaves. The care of Augustus was imitated by his successors. In the ages which followed the fall of the Roman empire the most remarkable compilations of the nature of a census were the *Breviary* of Charlemagne and the DOOMSDAY BOOK of William the Conqueror.

A more detailed notice of the census in modern times may be arranged under the following three heads: (1) The United Kingdom; (2) The Continent of Europe; (3) The United States of America.

(1) The first census in England was in 1801. An abortive attempt to introduce a census had been made in 1753, when Thomas Potter introduced a bill for taking and registering an annual account of the total number of marriages, births, and deaths. The bill was violently opposed. Mr. Thornton, who spoke against it frequently, said: "I did not believe that there was any set of men, or indeed any individual of

the human species, so presumptuous and so abandoned as to make the proposal which we have just heard." The bill, carried in the House of Commons, was thrown out by the Lords. In 1801 there was no opposition. The fear of exposing the paucity of our numbers had given place to a dread of over-population. Mr. C. ABBOT (*q.v.*), in introducing the Population Bill, said: "In times like these, when the subsistence of the people is in question, it is surely important to know the extent of the demand for which we are to supply."

It might have been expected that the new machinery would not work well the first time. But Mr. Rickman, one of the clerks of the House of Commons, the able superintendent of the operation, argues—in the reports accompanying the second and third censuses—that the return of the population is fairly accurate. The overseers of the poor, whose agency was employed, had good opportunities for ascertaining, and no motive for misrepresenting, the numbers. Errors in particular parishes would compensate each other in the aggregate. We may therefore accept a statement which, compared with the enumeration of 1881, shows that the population of England and Wales almost trebled itself during the first eighty years of this century. Equal success did not attend another department of the first census. It was attempted to group the population by occupations into three classes: agriculture, trade, etc., and a residual class of others. But it was left uncertain whether the householder should speak for himself or his family. The want of uniformity in this respect rendered these returns almost useless. The statistics of the present were not the only object of the first census. It was attempted to reason backwards to the numbers of the population in the preceding century by means of entries in the parish registers—an attempt which had been initiated by GRAUNT in his *Bills of Mortality*, 1661, and sanctioned by LAPLACE in his *Théorie des Probabilités* (bk. ii. ch. vii.) The baptisms, marriages, and burials were obtained for several years of last century. Then, as the number of entries in 1801 is to the (enumerated) population in 1801, so is the number of entries in any assigned year of the eighteenth century to the population of that year. Of the three kinds of record the marriages are the best for the purpose of this reasoning. Especially after the marriage act of 1754 there is reason to think that the registry of marriages is pretty complete. As Mr. Rickman puts it, "The solicitude of the female and her family, aided by the precision and severity of the marriage act" precluded omissions. Accordingly the reasoning may pretty safely be carried back as far as that date. As we go farther back there is danger that the reasoning may be falsified by a continual increase in the number of omitted entries. But Mr. Rickman's statistics

appear to establish that the danger is not fatal for recent periods (see Census 1821, Preliminary Observations, p. xxviii.) Altogether the retrospective census seems to establish certain broad statements, as that the population of England increased by about 45 per cent in the latter half of the eighteenth century, and that in the former half of the century the advance was much slower, and retarded by occasional retrogression (see Census 1821, Preliminary Observations, p. xxix.; 1831, Preface, p. xlv. and 1851, Report, p. lxviii.)

The second census took place in 1811. The growth of the population during the decade 1801-11 was rather more than 14 per cent; a rate of increase to which we have now returned, after exceeding it for one generation (1811-41) and falling short of it for another (1841-71). The mistake which had marred the first census was avoided in the second by counting the *families*, not the *persons*, in each of the three classes—agricultural, trade etc., and others. In 1821 questions as to age were first put. But it was left optional, both to the returning officer to ask the question and to the citizen to answer. The returns were fuller than might have been expected, eight-ninths of the total population enumerated. In 1831 the only return relating to age was the number of males aged twenty and upwards. In this year a more elaborate classification of occupations was introduced. One of the principal classes, trade, was subdivided into a hundred specifications. Into the compartments thus prepared the statistical matter did not flow very freely. Accordingly at the census of 1841 each individual was left free to declare his own occupation. The returns were made for the individual, not for the family, as previously. The inquiry as to age was again introduced in 1841 and made obligatory. This census had the benefit of the newly created registration office which supplanted the antiquated machinery of the parish registers. At the census of 1851 and on the two succeeding occasions, the advantage of Dr. FARR's collaboration was felt. The reports embody many of his valuable contributions to vital statistics. His scientific work is enriched with a vein of philosophical speculation and a wealth of literature, which do not often adorn parliamentary papers. To Dr. Farr is due the sixfold classification of occupations which is perhaps destined to be permanent—the professional, domestic, commercial, agricultural, industrial, and the unoccupied class. The grounds of this division are set forth by Dr. Farr in a note appended to the report for 1861. A special feature in the census for 1851 was an attempt to ascertain the extent of church accommodation and the size of congregations for the different religious denominations. In the same year conjugal condition was first made an object of inquiry. In 1861 there was a return of the number of houses containing one, two,

or any assigned number of inhabitants, for twenty-four selected districts. In 1871 the first imperial census was taken.

The history of the census for England and Wales is nearly coincident with that of Scotland down to 1861, when a separate census for Scotland was first taken. A peculiar difficulty attending the Scotch census is caused by the definition of a house which the imperial authorities have adopted: "a distinct building, separate from others by party walls." This definition has been far from "distinct" to the provincial mind. A whole block of buildings have often been returned as a house. The statistics of the number of rooms to a family are more valuable. There are many contrasts between the results of the census in North and South Britain—for instance, the much greater preponderance of the female sex in Scotland—which cannot be adequately treated here.

The history of the Irish census deserves a separate notice. From the age of PERTY to the beginning of the present century estimates of the population, based mostly on HEARTH-MONEY, were attempted. If this method may be trusted, there were in Ireland at the end of the 18th century from four to five million persons; that is about half the contemporary population of England and Wales. A census was instituted in 1812. But it was not successful, having been taken in different years and for partial districts. The Irish census of 1821 was more satisfactory. Its result, in round numbers 6,802,000, compared with the contemporary population of England and Wales, 12,000,000, shows a relation very different from that which now prevails; the proportion of the Irish population to that of England and Wales being in 1821 about a half, in 1891 about a sixth. In 1831 and 1841 returns as to occupations were obtained on much the same lines as in England. But the answers were worked up into different *summa genera*. Families are divided into those who live by (1) capital in wealth or in professional knowledge; (2) the direction of labour; (3) manual labour. The somewhat indefinite second class comprised 50 per cent of the families in 1841. The difficulties of obtaining occupational statistics are illustrated by the incident that in the whole of Dublin only five coffin-makers were returned, whereas in a single street it was ascertained that there were twelve persons so occupied. Only one person in the Irish capital designated himself as an author! Great difficulties attended the preparation of vital statistics in Ireland. The number of births in any year used to be inferred by adding the numbers alive at each year of age to the numbers whose ages at death proved them to have been born in the year under consideration (Report for 1841, p. xl.) There is a large deficiency due to EMIGRATION and imperfect returns of deaths. Still it is interesting to observe with what

accuracy the well-known proportion of male and female births comes out in the aggregates. The commissioners for 1841 claim to have made some contribution to the theory of that remarkable phenomenon. In the census of 1851 a gloomy feature was the decrease of population by almost 20 per cent, due to the famine of 1847. A decrease of 29 per cent is recorded for directors of labour, the second of the three-fold division of occupations above mentioned. The decrease of population which set in at this period has continued ever since; the rate of decrease continually diminishing down to the last decade; when, as shown by the Preliminary Report for 1891, the decrease sprung from 4.4 per cent in the decade 1871-1881 to 9.1 per cent. Much the same distribution as in 1841 is presented by another classification of occupied persons as those ministering to food, clothing, and six other primary wants. In 1861 this classification is modified by the addition of some new categories, in all twelve. For example, out of 10,000 occupied persons 18 minister to religion, 5 to amusement, 1 to science and art, and 1816 to food. A feature of peculiar interest in the census of 1861 was the inquiry concerning the religious profession of the people. The proportions proved to be, Roman Catholics 77.69 per cent; Protestants 22.23 per cent; a small margin of not quite 1 per cent being left for the Jews and the unspecified. Of the Protestants a little more than half belonged to the Established Church. These proportions have been approximately maintained in succeeding enumerations. The latest returns give Roman Catholics 75.4 per cent, Protestants (Episcopalians, Presbyterians, and Methodists) 23.5 per cent; leaving for Jews and other persuasions, as before, about 1 per cent (census of Ireland for 1891: Preliminary Report). In 1871, as in 1861, the returns as to occupation are arranged both according to the English six-fold classification and the system grounded on the wants to which different occupations minister. The Irish commissioners defend the indigenous system with much warmth. The census of 1881 conforms to the English classification with more docility. The later censuses of Ireland deserve commendation for the completeness of the agricultural returns.

A general idea of the scope and purpose of a census may be obtained by noticing the salient points in a particular report; the latest completed for England and Wales, namely that for 1881; the returns for 1891 not been fully analysed at the time of writing. (1) The first heading is *Number of the population and rates of increase*. The number falls short of twenty-six million by only a few thousands. The rate of increase per cent is 14.36 per decade; greater by 1.17 than for the preceding decade. The increase, determined by actual enumeration, differs little from the "natural increment"

determined by subtracting the number of deaths from the number of births. Hence two methods of forecasting the future increase of population. Either we may observe the natural increment for the year or two immediately adjacent to 1881, and assume that this rate will remain constant for the following decade; or we may assume that the actual rate of increase for the decade 1871-81 will continue to prevail for the next decade. A variant of the second method takes account of the fact that the decennial rate of increase is itself increasing. The average of the results obtained by these three methods gives, as the probable population in 1891, 29,843,898. This prophecy has not been fulfilled. The "preliminary report" for 1891 records 29,001,018 as the population of England and Wales in this year. Taking account of these circumstances, Dr. Longstaff made a more accurate prophecy: namely that the result of the enumeration in 1891 would be 29,012,776 (*Economic Journal*, No. 2). It is interesting to observe that the number prophesied in 1871, viz. 26,006,098, corresponds fairly well with the number enumerated in 1881, viz. 25,974,439. The increase of the town population is found to be more rapid than that of the country. (2) *Density of the population and habitations* is the second heading. The density, whether expressed as the mean distance between individuals, or in more familiar terms, is found to vary from place to place and to increase from age to age. The proportion between the number of persons and the number of habitations is less variable. (3) *Sexes*. The excess of females over males is more than 5 per cent, and is increasing. (4) *Ages*. At this stage we reach less solid ground, and "must proceed with much care and circumspection." The returns of age are falsified by various causes. Many are ignorant and put down a round number at random. Then there is the confusion between years of life and years completed, "the twenty-first year of life and twenty-one years old." The very old desire to appear still older. Very young women overstate their age with a view to obtaining employment; women not very young understate their age. From this double cause the category of female ages between fifteen and twenty-five is enormously exaggerated. All that can be done is to distribute the answers in periods of five years; and, assuming that these totals are correct, to determine by interpolation the numbers for each year. (5) *Condition as to marriage or civil condition*. The immense army of nearly four and a half million wives supplies an effective force of nearly three million "of reproductive age," between fifteen and forty-five. The number of single women and widows of this age-period almost exactly equals the number of wives. The proportion of married persons to the adult population is declining.

(6) "The most laborious, the most costly, and after all, perhaps, the least satisfactory part of the census" is that which is concerned with the *occupations* of the people. One difficulty is obscurity of the answers given. What sort of occupation is designated by an "all-rounder," or a "barker"? The same designation may have different meanings. Thus clothier means in some parts cloth-maker, in others cloth-dealer. There is also the difficulty of multiple occupations. In the census of 1881 the six-fold classification framed by Dr. Farr is adopted, with certain modifications. To reproduce the figures in detail would be out of place here. The following round numbers strike the imagination and impress the memory. The number of persons engaged in transport is a million. The number employed on textile fabrics is a million. The number employed on dress is a million. The number of labourers (agricultural and others) is a million and a half; of miners nearly half a million. The numbers of the professional classes and of those employed in preparing food are less round, each nearly 650,000. (7) Under the head *Birthplaces of the population* we learn what proportion of the inhabitants have filtered into England from other countries: about 1 per cent from Scotland, 2 per cent from Ireland, and from abroad only '67 per cent. (8) *Infirmities* comprise blindness, deaf-mutism, and the various forms of mental unsoundness. It is gratifying to find the relative numbers of the blind (about 1 per 1000 of the population) diminishing. That men should become blind oftener than women is not surprising. That congenital defects both of body and mind should be commoner in the stronger sex is less in conformity with preconceptions. (9) The ninth section of the report summarises the results for *The United Kingdom*. (10) The last section relates to *The British Empire*. "The territory occupied by the 254,187,630 inhabitants of the British empire is estimated as consisting of slightly over eight millions of English square miles," a territory more than sixty-six times as extensive as the surface of the United Kingdom.

A more recent, but less complete, model of a census is presented by the preliminary report of the census of 1891, for England and Wales, which has just been issued. The Report begins by stating the total number of persons returned as living in England and Wales at 12 P.M. on 5th of April 1891: namely 29,001,018. The deficiency of this number, as compared with the estimate formed in 1881 (see above), is accounted for partly by a diminution in the natural increase partly by an increase in the net emigration from England and Wales during the decade. A deficiency of 288,782 is ascribed to the diminished natural increase, of 414,568 the increased excess of emigrants. The decline in the natural increase was not due to increased

mortality but a decrease in the birth-rate. The number of families, 6,146,901, has not increased in proportion to the population; the number of inhabited houses, 5,460,976, has increased in a rather larger proportion; but there is some uncertainty about both figures. The rate of increase of population varies in different areas; speaking generally, being highest in the counties adjacent to London and counties in which coal-mining is the predominant industry. Fourteen rural counties show an actual decrease. The general law that a district increases more rapidly the more decided its urban character is not overthrown by the figures which show a smaller percentage increase for districts with populations above 100,000 than for districts with populations between 20,000 and 100,000. For "probably, or at any rate possibly," the contradiction is only apparent, the newcomers in the larger towns having to settle outside the municipal or official boundary. Accordingly the decrease in Liverpool of 6·3 per cent, and the falling off of increase in other larger towns, need not imply a decline in prosperity. The population of London, "the London of the Registrar-General," has increased in a somewhat lower rate than the population of England and Wales as a whole—the first time that such a phenomenon has presented itself.

The report concludes with summary tables relating to the other parts of the United Kingdom and the islands in the British seas. The following table shows the figures for the United Kingdom at the last two censuses.

Enumerated population of the United Kingdom

	1891.	1901.
England and Wales	29,002,525	32,526,075
Scotland	4,025,647	4,471,957
Ireland	4,704,750	4,456,546
United Kingdom.....	37,732,922	41,454,578

The census of 1901 is so recent that we can only give the totals.

The rate of increase of the United Kingdom in the decade 1881-1891 was 8·2 per cent; lower than in either of the two preceding decennia, in the first of which, 1861-71, it had been 8·8; in the second, 1871-81, 10·8 per cent. The falling off in the rate of growth was shared by all the divisions of the kingdom, but unequally. The population of the islands in the British sea enumerated in 1891 was 147,870; showing an increase of 4·7 per cent as compared with the enumeration of 1881; and a considerable increase in the rate of growth, there having in fact been a decrease in the period 1881-1891.

Valuable as these results are, and though the British census may be described as a good article at the price (about 1d. per head counted in England and Wales, 1871), there is room for many improvements. The reform most

loudly called for is that the census should be quinquennial. A committee of the Royal Statistical Society (*Journal*, 1888, p. 817) urged that the additional cost incurred by the reform would be small in comparison with the advantage of obtaining correct returns of population. They pointed out that the estimated population for certain districts was inaccurate to the extent of 11, and even 18 per cent. This argument has now become *a fortiori*, owing to the imperfections, disclosed by the census for 1891. Dr. Noel Humphreys, in his "Results of the Recent Census and Estimates of Population in the largest English Towns" (*Journal of the Statistical Society*, June 1891), gives instances of towns in which the hypothetically estimated death-rate differed from the true figure by as much as 20 and even 26 per cent. The estimates based on the decennial census were so worthless that they seemed to evidence a decline in the death-rate of Salford and Liverpool, while in reality there was an increase. The Statistical Society has also, through the mouth of various committees, advised that the character, as well as the number, of dwellings should be returned. As Mr. Palgrave shows (*Journal Statistical Society*, 1869, p. 411), information as to the house accommodation of the people is very deficient, and more complete returns would be very valuable. Another recommendation sanctioned by the Statistical Society is that the religious profession of each inhabitant should be obtained. Mr. Longstaff, in his "Suggestions for the Census of 1891" (*Journal of the Statistical Society*, 1889, p. 437), proposes that the number of rooms in dwelling-houses should be recorded. He would discontinue inquiries as to persons of unsound mind. Mr. Longstaff reinforces the arguments in favour of a quinquennial census. An annual census has been proposed by the late Sir Edwin CHADWICK (*Journal of the Statistical Society*, 1889, p. 468; *Internat. Stat. Congress*, The Hague, pt. ii. p. 164). Major Craigie demands more conformity between the census and the returns of the agricultural department. "There must be large omissions in the ranks of land occupiers in our census." (*Journal Statistical Society*, 1887, pp. 98, 149, and Jubilee vol.)

The glory of instituting the first census does not belong to England. While the Population Bill of 1753 was denounced in the House of Commons as subversive of liberty, Sweden was already enjoying a tolerably perfect census. Sweden had the advantage of very complete parish registers, recording not only births, deaths, and marriages, but also the number of persons migrating to or from each parish and residing in it. By the agency of the clergy these materials were embodied in a census in 1749 and subsequent years, first at intervals of three, subsequently of five years. The results of the early Swedish census, communicated to

the scientific world by the celebrated Wargentin, were utilised by Dr. PRICE (*q.v.*) and MILNE (*q.v.*) (*Annuities*, ch. xii.-xiii.) MALTHUS (*q.v.*) builds upon these statistics (*Essay*, bk. ii. ch. ii.), noticing the correlation between the lean years and the diminution of marriages. In the recent publications of the Swedish Bureau the study of such correlations is facilitated by affixing to each year a numeral (from I. to X.) indicating the quality of the harvest (see *Journal of the Statistical Society*, xxv. p. 141). Looking at the whole series, "the gradual diminution of mortality since the middle of last century is very striking" now, even more than when Malthus made this observation. The increase of suicides is less gratifying. The unrivalled length of the Swedish records affords particularly striking instances of those uniform relations which constitute what has been called *physique sociale*. The proportion of male to female births was 1.043 to 1 in 1751-60, 1.050 to 1 in 1851-55.

Spain has some claims to priority. A tolerably complete census of the dominions of Castile was taken as early as 1594. There was a general census of Spain in 1787 and in 1797. But then occurred a pause down to the census of 1857. During the first half of the century Spain lagged behind the statistical movement which was general in Europe.

The age initiated by the French Revolution was truly called by BURKE the "age of statistis." In France a census was ordered in 1791 and executed in 1801. In Prussia a statistical bureau was founded in 1805. The impulse was followed by other states, at different times and with varying pace—some with quinquennial, some with triennial intervals. The inquiries have become more fruitful by the addition of new questions, and the fruit has become more accessible through increasing uniformity of the questions in different countries. The branches of the European census, as they lengthen, become not only broader, but more parallel. The possibility of international comparison is partly due to the action of the International Statistical Congress during the quarter century which followed its first meeting in 1853. The extent to which its recommendations have been adopted may be expressed by the following statement. At the congress of St. Petersburg (1872) consolidating the results of discussions which had been carried on at several preceding congresses, twelve questions or rubrics (as to name, sex, age, etc.) are proposed as "essential," or obligatory. Of these recommendations the first seven are already adopted in twenty-five continental bureaux, with only one or two exceptions. The remaining five directions are carried out, roughly speaking, in about half of the continental states. Among the headings about which it is difficult to obtain uniformity may be instanced *conjugal condition*. At the Florence congress (1867) it was proposed to

ascertain the relationship of husband and wife. The question is put in Sweden and some other countries. *Population, de fait et de droit*—The Italian census grapples with the difficult questions connected with domicile by an elaborate arrangement distinguishing the birds of passage from the residents, and the temporary from the permanent absentees. *Age*—Considering the inaccuracy of returns under this head, is it worth while publishing them in full and without manipulation? Some European bureaus have decided in the affirmative. *Language spoken*—What does this heading mean? the language most used in good society, or in the family, or in the church? *Occupations* form a rubric which is the despair of the international statisticians. The diversity of employment in different countries is aggravated by the difficulties of language. What would a Frenchman understand by "clerk of the parish," even when translated (?) into "clerc de paroisse" (*sic*)? "Carvers," one of the designations in the St. Petersburg scheme, should not have been rendered in French as "agens des abattoirs." On these and other topics perfect unanimity is still only an ideal. Even when agreement has been obtained as to the questions to be asked, there still remains diversity in the arrangement of the answers. To smooth these remaining differences may, it is hoped, be a function of the International Statistical Institute, founded in 1885. As M. Korösi, one of the ablest advocates of uniformity, points out, the diverse practices mostly involve no question of principle; it would give no additional trouble to act in concert. It is needless to dwell on the advantages of increased uniformity. The census was used by ancient Rome as an engine of government; modern Europe should make it also an instrument of science.

[For the antiquities of the subject Gabaglio, *Storia . . . della Statistica* (2d ed., 1888), may be consulted. For the history and scope of the census in the United Kingdom, see the preface or report which is attached to every census except the first. Proposals for reform are expressed in the recommendations made by a committee of the Statistical Society before each census (see *Journal of the Statistical Society* for 1840, 1850, and subsequent decades). Mr. Palgrave's paper, *Journal of the Statistical Society*, 1869; and Dr. Longstaff's paper in *Ibid.* 1889 contain other proposals besides those which have been noticed. A general view of the earlier methods of taking the census on the continent is presented in the *Journal of the Statistical Society*, vol. iii. Mr. Hendriks' detailed accounts of the Spanish and the Swedish censuses, in the 23d and 25th volumes of the same journal, are very valuable. As to the history and scope of the census in the different European states, copious information will be found in the records of the International Statistical Congress, especially in the reports made by the members for each nation. In the same publication will be found repeated

proposals for securing greater uniformity. A conspectus of these recommendations is presented by M. Korösi in his *Projet d'un Recensement du Monde* (Paris, 1881). Attention is due to his own recommendations offered in that work and in his address to the Jubilee meeting of the Royal Statistical Society (Jubilee volume, 1885), and in his contribution to the second *Bulletin of the International Statistical Institute*, p. 200. A comparison of the statistics obtained by the census in different countries is afforded by *Confronti Internazionali* (published by the Direzione Generale della Statistica), Roma, 1884. Many of the figures there compiled have been extracted by Sir Rawson Rawson, who has added explanatory comments (Presidential address to the Statistical Society, *Journal*, 1885). The most recent results for several European countries and for the Cape Colony and Victoria are presented together in the *Notes on the Preliminary Returns of the Censuses, 1890-91*, in the *Journal of the Statistical Society* for Sept. 1891. Less recent comparisons are *Movimento della Popolazione in Italia e in altri Stati d'Europa*, by M. Bodio; *Archivio di Statistica*, 1876; *Mouvements de la Population dans les divers états de l'Europe*, by M. Bertillon; *Annales de la Démographie Internationale*, vol. i.; and other articles in that series (extending from 1877 to 1883). See also Quetelet, *Physique Sociale*, 1869.]

F. Y. E.

CENSUS, UNITED STATES. The mode of conducting the census of the United States is so important as to demand special notice.

History of the Census.—The origin of the census system in the United States lay in the necessity of establishing some basis for the distribution of representatives and direct taxation among the different states. When the colonies associated themselves together to resist the mother country it was necessary to find some method of distributing the expenses of the war. The congress which assembled in 1775 had no power to assess and collect taxes through officers of its own. The draft of the articles of confederation (1776) provided that expenses should be distributed according to the population of the states, which should be ascertained triennially and transmitted to the assembly of the United States. The southern members objected to the slaves being counted with the whites, and in the articles of confederation finally adopted (1777-1781) it was provided that all expenses for war or the common welfare should be apportioned among the states "according to the value of all land within the state granted to or surveyed for any person, as such land, and the buildings and improvements thereon, shall be estimated according to such mode as the United States in congress assembled, shall from time to time direct and appoint" (art. 8). The land force, on the other hand, was to be furnished by the different states according to the number of white inhabitants in each (art. 9). Neither of these provisions ever led to a census; in fact in 1783 congress recommended

the levying of money in proportion to the population rather than according to land-value, and drew up a table of the estimated population in each state. In this estimate only three-fifths of the slaves were counted. This amendment did not prevail, but we see here the origin of the three-fifths rule which crept into the constitution of 1787 (art. 1, § 2), which is the legal basis of the census at the present time. That clause reads as follows:

"Representatives and direct taxes shall be apportioned among the several states which may be included within this union, according to their respective numbers, which shall be determined by adding to the whole number of free persons including those bound to service for a term of years, and excluding Indians not taxed, three-fifths of all other persons. The actual enumeration shall be made within three years after the first meeting of the Congress of the United States, and within every subsequent term of ten years, in such manner as they shall by law direct."

To carry out this provision of the constitution, congress passed the first census law, 1st March 1790. The law has since been so extended that from a mere enumeration, the census has become an elaborate description of the social and industrial condition of the people of the United States. This progress has in one sense been gradual, but the census of 1850 and that of 1880 stand out as marking epochs, setting the standard for those that followed.

The census of 1790 was a simple enumeration of the people under the following classification: free white males of 16 years and upwards, free white males under 16 years, free white females, all other free persons, and slaves. The census of 1800 was similar in scope except that the age classification was slightly more elaborate, namely: under 10 years, from 10 to 16, from 16 to 26, from 26 to 45, over 45, with distinction of sex. The same population schedule was used in 1810; in addition questions were asked in regard to manufactures, but the latter returns were so incomplete as to be of no value. They were equally incomplete in 1820, and in 1830 the inquiry was omitted. In 1820 the age classification was further elaborated; "foreigners not naturalised" distinguished; and the people divided, according to occupation, under agriculture, commerce, and manufactures. The census of 1830 adopted the age classification: under 5 years, from 5 to 10, from 10 to 15, from 15 to 20, from 20 to 30, and then by decennial periods. It also distinguished the blind, and deaf and dumb, by colour and certain ages. In 1840 the number of insane and idiotic, white illiterates, and statistics of schools were added. A manufacturers' schedule was again attempted, but without much success. The census of 1850 was more elaborate. It included the number of dwelling-houses, of

families, of persons according to sex, age, colour, free or slave, profession or occupation, value of real estate, number of persons married within the year, attendance at school, illiteracy, the deaf and dumb, blind, insane, idiotic, pauper, and convicts, mortality statistics for the year, products of agriculture and industry, wages, capital, taxes, colleges and schools, newspapers and periodicals, and churches. Most of our comparisons at the present time go back to this census. In 1879 a new act was passed which resulted in the elaborate "tenth census of the United States," a description of which is given below.

Method of taking the Census.—The returns of 1790 were taken under the supervision of United States marshals and sent to the president of the United States. From 1800 to 1840 they were sent to the secretary of state and published by him. In 1850 the census office was created in the newly-established department of the interior; since then a superintendent of the census has been appointed for each census. The law of 1st March 1889, for the taking of the eleventh census (1890), provides for the appointment of (not more than) 175 supervisors who shall appoint enumerators, the latter to visit personally every family in their sub-divisions and by inquiry obtain all particulars required by the law, which also allows schedules to be distributed in advance, to be filled up by householders and others. The schedules to be employed will be (as in 1880) a population schedule, one for farms, for manufactures, for mortality and vital statistics, for social statistics, and for transportation companies. Where there is an official registration of deaths, the superintendent may withhold the mortality schedule from the ordinary enumerators and obtain the statistics through official records. The superintendent may withhold also the schedules for manufacturing, mining, and social statistics, and charge the collection of these statistics upon experts and special agents. He may also employ special agents to investigate the statistics of the manufacturing, railroad, fishing, mining, cattle, and other industries of the country, and of telegraph, express, transportation, and insurance companies as he may require. The census shall also take on a special schedule the names, organisations, and length of service of those who had served in the army, navy, or marine corps of the United States in the war of the rebellion, and who are survivors at the time of the inquiry, and widows of soldiers, sailors, or marines. The population schedule shall include an inquiry as to the number of negroes, mulattoes, quadroons, and octoroons. The superintendent shall also collect the statistics relating to the recorded indebtedness of corporations and individuals; also, information relating to animals not on farms. The cost of the census of 1890 is not to exceed

\$6,400,000 (say £1,280,000), exclusive of printing, engraving, and binding. The cost of the census of 1880 was about \$4,853,350 (say £970,000). One of the criticisms made on census methods in the United States has much weight, namely, that, the census office should be permanent. At present, as soon as the census is completed, the office is abolished, and the skilled force is disbanded. The result is that every census is taken by men who are often inexperienced, and all the benefit of previous practice in statistical work is lost. There should be a permanent statistical office to which the decennial census could be entrusted, and which during the intervening period could perform much of the work which is now crowded upon the decennial enumerations, such as investigations as to industries, public indebtedness, social statistics, etc.

The Scope of the Census.—This is best seen by a survey of the tenth census, an extraordinary undertaking, unlike anything that preceded it in the United States, and such as will probably never be attempted again. In the words of the superintendent,¹—"It was intended to form a grand monumental exhibit of the resources, the industries, and the social state of the American people on the occasion of their tenth ten-year enumeration. In its nature much of the work done from 1880 to 1883 is definitive or else such as to require only slight additions or corrections from time to time."

The tenth census falls into two parts: the ordinary statistics of population, wealth, and industry; and the special investigations and reports of experts having only a semi-statistical character. It will be necessary to dismiss these latter with only a word.² They are not properly census work, and their value can be estimated only by scientific men. The "Forest trees of North America," for instance, is an elaborate description of the trees of the United States, their distribution, their value as lumber, the strength of different kinds of wood, etc. The volumes on "Cotton-growing" contain a similar elaborate description of the cotton-growing states of the south, soil and climate, strength of cotton fibres, methods of cultivation, etc. Other volumes do the same for tobacco, the cereals, petroleum, coke, building stones, precious metals, other metals, and the natural water power of the United States. Still others contain elaborate descriptions of machinery used in various industries, and the processes of production. Such, for instance, are the reports on flouring mills, on the ice industry, on pumps and steam engines. Still further removed from a statistical investigation is the volume containing the mining laws of the United States

and of the several states and territories. Two volumes contain "Statistics of Cities," in which an attempt is made to give a history of each city and town in the United States and a description of its government, institutions, sewerage system, pavements, etc. All this is scientific work, not census work. "It is not to be expected that succeeding censuses will be of such colossal magnitude."

Real census work falls under the following heads: (1) population; (2) mortality and vital statistics; (3) agriculture and fisheries; (4) manufactures, mining and mechanical industries; (5) transportation; (6) taxation and public indebtedness.

Population.—There are some peculiarities of census work in the United States which explain the size of the publications, and which are of scientific interest as differentiating it from the ordinary census work of the countries of Europe.

(1) One is the size of population and the extent of country covered by the census. In 1880 the enumeration covered fifty million people, the next census covers not far from sixty-three millions. The country is divided into forty-eight states and territories. All the facts of the census are presented for each state and territory, for the purpose of satisfying local interest. Still further, the states and territories are divided into counties, sometimes more than a hundred in a state, and most of the tables carry the figures out for the counties. There are 2605 counties in the United States. The counties are divided into townships, wards, etc. The towns and cities are often different from these in their boundaries, and in many cases separate presentations are made for these minor civil divisions.

(2) An elaborate attempt was made to connect population with the facts of physical and political geography, such as climate, altitude, rainfall, eastern, western, and southern sections, etc. The immense territory of the United States offers such a variety of physical characteristics, and the history and colonisation of the several sections have been so different, that a wide field (it was hoped) would be opened for the use of statistics in sociological speculation.

(3) Two elements in the population of the United States are of very great interest. One is the coloured population, the other the foreign-born. In no other population do we find the opportunity to study such social questions as those presented by the presence of a race different in blood from the dominant race and just lately emancipated from servitude, and by the presence of a numerous body of foreigners. Ethnic questions have nowhere such a field for statistical determination. With this feeling the census has, in almost all its investigations, analysed the results with distinction of race and place of birth. Such are the characteristics of the census which make it of particular scientific

¹ *Quarterly Journal of Economics*, ii. 143, 145.

² See titles of volumes of the Tenth Census at end of this article.

importance. We will now examine some of the results :—

The total area of the United States is over 3,000,000 square miles, but of this only 1,569,570 square miles have a density of population of 2 to the square mile. This is called the settled area, and has steadily increased since the beginning of the occupation. The growth of population and of settlement at the successive census periods is seen in the following table :

Year.	Population.	Settled Area.	Density per sq. mile of settled area.	Increase per cent of Population in Decade.
1790	3,924,214	239,935	16·4
1800	5,308,483	305,708	17·4	35·10
1810	7,239,881	407,945	17·7	36·38
1820	9,633,822	508,717	18·9	33·06
1830	13,866,020	632,717	20·3	32·51
1840	17,069,453	807,292	21·1	33·52
1850	23,191,876	979,249	23·7	35·83
1860	31,443,321	1,194,754	26·3	35·11
1870	38,558,371	1,272,239	30·3	22·65
1880	50,155,783	1,569,570	32·0	30·08

This table shows the rapid growth of population and its slight increase in density on account of the constant extension of the area of settlement. For further illustration the census has adopted the following classification of density of population. Group 1, from 2 to 6 to a square mile, represents a very sparse population, supported perhaps by grazing (frontier); group 2, from 6 to 18 to a square mile, represents agriculture in early stages or on a rugged soil; group 3, from 18 to 45 to a square mile, represents, in the United States, well-developed agriculture; group 4, from 45 to 90 to a square mile, indicates the presence of manufacturing industry; group 5, over 90 to the square mile, represents advanced industry. A series of tables and coloured CARTOGRAMS presents the distribution of population according to these groups at each decade since 1790. It is a most interesting and unique study of the process of settlement in a new country, at first the tide of settlement being controlled by the course of navigable rivers and the removal of hostile Indians, and later by lines of railroads. The following table will show the area of settlement for the different groups in 1880 :—

	Sq. miles.
Group 1, from 2 to 6 to a sq. m. .	384,820
„ 2 „ 6 „ 18 „ „ .	373,890
„ 3 „ 18 „ 45 „ „ .	554,300
„ 4 „ 45 „ 90 „ „ .	231,410
„ 5 „ over 90 „ „ .	25,150

Outside of cities only a very small strip of territory along the Atlantic seaboard has acquired the density of population due to advanced industry.

In a similar way the distribution of population is shown according to latitude and longitude (the greater part of the population live between latitude 38° and 43°, one half to the north of 39° of latitude, and to the east of 83°

of longitude; according to elevation above sea-level (nearly two-fifths live below 500 feet, and three-fourths below 1000 feet); according to drainage basins (the greater part of the population is in the Mississippi valley); according to mean annual temperature, to mean temperature in July, to mean temperature in January, to maximum temperature, to minimum temperature, to annual rainfall, and to spring and summer rainfall. The centre of population is said to be at 39° 4' 1" latitude, and 84° 39' 7" longitude, or at a point about 8 miles west by south of Cincinnati. All these calculations except the last are carried out for the foreign-born and the coloured as well as for the total population.

Turning now to the distinctions of colour and race, the population of the United States in 1880 was as follows :

Total	population	. 50,155,783
White	„	. 43,402,970
Coloured	„	. 6,580,793
Native	„	. 43,475,840
Native white	„	. 36,843,291
Foreign-born	„	. 6,679,944

The coloured population is mostly in the southern states; in three of them (South Carolina, Mississippi, and Louisiana) the coloured are in excess of the whites. The foreign-born are principally in the north, and especially in the large cities. The coloured are almost all of them of native birth, and the foreign-born are almost all of them whites, so that the two elements are entirely separate in the statistics. It is to be borne in mind that the terms "native" and "foreign" refer always to place of birth, not to descent or alien condition. Children of immigrants born on the soil of the United States are classed as natives. This is unavoidable, but has led to many false conclusions in regard to the influence of the foreign element in the United States. We cannot say, for instance, how many of the people of the United States are descendants of the original settlers, and how many of immigrants since 1820. The census did inquire as to the birthplace of the parents, and by means of this inquiry discovered that nearly 15,000,000 inhabitants of the United States were either born abroad or children of parents born abroad. It is one of the most interesting points of the tenth census to follow out these foreign-born. They congregate largely in cities, 34·2 per cent of the total number being found in the largest 44 cities (of Irish 45·26 per cent, of Germans 38·73 per cent, and of Italians 60·80 per cent were in large cities). The census follows the foreign-born into different occupations. Of all the persons engaged in agriculture in the United States, 10·60 per cent were of foreign birth; of those engaged in professional and personal services, 24·48 per cent; of those in trade and transportation, 25·33 per cent; and

of those engaged in manufactures, mining, and mechanical industries, 31·95 per cent were of foreign birth. Other statistics show the proportion of foreign-born among illiterates, prisoners, convicts, paupers, deaf and dumb, insane, blind, etc. The figures must be used with caution, because the census was not altogether successful in the enumeration, and because no regard was paid to the age classification, although the abnormal proportion in some of these cases (insane, blind, etc.) is due to the abnormal proportion of adults among the foreign-born. This whole inquiry as to the foreign-born is a characteristic part of the American census.

The other population tables do not differ from those in use in Europe. The classification by sex shows a proportion of only 965 females to 1000 males, contrary to the usual case in Europe, but easily explained by immigration. In the eastern states there is an excess of females, owing to emigration of males westward, in the south also an excess of females, due apparently to the usual cause, namely, greater mortality among males. The age classification shows a large number of children, especially among natives, but this latter figure must be used with great care because children of immigrants born on this soil are classed as natives. The urban and rural classification shows 22·5 per cent of the population living in towns of 8000 inhabitants and over (in 1790 it was only 3·3 per cent), and 25·5 per cent living in towns of 4000 and over. Of the people of the United States engaged in gainful occupations, 44·1 per cent were engaged in agriculture, 23·4 per cent in personal and professional services, 10·4 per cent in trade and transportation, and 22·0 per cent in manufactures, mining and mechanical industries.

II. *Mortality and Vital Statistics.*—As there is no uniform registration of births and deaths for the whole of the United States, and in most of the states having registration it is very imperfect, American mortality and vital statistics are sadly deficient. The tenth census tried to collect the number of deaths during the census year and the ages of the deceased. By comparison with one or two states where there is registration, it was estimated that the census returns were thirty per cent short of the actual number of deaths. The office, in addition, by correspondence with nearly thirty thousand physicians, tried to make up this deficiency, and to ascertain with accuracy the cause of death. This inquiry was only partially successful. In large cities where there was already a registration of deaths, the census office simply copied the list. The births were obtained by adding to the number of children under one year of age the number of children reported as born and dying during the census year. The number was supposed to be 15 per cent short of the actual births. With such imperfect material, the birth-

and death-rates, the proportion of deaths from different diseases according to age, sex, locality, race and nationality, the mortality tables, etc., must have a very uncertain value. The birth-rate is probably about 36 per 1000, the death-rate about 18 per 1000. The only excuse for the census undertaking this impossible task is that no one else will.

III. *Agriculture.*—These returns were made on a separate farm schedule filled by each farmer under the direction of the enumerator. The figures as to acreage rest on no official survey, but simply on the statements of the farmer. The statistics serve a double purpose: to display the condition of farming as a national industry, and to show the value of agricultural products as a contribution to national wealth. Under the first head, the number of farms was 4,008,997, comprising 536,081,835 acres, or 28·9 per cent of the total land area. But nearly one half (46·9 per cent) of the land in farms was unimproved, mostly woodland and forest. The average size of farms was 134 acres, but this varied greatly with localities. About 74 per cent of the farms were cultivated by owners, about 8 per cent by tenants paying a money rent, 18 per cent were cultivated by tenants paying a share of the product as rent. The value of farms including buildings was estimated as \$10,197,096,776 (say £2,040,000,000). Under the second head the census gives detailed information as to number and value of live stock on farms, acreage devoted to different crops, amount and value of different products, such as wheat, corn, cotton, etc. for 1879, details which it would be useless to repeat here.

IV. *Manufactures.*—These statistics were collected with great care and comprise all factories and workshops producing to the value of \$500 (say £100) per annum and over down to the village blacksmith or carpenter. The statistics of industry are regarded with great interest in the United States as indicative of the growth and material prosperity of the community. Especially is this true in the rivalry of state with state, and of city with city, and many bitter attacks were made on the census office because the results did not come up to local expectation. None of these was substantiated. The statistics have been collected since 1850 on the same plan, and give some interesting points of comparison, as shown in the following table (values for 1870 reduced to gold basis):

Year.	Value of gross product.	Value of raw materials.	Total amount of wages paid.	Capital.	Number of hands employed
	\$	\$	\$	\$	
1850	1,019,119,616	555,123,822	236,759,454	533,245,251	958,079
1860	1,885,891,676	1,031,603,094	378,878,966	1,099,855,715	1,311,246
1870	3,385,860,354	1,990,741,794	620,467,474	1,694,567,015	2,053,996
1880	5,369,579,191	3,396,823,549	947,363,795	2,790,272,006	2,732,595
	£	£	£	£	
1850	203,823,923	111,024,764	47,351,893	106,649,050	958,079
1860	377,172,385	206,321,018	75,775,793	219,971,143	1,311,246
1870	677,172,070	398,148,339	124,093,485	338,913,403	2,053,996
1880	1,073,913,828	679,364,719	189,590,759	558,055,321	2,732,595

(In £ sterling, \$ converted as $\$ = \text{£}1$.)

These figures seem to give a fair picture of the manufacturing industry of the United States. The return of total value has been criticised on the ground that the finished product of one industry is the raw material of another, and that thus the same material is valued several times in succession. But there seems to be no objection to this so long as value is added to the product at each stage. In another respect the census figures have been greatly abused. Persons have taken the cost of raw materials plus the total wages paid, and deducting it from the value of the finished product, treated the result as employer's profit. For the whole of the United States (1880) this figure would be \$1,024,801,847 (say £200,000,000), or more than the total wages paid. On the basis of the capital returned, this represented a profit of 36·5 per cent in manufacturing industries. In some cases it was still greater, as for instance in the boot and shoe industry, there appeared to be a profit of nearly 50 per cent. The fallacy arose from considering wages and raw materials as representing total cost of production, and from the difficulty of determining the real amount of capital invested. The eleventh census will attempt to remedy the false impression, in part, by adding to the cost of production the amounts paid for rent, for taxes, for insurance, for commissions, for interest, for freight and transportation, and other expenses. It also proposes to follow the example of the Massachusetts census of 1885, and include under the head of capital, credit capital, *i.e.* money borrowed, bills receivable in excess of bills payable, etc. This will doubtless prevent any such excessive sum appearing as profits again; but the whole attempt to show the rate of profit by means of a census enumeration is fallacious, and destined to failure.

Wages.—The total sum paid for wages during the census year divided by the whole number of employees gave an average wage, \$346·90 (say £70) per annum. This figure has no value because many of the persons were employed during only a part of the year, and because it averages the wages of men, women, and children. The average wage of employees in the principal industries is fallacious for the same reasons. The wage statistics of the United States are still incomplete. In 1890 it is proposed to attempt a classified wage, *i.e.* ascertain the number of men receiving \$5 (£1) per week, between \$5 and \$6 (£1 and £1 : 4s.), etc.

V. Transportation.—The statistics for railroads were collected on special schedules filled out by the companies themselves (1017 companies working 87,781·97 miles of road), and covering financial statistics, such as income and expenditure, amount of stock, bonds, and general indebtedness, traffic statistics, rolling stock, employees, accidents, etc. There are

similar reports for telegraphs, telephones, steam navigation, canals, etc.

VI. Taxation and Public Indebtedness.—This report (vol. vii.) deserves notice as our only source of information in respect to the amount of wealth, the burden of taxation, and the sum of public indebtedness for the whole of the United States. Each state has its own system of valuation and taxation, and its own statistics of local indebtedness, but these are not uniform and have never before been combined. The census office was able to accomplish this by extensive correspondence with state and local officers, and prominent bankers, and business men throughout the country. The results in regard to taxation were not entirely satisfactory. As regards wealth, the census office estimated the total wealth of the United States to be \$43,642,000,000 (say £8,700,000,000). The statistics of indebtedness reveal for the first time the amount of state and local indebtedness, the cause for which it was contracted, rate of interest paid, amount of sinking funds for its extinction, etc. The report analyses also the public debt of the United States, number of holders, amount of their holdings, amount in the hands of banks and corporations, the section of country where held, etc. This may not be true census work, but the student of finance is to be congratulated that the census office was willing to do it.

State Censuses.—Some of the states take a census at the intermediary period between the national. Most of these are mere enumerations of the people for the purpose of readjusting the distribution of representatives. The census law of 1879 tried to encourage the states to prosecute such work by providing that if any state or territory should take such a census at the intermediary period and in accordance with the schedules of the United States census, the United States government would pay one half of the expense of supervisors and enumerators. The provision had no effect, and was quietly dropped out of the act of 1889. Sixteen states and territories have taken a census since 1880, viz.:—Michigan in 1884; Colorado, Florida, Iowa, Kansas, Massachusetts, Minnesota, Nebraska, New Jersey, Oregon, Rhode Island, Wisconsin, Dakota, District of Columbia, and New Mexico in 1885; and Texas in 1887. None of these is of particular importance except that of Massachusetts, which is probably the most perfect piece of statistical work ever done in the United States.

Census of 1890.—The eleventh census was taken as of date 1st June 1890. Its general scope is indicated above under "Method of taking the Census." New features are, in the population schedule, the attempt to distinguish negroes, mulattoes, quadroons, and octoroons. Hitherto they have all been classed as "coloured." Other new inquiries are: "Can the person enumerated

speaking English? If not, indicate the language spoken. (To be asked concerning all persons ten years of age and upwards.)" Still further: "How many years have you been in the United States? Have you been naturalised? Have you taken out naturalisation papers. (These three questions to be asked concerning adult males of foreign birth only.) Mother of how many children, and number of those children living? (To be asked concerning all women who are or have been married.)"

In mortality and vital statistics, 80,000 registers have been distributed to physicians with request that they note all cases of death in their practice during the year. Special studies are to be made of birth- and death-rates, and of the principal causes of death in twenty-four of the largest cities; of the influence of race upon fecundity and mortality especially of mulattoes as distinguished from negroes and whites; and of the relations of occupation to death-rates and causes of death in manufacturing cities.

The investigation in regard to recorded indebtedness has special reference to farm mortgages and the condition of the farming class, and is to be conducted by special agents who will examine the records of mortgages in different parts of the country. The list of persons who served in the war of the rebellion will (it is estimated) fill eight 4to volumes of 1000 pages each.

The statistics are to be tabulated by electricity (Hollerith tabulating machine), thereby saving (as estimated) \$579,000 (say £115,800) and doing the work with greater speed and accuracy.

The principal results of the eleventh census, published up to 1st October 1891, are as follows:

Total population, 1890, 62,622,250
Increase since 1880, 24·86 per cent.

Area of Settlement.

Total settled area 1,947,285 sq. miles.

Population.

From 2 to 6 to a sq. mile	592,037 sq. miles.
„ 6 „ 18 „ „	393,943 „
„ 18 „ 45 „ „	701,845 „
„ 45 „ 90 „ „	235,148 „
„ 90 and over „ „	24,312 „

Urban population (in towns of 8000 inhabitants and over) was in 1890 29·12 per cent of total population.

Public Indebtedness.

	1880.	1890.
The U.S.	\$915,962,112	\$1,922,517,364
States	223,107,853	290,326,643
Counties	141,950,845	124,105,027
The U.S.	£183,192,422	£384,603,473
States	44,621,576	58,065,328
Counties	28,390,169	24,821,005

Converting the \$ as 5 = £1.

Estimated total national wealth, \$62,610,000,000 (£12,522,000,000), or nearly \$1000 (£200) per capita.

Many of the statistics of the Tenth Census will be found in the *Encyclopædia Britannica*, Art. "United States: Political Geography and Statistics" (F. A. Walker.)] R. M-S.

CENT, CENTESIMO or CENTAVO (words used as equivalent to each other—*Cent* in the United States of America, *Centesimo* in Peru and the Argentine Republic, *Centavo* in Chili, the United States of Columbia, the Philippines and Mexico). The 100th part of any DOLLAR, e.g. the dollar of the United States of America or equivalent coin (e.g. *Peso*, *Sol*, *Duro*, of Chili, Peru, etc.) Copper, nickel, or bronze token coins of various weights and dimensions.

CENT (Dutch). Bronze token coin weighing 59·34 grains; $2\frac{1}{2}$ and $\frac{1}{2}$ cents in proportion. 100 cents = 1 florin.

F. E. A.

CENTESIMI (Italy); CENTIMES (France,

Belgium, and Switzerland); CENTIMOS (Spain). Bronze token coins weighing 1 gramme (15·43235 grains) each. 100 = 1 franc (or its equivalent).

F. E. A.

CENTRALISATION. A term applied to the concentration of the functions of government, more usually those of an administrative character, in the hands of a single directing authority.

It is obvious that the supreme authority existing in any community is able to exercise a paramount influence upon its wealth and economic position. On this account many of the leading writers on economics have discussed, in some detail, "the proper limits of the functions and agency of governments," and incidentally the organisation by which those functions and that agency should be exercised. The results arising from the regulation and control of individual action by public authority have been seen to be frequently determined by the manner in which the authority is brought into existence, and the nature of the responsibility attaching to its actions; and some at least of the economic objections which present themselves to the multiplication of the duties of government, disappear when these are placed in the hands of local and sectional, as distinguished from imperial and national, authorities. Thus MILL points out that the evil of entrusting too much business to the government is "felt in great magnitude under some of the governments of the Continent, where six or eight men living at the capital and known by the name of ministers, demand that the whole public business of the country shall pass, or be supposed to pass, under their individual eye." But he adds that "the inconvenience would be reduced to a very manageable compass in a country in which there was a proper distribution of functions between the central and local offices of government" (*Political Economy*, 6th ed., 1865, p. 567). Sir Arthur Helps, too, calls attention to the now well-recognised fact that a carefully devised system of LOCAL GOVERNMENT affords an opportunity of practising that "habit of spontaneous action for a collective interest" without which the education of a people, as Mill observes, "is defective in one of its most important branches."

The extent to which it is better that the functions of government should be entrusted to a minor authority and dissociated from the national executive is not capable of any exact definition. It will differ in different nations, and at different periods of their existence. It must depend upon the willingness of those upon whom authority is to devolve to exercise it for the common good, and to sink individual interests in the desire to advantage the general welfare; much too, will depend on the education and intelligence of the constituency within which administrative powers are to be exercised,

and of the class or classes which are to wield them. The decision as to whether any given function may more properly be entrusted to an authority under the direct control of the national government, or to an authority independent thereof, rests rather with the statesman than with the economist. If, however, it be true that "people can understand their own business and their own interests better, and care for them more than the government does, or can be expected to do," then it would appear that the *onus probandi* should always rest upon the advocates of the exercise of governmental power in any direction. It must be shown to be for the general advantage that individual action should be replaced by the action of a small section of the community, and similarly that the nation as a whole will perform any given function better than the section immediately concerned. In other words the endeavour should be to restrict the exercise of public authority to the smallest possible area, and above all to secure that all who either directly or indirectly are responsible for the administration of public business should have an actual interest in the success of their administration.

In thus limiting the executive area, and restricting the exercise of public authority, as far as other circumstances will admit, to those directly concerned, care must be taken to preserve for the general use the wider experience and clearer insight into principles which a central authority will usually possess, and it will frequently be necessary to reserve some power of review to be exercised in the interests of minorities or of other sections of the community.

The English poor-law system affords a good illustration of a system of independent local administration combined with centralised supervision and control within certain prescribed limits. The maintenance of the poor being a matter of national concern, and it being impossible to localise the effects of good or bad administration in such a matter, parliament has prescribed the principles upon which relief shall be afforded and its cost raised. A department under a responsible minister has also been established to see that these principles are observed, and to furnish the best advice and information available. But it rests with the local authority to adjudicate on applications for relief, and generally to make provision for the due administration of the law.

Much of the legislation by means of "private bills" would be more efficient if it were entrusted to a less important, but more interested, authority than the imperial parliament, and the establishment of COUNTY COUNCILS may eventually afford a means of relegating many of the functions at present performed by the national executive to a minor authority better able to discharge them to the advantage of the section

of the community more immediately concerned.

In view perhaps of the fact that the British government is the least centralised in Europe, our own literature on the subject is much less ample than that of the Continent, and especially of France. John Stuart Mill's *Representative Government* and *Principles of Political Economy* (book v.), and Sir Arthur Helps's *Thoughts upon Government* may, however, be consulted. For the view of the MANCHESTER SCHOOL which is against Centralisation, see e.g. MALLET, *Free Exchange*, pp. 97, etc. Speech of COBDEN in ed. BRIGHT and ROGERS, vol. i. No. xx. pp. 362-3. ["Government will revert to something like the municipal system."]

T. H. E.

CERTAINTY. Certainty is an economic conception of great importance in several departments. The certainty of enjoying, partially at least, the fruits of one's own exertion is one of the principal elements in the efficiency of labour (contrast slave with free labour). In the accumulation of capital, and in the institution of private property, certainty is again fundamental. The essence of CAPITAL (*q.v.*) is held to be in the reservation of WEALTH for future consumption or the satisfaction of future needs, which implies that the fund reserved will be secured to a greater or less degree. The degree of certainty naturally operates upon the rate of interest when capital is lent. Certainty is also used in reference to taxation as regards the manner, time, and amount of payment, and as the basis of Adam SMITH's second canon. He considers certainty to be of such importance that a very considerable degree of inequality is "from the experience of all nations, not near so great an evil as a very small degree of uncertainty." In insurance the certainty attaching to groups, relatively to the uncertainty in the case of individuals, is the fundamental conception.

[Uncertainty of employment, as an evil of the present industrial régime, is dealt with by Prof. Foxwell in *Claims of Labour* (Edinburgh, 1886)].

J. S. N.

CERTIFICATE, SHARE. A broker, when he has bought shares in a company for a client, has to deliver a document called a certificate, which is the only visible sign of the property in the share. It is signed by one or more officials of the company, and when the shares are sold must in most cases be given up. Several decisions in the courts have shown that a certificate, although registered in buyer's name, is worthless in the event of forgery of the seller's name on the transfer, and no claim can be upheld against a company, notwithstanding the registration of transfer and issue by it of the certificate in the buyer's name. The FORGED TRANSFER ACT, 1891, gives a company power to compensate a holder so defrauded, but a certificate is not absolute security. American railroad share certificates are peculiar; as the certificate may be made in the name of another person, whereas

the owner of the document may have paid for it without his name appearing as the owner either on the certificate or on the company's books. The American share document usually carries a transfer, and this is almost as usually left blank when the seller has given up his interest in the share, not naming the buyer. These certificates therefore pass very much as bonds to bearer. Awkward legal cases have arisen out of this loose custom.

A. E.

CESARE, CARLO DE, born at Spinazzola (Bari) 1824, died at Rome 1882. First as a deputy, and later as a senator, he was employed in reporting on important laws and charged with delicate commissions, such as the inquiry into the condition of the navy after the battle of Lissa, and on the state of Sicily in 1875. He was Counsellor of the "cour des comptes"; having been, before reaching this dignity, inspector-general of the banks of issue. He was the author of a manual of political economy, putting forward principally the doctrines of RICARDO; this book is useful even now on account of a chapter it contains of historical notices concerning political economy in Italy. *Manuale di Economia pubblica*, 2 vols. Torino, 1862. De Cesare wrote also upon a great many economical problems of the day in his country, and earned thus a considerable reputation as politician and practical economist.

The following list of his publications will give an idea of his activity:

Intorno alla ricchezza pugliese, Bari, 1858; *Il mondo civile e industriale nel secolo xix.*, Napoli 1857; *Dell' industria asiatica*, Napoli 1857; *Della protezione e del libero cambio*, Napoli 1858; *Della proprietà intellettuale*, Napoli 1858; *Delle condizioni economiche e morali delle classi agricole* (published by the Accademia Pontoniana), Napoli 1859; *Dell' educazione alle arti e mestieri*, Palermo 1859; *Progetto di perequazione dell' imposta fondiaria per tutto il regno d' Italia*, Torino 1863; *Il credito fondiario e agricolo*, Torino 1863; *La legge dell' affrancamento del Tavoliere di Puglia e gli interessi economici delle provincie meridionali*, Torino 1863; *Il Passato, Presente e l'Avvenire della pubblica amministrazione del regno d' Italia*, Firenze 1865; *Disarmonie economiche*, Firenze 1865; *La finanza italiana nel 1867*, Firenze 1867; *Relazione sullo stato del materiale e sull' amministrazione della r. marina*, Firenze 1867; *Le due scuole economiche*, Firenze 1875. M. P.

CESS. The land-tax of Scotland, permanently fixed at £47,954 per annum, subject to a power of redemption. It is payable partly from burghs, and partly from shires; the incidence of taxation is determined by the local authorities.

A. D.

CESSIO BONORUM. See BANKRUPTCY IN SCOTLAND.

CESSIONARY (Scots law term). ASSIGNEE.

CEVA, GIOVANNI, born in the province of Milan in 1647 or 1648—is a remarkable author, and will probably attract a growing interest, as the first clear-sighted and decided mathematical

economist. He has also the merit of clearly defining *hypothetical* economics and insisting on *pure* economics as being the only possible exact science of which the subject permits the construction. He was by profession a mathematician and hydraulic engineer, and as such was several times employed by the government of Mantua. His death took place during the siege of Mantua in 1734.

Ceva's economical work has the following long title—*De re nummaria, quoad fieri potuit geometrice tractata, ad illustrissimos et excellentissimos dominos Præsides, Quæstoremque huius arciducalis Cæsarei Magistratus*, Mantuæ, 1711.

He divides the causes influencing the value of money into two groups: those which "extrinsecus adveniunt" and those which "ex nummo ipso procedunt." The "valor externus omnis rei nummarie" varies in a direct ratio to the population and inverse ratio to the "quantitas rei." When "nummi ærosi" and "cupræi," are in excess of the quantity needed for small transactions true coin gets appreciated and *vice versâ* . . . "in eadem quantitate nummis aureis persistentibus eorum externi valores componuntur ex ratione quantitatum ærosæ monetæ et ex reciproca quantitatum argenteæ. As to the causes of variations in value classified as depending "ex ipso nummo," he enumerates the principal ones which can be called expenses of production, viz., the distance and nature of the mines, the expenses of coinage, etc.

Passages characterising his conception of economic science and his condemnation of inductive methods are the following: *Magnum aliquid est commercium illud reconditum atque complexum, quo humana respublica, pecuniæ occulto gyro, florens atque incolumis perpetuo servatur; . . . sed huiusmodi naturam explorare difficillimum est, nec aliter possumus, nisi quædam geometrarum modo ponantur. Alias necesse est nos versari in quadam obscurissima nocte, nec de re huiusmodi posset quidquam constitui neque cognosci. . . . Quibusdam petitionibus præfixis, sic rem intellectui proponemus, ut si fieret, quod ratio admonet fieri debere, geometricæ ostendi possit, unde oriantur augmenta monetarum, et quot quibusque ex rationibus componantur valores ipsi nummorum. Quamvis plura contingant, quæ proxim minus exactam reddunt, regula tamen eiusque vis fixa atque immobilis perseverat.* M. P.

CHADWICK, SIR EDWIN. This distinguished economist and statistician was born in 1800 and died at his residence at East Sheen, Surrey, on the 5th April 1890. He preserved his untiring energy and enthusiasm to the end of this long term of ninety years, and happily lived to see a vast degree of success resulting from the great social reforms he had instituted, fostered, and practically carried through to the advantage of the health, well-being, and general

improvement of his country. Born of a Lancashire family of the middle class, and with immediate ancestors gifted with little riches but with much earnestness of purpose, he had to work out his own way to fortune. Intended at first for the bar, Chadwick was soon forced to change his legal reading for the more immediately bread-winning occupations of reporting and review writing. A contribution of his to the *Westminster Review*, in 1828, on the subject of "Life Assurance," and another on "Preventive Police," gained him the acquaintance and support of Grote, the elder and younger Mills, and Bentham. Soon after the call to the bar of Chadwick, Bentham engaged him as an assistant to complete his own celebrated treatises on civil and penal legislation, and in this capacity Chadwick went to reside with the octogenarian philosopher until his death in 1832. Bentham left him a legacy and a small library, and would fain have wished Chadwick to have succeeded him in the propaganda of what may be called Benthamism. Fortunately Chadwick preferred a practical to a speculative career. National, social, and sanitary subjects, such as the condition of labour, the housing, living, and over-crowding of the population, and especially of the working classes, the improvement of the water supply of great cities, the interment of the dead in cemeteries removed from the immediate neighbourhood of the living, and other similar great questions, had become Chadwick's earnest study. His well-earned reputation for this soon led to his being offered and accepting official employment. In 1832, during the administration of Lord Grey, the first poor-law commission was appointed, and Chadwick's duty, in the post of assistant-commissioner to which he was promoted, demanded his personal visit to all parts of the country where investigation of facts seemed needful, and his collection of them led to such astounding revelations of the then condition of the labourer, of the poor, and of the evils to be remedied, that the government, impressed with the talent and genius displayed in his reports, appointed him a commissioner. The commission itself, of which Chadwick was the real heart and soul, carried out the most sweeping reform in the old English Poor-Law system. Even this was not sufficient to satisfy his almost perverted imagination of view of the advantages to be expected from a root-and-branch substitution of complete centralisation, in place of the excessive and costly decentralisation and its many abuses that were rampant when each of the 16,000 parishes of England looked to the wants of its own poor much in its own way. In 1843 Chadwick had the chief share in drawing up the report upon the condition of pauper children which led to the Ten Hours Act. In 1844 he was appointed secretary to

the new poor-law board, and during his tenure of that office for about twelve years his exertions for the public good were unceasing. In 1838 he presented a report of the commissioners on a special inquiry into the local and preventable causes of disease, and the improvement of habitations in the metropolis. This report proposed a venous and arterial system of water supply and drainage for the improvement of towns, and works for the application of sewage to agricultural production. Similar inquiries were pursued throughout England and Wales under his guidance, and led to very substantial reforms. His report of 1843, on the results of a special inquiry into the practice of interments in towns, formed the basis of the legislation which substituted a better system. In the same year he read to the Royal Statistical Society of London a paper on the best mode of representing by returns the duration of life and causes of mortality. In 1844, Chadwick suggested to Sir Robert PEEL the appointment of a Commission to make a general investigation into the national health and the best means of improving it. Quarrels ensued between Chadwick and the other commissioners, and the new poor-law board was dissolved. It was not perhaps to be expected that a man of the enthusiastic and optimistic type of Chadwick could steer clear of conflict with his colleagues. Nor can it be said with truth that there existed no well-founded cause of complaint on their part, for Chadwick was egoistic and dogmatic even when not positively domineering, and was gifted with a readiness of pen and a volubility of tongue which often wearied out his opponents. But as great public benefits often accrued from his contentions, the private evil to his colleagues does not count for much. Socially, as we and many of his survivors can vouch, Chadwick was a most interesting and valued acquaintance. The fact is that the necessity for speedy action to remedy evils glaring and grievous was so obvious that the urging of them on in a nation wedded as we are to a long retention of old forms and ways and systems, was a positive public good; and, in the case of Chadwick, the man was fortunately equal to the work. Sometimes, indeed, on occasions when he had to stir up apathy or LAISSEZ-FAIRE into reform, he was in the habit of profusely spicing his statements with statistics which would not bear the test of strict actuarial investigation, and which were incorrect in respect of their collocation with results, or of their comparative percentages. The year after the poor-law board was dissolved Chadwick was appointed one of the commissioners to inquire into the health of London, and in the next following year (1848) one of the commissioners of the general board of health, for improving the supplies of water, and the sewage, drainage, and cleansing of great towns. In the same

year he was nominated to the Companionship of the Bath, although he was not promoted to the knighthood of the order until 1889, the year before his death. When the board of health was dissolved, Chadwick retired upon a pension of £1000 per annum. But there was no retirement by him from the active pursuit of his life-long researches and labours for the practical advancement of all that concerns the health and educational and social progress of the nation. On sanitation especially he continued to be its chief authority to consult. He had much influence in such matters, for example, in the sending out of commissioners to the Crimea for the relief of our soldiers there. This was followed up in 1858 by inquiries into the heavy mortality amongst the troops in India, a subject he fully explained in a paper, "On the application of Sanitary Science to the protection of the Indian Army," read before the Social Science Congress at Liverpool. In 1860 he was vice-president of the public health department of the meeting of the same congress at Glasgow, and delivered a remarkable address on sanitation. In 1861, he followed up the same subject, as president of the section of economic science and statistics, at the health association at Cambridge. It would be tedious to prolong the list of his contributions, from 1861 to 1890, to the journals of all the numerous scientific societies to which he belonged, and for whose researches and practical public objects he continued to labour to the end of life. A long career thus well spent deserves the gratitude alike of his contemporaries and of posterity. England certainly has erected statues and memorials of many men of far inferior worth to Chadwick. There remains, however, an ever-present memorial of him in the improvements that have taken place in this country in almost every direction that he laboured in, and which are briefly indicated in the present outline of the chief points in his biography.

See *The Health of Nations, a Review of the Works of Edwin Chadwick, with a Biographical Dissertation*, by B. W. Richardson, 2 vols., 8vo, London, 1887. Chadwick's papers, printed in the *Journal of the Royal Statistical Society*, extend over a period of thirty-six years. Their titles are—"On the best mode of representing by Returns the Duration of Life and Causes of Mortality," vol. vii. p. 1.—"On the Economical, Social, Educational, and Political Influences of Competitive Examinations, as Tests of Qualification for Admission to the Junior Appointments in the Public Service," vol. xxi. p. 18.—"On the Progress of the Principle of Competitive Examination for Admission into the Public Service, with Statistics of Actual Results and an Investigation of some of the Objections raised," vol. xxii. p. 44.—"Results of Different Principles of Legislation and Administration in Europe; of Competition for the Field as compared with Competition within the Field of Service," vol. xxii. p. 381.—"Post-

Office Savings' Banks," vol. xxiv. p. 519.—Address as President of Section F. ("Economic Science and Statistics") of the British Association, October 1862, printed, vol. xxv. p. 502.—"On the Subject Matters and Methods of Competitive Examinations for the Public Service," vol. xxvi. p. 72.—"Poor-Law Administration, its Chief Principles and their Results in England and Ireland as compared with Scotland," vol. xxvii. p. 492.—Opening Address, as President of the Department of Economy and Trade, at the Meeting of the National Association for the Promotion of Social Science, York, 1864, printed, vol. xxviii. p. 1.—"Treatment of Pauper Children on a Larger Scale," table illustrative of school organisation for reducing expenses with increased efficiency, vol. xliii. p. 245. F. H.

CHAFFER, now a verb, was originally a noun, and meant a journey for the purpose of buying and selling, from the words *chap* (as in *kaufen*, *carpo*, *κάπηλος*), and *fare*, a journey. Chap appears in chapman or merchant, also in cheap, which was at first a noun, and meant simply market, as in Eastcheap, and Cheapside. Articles sold on terms favourable to the buyer were to him "good cheap" or good market (compare "bon marché"). The adjective was dropped and the substantival character forgotten; hence the adjective "cheap." Chaffer in popular language is a form of what Adam SMITH calls HIGGLING OF THE MARKET, or the disputing of buyer and seller, which is the usual preliminary to the striking of a bargain; but it is used of retail dealers and their customers more often than of wholesale; and is associated rather with petty than with important interests. [See also CHAPMAN.] J. B.

CHALMERS, GEORGE (1742-1825), Scotch antiquarian, historian, and economist, born at Fochabers in Moray, and educated there and at Aberdeen. He afterwards studied law at Edinburgh. He went to America, and practised as a lawyer at Baltimore. Returning home at the beginning of the civil difficulties in 1775, he settled in London. He was appointed, 1786, chief clerk of the committee of the privy council for trade and foreign plantations. His works were chiefly historical and antiquarian, including the well-known *Caledonia*.

His economic works, as their titles suggest, are chiefly statistical, and as such are of the very highest importance; the *Estimate* in particular furnishing the student with valuable information, which, bearing in mind Chalmers's official position, may be deemed more than usually trustworthy. In his *Considerations on Commerce* he deals with more theoretical matters, committing himself to the opinion that the high price of BULLION was owing to the state of the FOREIGN EXCHANGES. It cannot, however, be said that his arguments or facts tend to establish his position.

His economic works were as follows: *The Propriety of allowing a Qualified Export of Wool*

discussed historically, 1782.—*An Estimate of the Comparative Strength of Great Britain during the Present and Four Preceding Reigns*, 1782.—*Opinions on Interesting Subjects of Public Laws and Commercial Policy arising from American Independence*, 1784.—*Observations on the Strength of England in 1696*, by Gregory King, with a Life of the Author, 1804.—*A Chronological Account of Commerce and Coinage in Great Britain from the Restoration till 1810*, 1810.—*Considerations on Commerce, Bullion and Coin, Circulation and Exchanges, with a View to our Present Circumstances*, 1811 (3d ed. 1819).

There is also attributed to him, but on very slender grounds, a small anonymous pamphlet entitled *Useful Suggestions favourable to the Comfort of the Labouring People*, 1795. E. C. K. G.

CHALMERS, THOMAS (born at Anstruther in Fife 1780, died at Edinburgh 1847), the son of a prosperous merchant, and the sixth of a family of fourteen children, was educated at St. Andrews University, and became minister of Kilmany parish 1803. He was at first more attached to mathematics, physics, and political philosophy than to theology; and brought himself into notice by his scientific lectures given at St. Andrews, first for the university and then in competition with it. In 1808 he published *An Inquiry into the Extent and Stability of National Resources*, in connection with the continental BLOCKADE. The doctrines of this pamphlet were incorporated with his *Political Economy* (ch. vi. p. 221 of vol. xix. ed. Collins), under the heading "Limits of a Country's Foreign Trade, and its supposed power to furnish a people with Employment and Maintenance." In 1815, transferred to Glasgow, he carried out his famous voluntary organisation of charitable relief, to show (as he expressed it) the "sufficiency of the parochial system" and the needlessness of a Poor Law. The scheme worked successfully for more than twenty years. Chalmers was professor of moral philosophy and political economy in St. Andrews (1825-1828), and then of divinity in Edinburgh (1828-1843), holding the latter office till the Disruption of the Church of Scotland in 1843, and the formation of the Free Church, in whose service he laboured (both in its college and in its church courts) to the day of his death. It was no doubt a bitterness to him that by aiding this schism he helped to bring about the establishment of a Poor Law in Scotland, which took place in 1845, two years before his death.

In his book on *Political Economy* (1832) his aim is not to develop a body of doctrines but to secure the moral and thereby the economic elevation of society. Political economy, in the sense in which he treats of it, is regarded as aiming at the "diffusion of sufficiency and comfort." Economists and ecclesiastics (he repeatedly says) have stood too much aloof from each other; and for his part he will write

as an ecclesiastic who recognises the value of economics. He follows Adam SMITH and MALTHUS, rather than RICARDO, accepting the "Ricardian" theory of rent with the modifications of Malthus and Perronet THOMPSON, and the theory of population with less reserve than its author ("Population tends to double itself in fifteen years," *Pol. Econ.* ch. xiii. p. 382). Like J. S. MILL (see *Dissert.* ch. ii. p. 183, "Claims of Labour," written 1845) he saw that the theory of population, instead of closing the way to progress, had really for the first time opened it. He regards the theory of Malthus as the *vinculum* between moral character and economic comfort. "By the indefinite control which the collective mind and habit of society have over the element of population, the general standard of enjoyment in a country is capable of being indefinitely raised" (ch. i. p. 44); and, as a matter of fact it has been raised: "The labourers of our day work harder than before but live better than before." "The rate of wages depends on the proportion which the inclination of the people for marriage bears to their inclination for the comforts and decencies of life" (ch. ix. p. 279); and without a Christian education to give self-control progress cannot be assured. The philanthropy of the few cannot save the many from "that most overmastering of all oppressions, the oppression of their own numbers" (*ib.* p. 285). Neither home colonisation (on Dutch or other models), nor emigration, which is a worse alternative, nor a Poor Law, which is worst of all, can do more than cause multiplication and misery. Government can administer justice, but humanity is out of its province (*Chr. and Econ. Pol.*, pref. viii.) He speaks of the fallacy of "finding employment" for the poor. People forget that a manufacture is creative of nothing but its own products; the equivalents of these products must come from elsewhere. The benefit of a FOREIGN TRADE, too, lies simply in the article it brings us; the tea trade gives us tea, and if it were abolished we should lose tea, and nothing more (ch. ii. pp. 63, 67, etc.) Chalmers, therefore, thinks lightly of the loss of foreign markets. In his book on *Christian and Economic Policy* (ch. xxii.) he says quite truly "that the worth of that by which a thing is done is all derived from the worth of that for which the thing is done;" but from that and similar maxims (there and in the *Pol. Econ.*) he argues in a way that would logically lead to the conclusion that it is indifferent to a shopkeeper whether we deal with him or not (see Mill, *Unsettled Questions*, pp. 53 s.g.) He saw that the importance of the home trade had been under-estimated by statesmen like PITT, who idolized foreign trade; but he went too far in asserting that it was the destruction of British trade that made Britain successful against Napoleon (see *Pol. Econ.*, ch.

viii. p. 184). His own ideal is *AGRICULTURE*, as giving not merely "employment" but "maintenance"; as long as agriculture is unaffected, any stoppage of trade is "only a shift, not a subtraction" (*Chr. and Econ. Pol.*, ch. xiii.) In everything except agriculture there may be over-supply, over-population, and over-supply of capital—too many ploughmen and too many ploughs. If either the "appetite for present indulgence" or the "appetite for future wealth" were to become universal, society would lose its balance (*Pol. Econ.*, ch. iv. p. 137). As population follows food, capital follows openings in business; and, where they fail, it becomes *de trop*. Like the *Pyrrhoniasts*, Chalmers considers that all taxes fall eventually on the *NET RENT OF LAND*, and should therefore be placed there directly, and the landowning class, as they bear all the burdens of the country, should have all the political power. He would maintain *PRIMAVENTURA* to prevent "infinite subdivision" of lands, and to secure that the ship of state shall not have more sail than ballast (*Pol. Econ.*, ch. xvi.). He assents to repeal of the *COIN LAWS* and commutation of *TITHES*; but he thinks the good effects will be transitory, the real causes of distress being over-speculation and over-population (*ib.* ix. p. 309). He is against the *FUNDING SYSTEM*, government loans being always, he says, paid twice over by the public, first in the form of high general prices caused by the withdrawal of the capital lent, and afterwards in repayment of the principal to the lenders (*Pol. Econ.*, Append.). Government should raise enough for the year's needs by taxation within the year. Finally, it may be noted that he stands by his order when he refuses to confine the term productive labour to labour that produces material objects, to the exclusion of professional labours like his own.

Perhaps Dr. Chalmers is better known to later economical readers by his phrases than by his doctrines. As he has made current in ethics "the expulsive power of a new affection," so he has given to economics "the margin of cultivation" (*Pol. Econ.*, ch. i. pp. 12, 13, 14).—"Disposable population" (or non-agricultural), "secondaries" (makers of secondary necessities), "rotation" (or transfer as opposed to creation of wealth), were less happy; but, as John Mill says, Chalmers has always "the merit of studying phenomena at first hand and expressing them in a language of his own" (*Mill's Pol. Econ.*, i. v. § 7). Mill was specially referring to the explanation given by Chalmers of the rapidity with which a country recovers from a war in which it has been overrun by the enemy. The reason was not to be sought in any mystical *vis medicatrix nature*, but simply in the everyday fact that the greater part of CAPITAL, fixed as well as circulating, is being constantly renewed by human efforts year by year, and the stimulus of higher gains

than usual will lead to an energetic direction both of the "immediate" and of the "antecedent" labour on the most urgently needed production. "By one revolution of the economic cycle the circulating capital would be nearly restored; and by a few revolutions more the fixed capital would be fully restored, not by the parsimony of successive generations, but by the privations of a few successive seasons" (*Pol. Econ.*, ch. iv. § 13, pp. 140-142). It may be added that our author anticipated Mill in maintaining, against the opinion of Adam Smith, that the *STATIONARY STATE* of wealth and population might be happier than the progressive (*Pol. Econ.*, vol. xx. ch. xv. § 12, p. 26).

CHAMBERLAYNE, EDWARD, LL.D. (1616-1703). His reputation rests on his statistical and descriptive work, *Anglicæ Notitia*, which went through no fewer than twenty revised editions under his name, and was then (1704) continued by his son John Chamberlayne, the last edition being issued in 1755. It consists of three parts, the first relating to history and general conditions, the second to government, and the last to manners and customs. Chamberlayne's work was the Whitaker's Almanack of the period. Its information is varied and detailed, but only in certain cases are the statistics given available for use at the present time. Such statistics are more frequent in the later issues of the work, where reference is frequently made to the estimates of PETTY, DAVENANT, and KING, though even in the early editions the description of the trades and the economic condition of the people occupies a prominent place.

The Rise and Fall of the Late Favourite of Spain, the Count Oliveros, 1632.—*The Present Wars Paralleled, or a Brief Relation of the Five Years' Civil Wars of Henry the Third*, 1647.—*England's wants, or General Propositions probably Beneficial for England*, humbly offered to

the Consideration of all good Patriots, etc., 1667. —*Anglia Notitia, or the Present State of England*, 1669, also other works, educational and religious.

E. C. K. G.

CHAMBERLEN, Hugh. Hugh Chamberlain, Chamberlin, or Chamberlien (born 1664, died 1728), son of a court physician of the same name, was educated at Trinity College, Cambridge. He devoted himself, like his father, to obstetrics, and is said to have practised in France and Holland before finally building up a professional reputation in his own country. But as early as 1693 he took the field as a financial projector. In that year, after vainly approaching the Scottish parliament on the subject, he induced the English House of Commons (Dec. 1693) to submit his plan for a land bank to a committee, which reported in its favour. No effect, however, was given to its recommendations till 1696 (10th Feb.) when Foley and Harley procured an act in favour of the land bank. William was in need of money for his continental war; and the reform of the currency had brought the Bank of England into difficulties of which the goldsmiths and the country gentlemen were inclined to take full advantage. The Bank of England at its foundation in 1694 had lent to government £1,200,000 at 8 per cent; Chamberlain offered to find more than 2 millions at 7 per cent, the security to be a special salt tax, and the subscribers to be incorporated, in recognised rivalry with the Bank of England, for the lending of money on land securities, at 3 to 4 per cent interest, and with paper issues limited for each year to the total amount of the loan to government. The scheme was vigorously pushed, but the subscriptions were not completed within the date fixed by the act of foundation, and Chamberlain seems to have lost money as well as reputation. He retired to Holland in 1699; and after two fresh attempts, still unsuccessful, to recommend his project to the Scottish parliament (1700, 1705) he seems to have quietly resumed his professional work in England, where he died 1728.

Chamberlain's land bank was open to the general criticism that applies to all schemes for the issue of a paper currency based on land securities;—the securities are not speedily and certainly convertible, and they are not everywhere negotiable. But it had special defects of its own. The security proposed was lamentably inadequate. Its calculations were drawn up on its projector's curious idea that the value of an estate is in direct proportion to the length of time from which an income is derived from it. Chamberlain offered, for example, to give eighty years' purchase for a rent charge of £100 for 100 years, from property in land. The market value of the fee simple in those days would have been about twenty years' purchase, or one-fourth of Chamberlain's estimate.

[Macaulay, *History of England*, ch. xx., xxii.—Thor. Rogers, *First Nine Years of the Bank of England* (Clar. Press, 1887), ch. ii.—Anderson, *Hist. and Chron. Deduction of Commerce*, vol. ii. year 1696.—Macleod (H. D.), *Dictionary of Pol. Econ.*, gives a useful list of his pamphlets (art. "Chamberlain").]

J. B.

CHAMBERS OF AGRICULTURE are, in the United Kingdom, voluntary associations for collecting, maturing, and expressing the opinions of persons engaged in or familiar with agricultural pursuits on public questions concerning the well-being of the agricultural interest. All the chambers now in existence have been formed within the last quarter of a century. Their origin may be traced to the general recognition, in the period 1862-1865, of the want of any adequate machinery for ascertaining the balance of opinion among agriculturists, and, in particular, in the last named year, to the absence of official acquaintance with agricultural conditions, and the helplessness and isolation of the farming classes in the face of the disastrous invasion of cattle plague at that date. The functions of these chambers differ from those of the older farmers' clubs and agricultural societies by including discussions on matters of a distinctly political or economic character. By means of the central chamber in London and the intervention of a representative council, opportunity is given to concentrate and focus the separately expressed views of agriculturists, and, where anything like unanimity is found to prevail, for bringing pressure to bear on the legislature in cases of necessity.

The first formed chamber was the Scottish, in 1864. In organisation it differs somewhat from the English chambers by its membership being more closely restricted to actual tenant-farmers or owners farming their own land. While in corresponding association with the central chamber, its business is independently conducted by means of a board of directors in Edinburgh aided by county committees. The English central chamber was projected by Mr. Charles Clay of Wakefield in 1865, and, since its establishment in 1866, its chairmen, chosen as a rule alternately from different political parties, have been among the most prominent or characteristic leaders of agricultural opinion in parliament. The membership of the central chamber embraces leading agriculturists residing in all parts of England, and includes many peers and M.P.'s. The local chambers for the most part are formed for complete counties. In some instances branch chambers reporting to the county chamber are formed. In others an area less than that of a county is chosen as the district of the chamber where special local or market facilities have established an individuality of agricultural character. Recently, in an increasing number of cases, certain farmers' clubs or societies have

become chambers by adding the special debating functions of a chamber to their primary work, and by affiliating themselves with the central organisation. The membership of all the English chambers, which has been placed at over 12,000 persons, includes landowners, yeomen, and tenant-farmers, and other persons engaged in businesses dependent on agriculture. But the strength and activity of the several local bodies varies very greatly. Some are small, and in others, where the numbers are large, much of the work is left in the hands of standing committees of the more active and intelligent members, owing to the practical difficulty of obtaining largely attended meetings among a community so scattered as the farmers. No chamber possessing less than fifty members is recognised by the central association, and the representatives of some fifty-three active and fully accredited chambers now meet the representatives of the central chamber periodically in London in a body known as the Council of the Central and Associated Chambers of Agriculture. Its deliberations are generally accepted as affording a fair index of the drift of agricultural opinion;—and an enumeration of the more prominent subjects dealt with by this Council in the last twenty-five years, will afford the readiest means of appreciating the class of business—political, social, and economic—coming under discussion by the chambers of agriculture.

Partly from the circumstances above referred to in connection with the origin of the chambers, and partly from the events of recent years, no subject has had a greater prominence than that of the repression of cattle disease. Questions of the regulation of the home trade and traffic in animals, the restriction or stoppage of importation from countries infected with contagious diseases, and the treatment of outbreaks of cattle plague, pleuro-pneumonia, and foot-and-mouth disease have been under frequent consideration, and much of the existing successful legislation on this subject, and the policy adopted by successive governments, as well as the altered position of public opinion generally, has been admittedly due to the initiative and pressure of the agricultural chambers.

The incidence and distribution of taxation in rural districts have naturally furnished another important series of questions for the consideration of the chambers. The incidence of rating, the special burdens falling on land, the relief of localities from the entire cost of obligations imposed for national objects, the improvement of our systems of poor-law relief, of valuation and assessment, the management of highways and main roads, and the reform of local government, have all been largely discussed, and effect given in various instances to the views of the chambers. Questions also of imperial taxation, the adjustment and collection of the income tax, the malt tax, and the beer duties have led

to frequent communication between the chambers and the executive government. More recently, and under the pressure of agricultural distress, it has been observed that a disposition exists among some of the local chambers, especially in wheat-growing districts, to raise discussions on the propriety of reverting, in some form, to import duties on competing foreign produce.

The methods for effectively compensating outgoing tenants for the unexhausted value of improvements effected on their farms have been the subject of prolonged inquiries set on foot by practical and experienced committees of the chambers of agriculture, and to these efforts must be ascribed a large share in securing the Agricultural Holdings Acts of 1875 and 1883.

In the last ten years the relations of the railway companies with the agricultural producers have been frequently debated, and legislation has been secured forbidding the preferential railway rates allowed to foreign produce. The chambers have lately been largely occupied in objecting to certain parts of the new schedules of maximum rates proposed by the companies under the revision required by the Act of 1888.

Among the earlier debates of the chambers, the question of amending the game laws was prominent. Legislation in the direction desired was effected in 1880. Various reforms of the existing land laws have furnished topics for debate, especially in the Scottish chambers, while a consolidation of the scattered functions of the government in relation to agriculture has always been a favourite recommendation, and one realised in the new BOARD OF AGRICULTURE (*q.v.*) Apart from the discussion of questions which are more or less matters of controversy, the machinery of the chambers has been used for spreading information on agricultural matters, and in some instances for the promotion of agricultural education and the conduct of practical experiments.

P. G. C.

CHAMBERS OF COMMERCE, or at least bodies similarly named, flourished on the continent before their rise is noted in Great Britain. One at Marseilles is reported as existing in the 14th century. Chambers in several of the chief cities of France are mentioned early in the 18th century. It would appear that these bodies were suppressed in France in 1791, but restored by official decree in 1851. The foreign type of chamber has, in its quasi-official character, always differed from the purely voluntary form of association for promoting trade interests, recognised as a chamber in the United Kingdom. One of the earliest chambers here is that of Glasgow 1773. Edinburgh possessed a chamber in 1785, Manchester in 1820, and Hull in 1837. Originally chambers were formed with purely local objects, as the promotion or protection of particular businesses. A federation of individual chambers of commerce for concerted action on common sub-

jects of general interest was, however, suggested at a meeting of the Social Science Association in 1859; in the following year what is now known as the Association of Chambers of Commerce of the United Kingdom held its first annual gathering. The chambers of Belfast, Birmingham, Bradford, Glasgow, Gloucester, Hull, Kendal, Leeds, Liverpool, Norwich, Sheffield, Southampton, Staffordshire potteries, Wolverhampton, and Worcester, took part in this movement, Coventry and Dundee being also in communication with the central body. Some of the larger provincial chambers have not joined or have not continued their association with the central body. Manchester, Liverpool, Glasgow, and Edinburgh thus occupy at present wholly independent positions. But the formation of local chambers and their affiliation with the central association has proceeded rapidly; twenty-seven bodies being thus connected in 1865, forty-six in 1873, and sixty-seven at the present time.

The London chamber of commerce, although one of the most recently formed, and dating only from 1881, is naturally the largest existing chamber, with a membership of over 2800, individuals and firms, and an annual income of £6000. According to a table lately published the entire membership of the chambers of commerce numbered some 12,294 persons, with a disposable income of nearly £20,000. Their size and relative importance, however, vary very greatly. Only six recently possessed as many as 500 members, while eleven chambers had less than 50 members, that of Newark being credited with 18 only, Goole with 25, Birstall with 30. In the case of the larger bodies such as Manchester, Glasgow, and Liverpool, the work of each chamber embraces different interests and is divided into three or four tradesections; the smaller chambers usually exist in towns where there are but one or two prominent trades of which a single general committee can be made fairly representative.

In the case of the London chamber a more general sphere of duties is necessarily entered on than is attempted elsewhere. Besides possessing direct relations with seventeen separate affiliated associations, among which very important special bodies like the institute of bankers, the London corn trade, London timber trade, ship-owners' societies, etc., are represented, there are here some twenty organised "trade sections." Separate provision is thus made for the East Indian, the Canadian, the Australian, and the African trades, the metal, textile, provision, and many other groups of businesses. To an extent unknown among the older chambers, the London chamber endeavours to collect and disseminate statistical and other information, and to promote, by the holding of public conferences and lectures by distinguished explorers and others, a knowledge of new openings for foreign trade.

The services of the commercial chambers have been made practically useful in cases of mercantile arbitrations. Their advice has been frequently sought on specific points by the government, and at their suggestion much additional information is now obtained from consular representatives abroad and circulated widely.

It may be interesting, however, in further illustration of the range of business, to quote a few of the earliest and of the most recent topics of debate in the biennial meetings which take place of the delegates of these chambers in the central association. But when it is remembered that as many as sixty different topics have been occasionally disposed of, besides purely formal business, at a single three days' meeting of the central association, it will be seen that no enumeration of the functions of these bodies can pretend to be exhaustive. Among the subjects prominently recurring in the earlier years of the association's existence, and still in some form under discussion in 1886, 1887, and 1888, may be named the improvement of the laws of bankruptcy and of partnership, of legal and county court facilities, of the extension of postal and telegraphic facilities, and the bearing of foreign tariffs and consular arrangements on British trade, as well as a numerous group of questions of internal taxation, shipping dues, local tolls, and assessments. Discussion on patent-law reforms, on uniformity of weights and measures, and on tribunals of commerce were perhaps more notable in the earlier years, while debates and suggestions on the regulation of railway charges, on the constitution of a ministry of commerce, or on improvements in parliamentary and private bill procedure, come more frequently under notice in the later years. In the past quarter of a century, during which the machinery of these chambers has been more especially developed, many results of the action of their executive council and of the discussions at their local and central meetings may be traced in the various acts of parliament passed within recent years for the advancement and regulation of commercial interests.

To illustrate the class of subjects with which chambers of commerce actually deal, we may remark that a list of the business transacted under the auspices of the London chamber alone, in the past eight years, embraces the following numerous and varied items:—The Anglo-French Treaty negotiations, affairs in Burmah, Postal and Telegraphic Rates, Coffee Adulteration, Bills of Lading Reform, Bankruptcy Law Reform, the Suez Canal, the Anglo-Spanish Treaty negotiations, the Coal and Wine Dues, Arbitration and Codification of the Laws relating thereto, Dock Charges, the Congo Treaty, Thames Communication, Railway Communication and Extensions in India and the Colonies, Home Railway Rates and Fares, Indo-Chinese Railways as projected by Messrs. Colquhoun & Hallett, the development of South

Africa, the London Corn Dues, Commercial Treaties with Foreign Countries, Sixpenny Telegrams, Colonial and Imperial Federation, Emigration, the Merchant Shipping Bill of 1884, Trade Marks, the preparation of Average, Wages Tables, the questions of the Royal Commission on Depression of Trade (to which the Chamber replied), the organisation of the Congress of Chambers of Commerce of the British Empire (which was carried out by the Chamber), the Colonial and Indian Exhibition of 1886 (in which the West African Court was initiated by the Chamber), the State Guarantee of War Risks, Code Telegraphy, Technical and Commercial Education, Protection from Fire in London and Fire Insurance Rates, Codification of the Factors' Acts, Canadian Preference Claims, Commercial Museums, the Imperial Institute, the Silver Question, the Shop Hours' Regulation Bill, the Baku Petroleum Conference, Decimal Coinage, Post Office Investments, Colonial and International Exhibitions, Income tax, the Japan and Franco-Chinese Treaties, the Merchandise Marks Act, 1887, and the Submarine Telegraph Monopoly.

P. G. C.

CHAMBRE ARDENTE. This name, though most commonly used in relation to occasional tribunals erected in France for the examination of persons accused of heresy or poisoning, was applied to all extraordinary commissions, established outside of the ordinary course of law, for the trial of alleged criminals of whatever kind. Thus the student of the economic history of France will find the title given to the commissions appointed in the reign of Louis XIII., and under the regency, to inquire into the frauds of the farmers of the public revenues and to enforce restitution of their unlawful gains. Accordingly Littre, in his French Dictionary, gives as the more recent meaning of the term "commission nommée pour connaître des malversations de deniers publics, etc."

[See also *Dictionnaire de la Conversation et de la Lecture*, tome xiii., under the head "*Chambre*," and H. Martin's *Histoire de France*, Index, s.v.]

J. K. I.

CHAMILLART, MICHEL DE (b. 1653, d. 1721). After filling several minor positions Chamillart, by favour of Madame de Maintenon, was set in 1695 over the school at Saint Cyr,—then a recognised stepping-stone to high office in the state. Appointed controller-general of finance in 1699, and minister of war in 1701, he combined for seven years the rôles which, taken singly, had taxed the respective energies of Colbert and of Louvois. Without aptitude for either office, he wore himself out to little purpose. According to Montyon (*Particularités sur les ministres des finances*, 1812, p. 87), the last argument always appeared to Chamillart the most convincing, so that his studies were filled with unexecuted draughts, referred alternately to their promoters and their critics. The popular songs of the day, probably influenced by the necessity of rhyming his name, represent him as the king's boon companion at

billiards—"a hero at billiards, a zero in the ministry," etc. His want of administrative ability was well known to the public, and he frequently appealed to the king to be relieved from burdens which he felt unable to support. But the Grand Monarque, who had said *L'État, c'est moi!* had encouraged Chamillart to assume office by the promise "I will second you," and still flattered himself that he could train a minister or repair his deficiencies. Chamillart was, therefore, retained in office until, in 1708, he resigned the ministry of finance, and a year later, having given umbrage to Madame de Maintenon, was called upon to quit the ministry of war.

Historians are agreed as to the personal probity and amiability of Chamillart, no less than as to his ineptitude. His term of office, however, included a period of seven years' disastrous war, during which desperate expedients were almost forced upon a financier of less than the highest ability. The measures of Chamillart are examined by the judicious Forbonnais (*Recherches et considérations sur les finances de France*, 1758, ii. 104, 109-171), who gives him credit for establishing a special council of commerce to deal with state matters of industry and trade. It was by Chamillart that Boisguillebert was deprived and punished for publishing his *Factum de la France*, 1706.

[For some graphic touches descriptive of Chamillart see the *Mémoires* of his friend St. Simon.—Vuitry, *Le désordre des finances à la fin du règne de Louis XIV.*, 1885, pp. 138 seq., emphasises the ruinous nature of his makeshift finance.]

H. H.

CHAMPART. The right of the feudal lord in many parts of France to receive a fixed share of the tenant's produce. It was collected after the ecclesiastical tithe, and the proportion varied in different districts according to custom or agreement. Sometimes it was a fourth or a fifth, but occasionally it was as little as a twentieth. The lord's share is known by the various names of *champart*, *agrier*, and *terrage*.

R. L.

CHAMPION AND SEVERALTY. The change from champion, or the system of common lands and common cultivation, to severalty was the first act in the history of enclosures, the second act in which took place in the reign of George III. The first period, during which the tendency to enclosure was denoted by the terms used above, consisted chiefly of the reigns of Henry VII., Henry VIII., and Edward VI., though it must not be supposed that it was rigidly confined within these boundaries. Two movements may be detected on a close examination. The first, the turning of arable into pasture land; the second, the "violent inclosure of commons without just recompence of them that have right to common therein" (Stafford's *Brief Conceit*, N.S.S., p. 41). But both these move-

ments were denoted by the term enclosure, and it was into their common action that a commission of inquiry was appointed in 2 Edward VI. By enclosure, said John Hales, is meant "when any man hath taken away and enclosed any other man's commons, or hath pulled down houses of husbandry and converted the lands from tillage to pasture" (Strype, *Eccles. Mem.* ii. pt. ii. p. 362, cf. *Brief Concept*, *ut supra*). The nature of the change is not hard to understand. The effect of the BLACK DEATH (*q.v.*) had been to materially accelerate the dissolution of old habits of cultivation and the introduction of a system of pecuniary payment in place of the interchange of dues and privileges. Leases had been granted, and the semi-feudal ties connecting landowners and labourers were snapped. There was another change in progress of importance equal to this. Though towns and hamlets dependent on husbandry were decaying (Strype, *ut supra*, p. 352; Stubbes, *Anatomic of Abuses*, p. 116), the more mercantile communities were rising in wealth. The era of trade and manufacture was opening. We begin to catch glimpses even of the system of concentrated industries (or those organised in large establishments). The effect of this system was, however, felt forcibly only towards the close of the Tudor period. During the earlier reigns, though trade was developing, its progress was not evident enough to be recognised as mitigating the suffering consequent on so great a change as that described. Other causes served to heighten the discontent, while it intensified the real suffering. There was continual debasement of the coinage. Prices were changing, and all prices, *e.g.* the prices of labour and commodities, did not change at the same time, or in the same rate (*v. The Brief Concept*). Again, the dissolution of the monasteries left the poor without their most common source of relief. Thus it came about that the change from champion into severalty, while necessarily a source of distress, was but one, though by far the greatest, of several changes leading to social disorganisation. Such is the position to be assigned to it as an influential event of the 16th century.

Viewed in its relation to the after history of England, in connection with the later repetition of the policy of enclosure, its results are important indeed. They may be summarised as follows:—(1) Large ownerships in land encouraged, small ones discouraged; (2) the yeoman class deprived of its importance; (3) consequent tendency on the part of those with small fortunes to occupy themselves in trade rather than in agriculture.

[Harrison, *Description of England*.—Stafford, *Brief Concept of English Policy*.—Starkey, *England in the reign of Henry the Eighth*.—Lattimer's *Sermons*.—Tusser, *Five hundred points of Husbandry*.—Stubbes, *Anatomic of Abuses*.—

E. C. K. G.

CHANGE. Abbreviation for EXCHANGE (*q.v.*)—(1) The meeting of bankers and merchants for the transaction of business; (2) the place where they meet. In London there are separate exchanges for the various classes of business. The Royal Exchange is used alternately for transactions in foreign bills and for business in drugs and chemicals, and there are, besides the stock exchange, the corn exchange, the metal exchange, the hop exchange, the wool exchange, the coal exchange, etc. The "Commercial Sale Rooms" in Mincing Lane and the "Baltic," though not called exchanges, are used for similar purposes.

This word is also used for small coins, etc., given in exchange for one, or perhaps more, coins or notes, and in the aggregate of similar value: the balance returned in cash when goods of one value are purchased with money of a greater value. One of the advantages of the cheque over coins or notes of specific amounts is that it can have assigned to it any required amount, and that *change* is rendered unnecessary.

E. S.

CHANGE (AGENTS DE)—the official name of the licensed brokers who possess in France the exclusive privilege of negotiating the purchase and sale of public securities. As early as the 16th century the State exercised a control over the business of *courtier* or broker for the exchange of money or merchandise by requiring agents to obtain letters of license. The next step was to limit the number, to exact payment for the monopoly, and to fix the rates of brokerage. At one time the exercise of the office was hereditary. In 1720 the two branches of the profession were separated, the name of *courtier* being reserved for brokers in merchandise, while that of *agent de change* was created for intermediaries in letters of exchange and moneys. A great number of decrees and ordinances regulating the privilege were issued down to the Revolution, when the business of agent de change was made free, but after the re-establishment of order the monopoly was revived, and the privilege was affirmed by art. 76 of the Code de Commerce promulgated in 1807. A law of 1816 fixed the number of *agents de change* in Paris at sixty, and conferred on them the right to nominate their successors, subject to the approval of the corporate body and the Minister of the Interior. As their number has since remained unchanged, the value of the office has increased with the immense expansion of business. The first transfer made was for a premium of £1200, but the purchase price has since risen as high

as £90,000, although it varies with the standing of the holder of the office transferred, the amount of business transacted by the different *agents de change* being very unequal. Sleeping partners generally supply the greater part of the capital, the nominal holder contributing the business qualifications, which are to have been employed not less than four years with an *agent de change*, a banker, or a public notary. Besides the various laws relating to *agents de change*, which were codified by a decree of 7th October 1890, in eighty-four articles, the discipline of the body is exercised by an elected council called the Syndical Chamber, in each town possessing a bourse. Members are forbidden to operate on their own account; they are bound to secrecy as to the parties for whom they are acting, unless with their consent, or the nature of the operation justifies a departure from the rule; they cannot refuse to execute orders, nor can they form associations with each other in the exercise of their profession; they are liable for the regularity of the securities they deliver; and they are bound, by a recent decree, to give receipts for the money or securities they receive. Although not legally obliged, *agents de change*, in Paris at least, guarantee in common the liabilities of their members in their professional engagements, and possess a fund for the purpose. They meet at the close of each market and draw up the official price current for the day. The syndical chamber decides, subject to the approval of the Minister of Finance, on the admission of new securities to official quotation. The number of *agents de change* in Paris, not having been increased since 1816, is quite insufficient for the present volume of business, and they have abandoned dealings in coin and bullion and bills of exchange, which they formerly transacted and which properly belong to them. The same cause has led to the rise of an outside market, unauthorised but tolerated, called the COULISSE (*q.v.*)

T. L.

CHAPMAN. A person engaged in trade or commerce; a merchant. Up to the Tudor period it is impossible to discover any distinction in the use of the two words chapman and merchant. Chaucer, *e.g.* in the "Man of Law's Tale," and in the "Shipman's Tale," uses the two words indifferently. The returns for the poll-tax of 1379 in the West Riding of Yorkshire show that the chapman is on the whole a less important and wealthy person than the man described as a merchant or mercator, but there is nothing in the documents to show that the "marchand de bees," or cattle dealer of Pontefract, who pays a tax of 2s. is in any superior or different position to his fellow townsman who calls himself a "chapman de bees" and also pays 2s. It is not until the great expansion of commerce in the 15th and 16th centuries that the word chapman is definitely restricted to the small pedlar or retail

dealer. The transition is markedly seen in the act 5 & 6 Edward VI. c. 21, in which one of the terms used for pedlar is "petty chapman." By the 17th century the distinction between the chapman or small trader or pedlar and the merchant was firmly established. In modern times chapman is only used as an antiquarian or romantic synonym for merchant, or in certain districts as the local name for pedlar.

Besides this signification of seller or merchant, the word was frequently used in the converse sense of purchaser, a usage still to be found in some dialects.

C. G. C.

CHARGING ORDER. Where a judgment has been entered up in any of the superior courts against a person interested in any government stock, funds, annuities, or stock or shares in any public company, a "charging order" may be obtained from the court by the judgment creditor to the effect that such stock, funds, etc., shall be charged with the payment of the amount for which judgment was recovered. The effect of a charging order is to entitle the judgment creditor to all such remedies as he would have been entitled to if such charge had been made in his favour by the judgment debtor.

[Daniel's *Chancery Practice*, 6th ed. London, 1882.—Wilson's *Judicature Acts*.] J. E. C. M.

CHARITABLE FOUNDATIONS. These may be defined as "gifts to a general public use, which extend to the poor as well as to the rich" (Lord Camden). A charity is said to be constituted by "any legitimate dedication of property upon a trust, whether express or implied, capable of permanent duration for the benefit, whether they be rich or poor, of the public, or a class of the public as distinct from individuals" (29th Report of Charity Commissioners, 1882). To such foundations the state has always stood in a peculiar position. It has, in England, maintained that they required especial care, partly because, like infants and lunatics, they are *inopes consilii*, partly because, owing to their permanence, they are liable to every kind of vicissitude, and partly because those who administer them have not that inducement to good management which self-interest gives in private business. This attitude on the part of the state implies two things, *first*, the duty of protecting, *secondly*, the right of controlling. Both of these are necessary that the foundation may be administered and applied to promote the charitable intent of the founder, or as near as may be; which last proviso has given rise to the doctrine of *cy-près* which is set forth in the celebrated Campden case (Law Report, 18 Ch. Div. 310).

The Court of Appeal here laid it down that it is the duty of the state to review the means which the founder of a charity has prescribed for carrying out the general intention of his foundation, whenever those means, by reason of changes which may take place either in the value of the endowment, in the circumstances of the locality or the population for the benefit of which the charity is administered, in the times, in the habits of society, or in the ideas and practices of men, have become unfitted to secure the end which the founder had in view. This position is illustrated by—(1) trusts for apprenticeship, where the end is to give the objects of the charity such an education as will enable them to gain their livelihood in an honest and respectable manner; and (2) doles, a "practice," says Sir G. Jessel, "which should be more honoured in the breach than in the observance," which may be turned into permanent pensions or used for any method of promoting thrift. These objects were originally carried out by the courts of equity, a method of procedure which proved to be irregular, costly, dilatory, and to give great openings for fraud. The state of things became so little satisfactory that in 1818 a commission was appointed, commonly known as Lord Brougham's Commission, to inquire into the state of the charities of England, and sat, with various changes, until 1837. In 1835 and 1849 committees of the House of Commons were appointed to deal with the results of its labours. Ultimately, in 1853, a permanent charity commission was appointed with a two-fold aim: viz. (1) to supplement the means provided by founders, where those means were inadequate, to give full effect to the purpose of the foundations; (2) to protect the property of charities against waste and loss, and so preserve it for the purpose to which it had been dedicated by the founders. These objects the commissioners have continued to discharge down to the present time. In the year 1870 the work of the endowed schools commissioners was transferred to the charity commissioners, and in 1883 under a special act of parliament (46 & 47 Vict. c. 36) a department was formed to supervise the administration of the city parochial charities. It was hardly to be expected that the powers of the commissioners could be exercised without a considerable amount of friction and of adverse public criticism. The friction has arisen between the central board and the trustees and other local administrators of charitable funds, but the line between the spheres of the two bodies is clearly marked. It is for the local body to administer the charity, i.e. its annual income, the duty of the commissioners is to secure its permanence; they and they only are the judges of all applications of its capital, and of the prescribed mode of giving effect to the objects of the charity. It is enough to say of the criticism that it is not

uncommonly the result of ignorance, prejudice and disappointed self-interest, or of a strong local feeling which has for a time obscured the judgment. The total number of charities registered by the commissioners was on 31st December 1889, 31,350, and the funds invested in their name amounted to £14,497,836 in 15,511 accounts.

It is quite clear that whatever be their origin or their aim, charitable foundations will have considerable economical effects. (1) They will determine for long periods of time the employment of considerable amounts of property. In the case of real estate the accumulation in the hands of charitable trustees has been limited by the mortmain acts and by the statute 9 Geo. II. c. 36, but with regard to personal property there is no such limit. (2) The effect of foundations on the habits and character of a population may be very great, as will be best seen by some practical instances. In 1793 George Jarvis left a large property, £100,000 in all, for the benefit of the poor of three parishes in Herefordshire, the united population of which did not exceed 900. The consequences are thus sketched by Mr. Hare of the Charity Commission. "The pauper population increased in ten years upwards of 20 per cent; in twenty years almost 40 per cent; and in thirty years 60 per cent. The cottages became more and more crowded, houses not more than sufficient for one family were divided into two or more, other dwellings were built, some on waste, others on remote spots, with regard to little else than mere shelter. The inhabitants of the country round the parishes, who remember their state some years ago, are uniform in their testimony of the demoralisation of which the poor were by this means made the victims: their mode of existence resembled that alternation of want and repletion which is characteristic of the savage state. Idleness, discontent, and improvidence were found to be the fruits of this ill-conceived and ill-judged gift, to which must be added an immorality of life the results of which are yet distinctly felt." Of the endowed charities of Bristol it is said by the Education Commission of 1861, "these charities, by their operation, are teaching indolence, mendicancy, servility, and falsehood to the poor of Bristol." The judgment of the poor law commissioners of 1834 is thus stated. "In some cases, charitable foundations have a quality of evil peculiar to themselves. The majority of them are distributed among the poor inhabitants of particular parishes and towns. The places intended to be favoured by large charities attract therefore an undue proportion of the poorer classes, who, in the hope of trifling benefits to be obtained without labour, often linger on in spots most unfavourable to the exercise of their industry. Poverty is thus not only collected but created in the very neighbourhood where the benevolent

founders have manifestly expected to make it disappear." These reports, and others of the same nature, suggest the question:—How far it is for the good of a country that the characters of thousands should be at the mercy of one man's folly? By some the answer is made, that all endowments for specific purposes are bad, and that if foundations be recognised at all, they should be determined in their object and method wholly by the state. By others, again, a large increase of the power of interference on the part of a public body, a large discretion as to purpose, and a constant living control are urged. How far this last can be attained is at present very doubtful. In 1869, Mr. Mill wrote, "We have well-nigh seen the last of the superstition which allowed a man who owned a piece of land or sum of money 500 years ago, to make a binding disposition, determining what should be done with it as long as time or the British nation should last," but the anticipation must still be reckoned sanguine. (3) Special effects will be produced by foundations having an educational purpose. Adam Smith in a well-known passage has pointed out that endowments to assist those preparing for the clerical calling had attracted large numbers into it, and so damaged the position and prospects of all (*Wealth of Nations*, bk. i. ch. 10). Other writers have urged that teachers require the stimulus of competition, that students are more productive when their self-interest is involved, that scholarships, bursaries, and the like tend to stereotype lines of study long after they have ceased to be profitable, and give them a great advantage in competing with new and perhaps more valuable subjects. But, on the other hand, it is maintained that by endowments only can variety be ensured, that many subjects could not possibly be studied or taught as a means of gaining a livelihood, that education as a whole cannot be safely left to the action of competition.

L. R. P.

CHARITABLE INSTITUTIONS. Charitable institutions may be classified in various ways. If distinguished according to their objects, they are designed to give (1) permanent help in old age, in almshouses or by pension; (2) permanent help to the incapacitated, in asylums for lunatics, imbeciles, incurables; (3) temporary relief in homes for convalescents,

orphans, cripples, inebriates, hospitals for surgical and medical cases, nurseries for children; (4) educational advantages, in schools for the blind, the deaf, and dumb, for children of all classes and all creeds; (5) miscellaneous forms of help, aids to prisoners, homes to penitents, shelter, drugs, etc. The general supervision of all institutions supported by endowments is in the hands of the charity commissioners (see **CHARITABLE FOUNDATIONS**); the administration is sometimes carried on by trustees, sometimes by representatives of local councils, etc., sometimes by co-opting boards, sometimes, in the case of those supported by subscriptions, by representatives of the subscribers.

The general principle may be laid down that a charitable institution will be useful in proportion as it is an aid and not an obstacle to self-help. But provision for any one of the above mentioned objects on a large scale may check the spirit of provident foresight and thrift. Asylums for the aged may be multiplied to such an extent as to discourage provision for what is an inevitable contingency in life. Many such institutions, again, run the risk of destroying family life, or at least lessening its usefulness. Not only is it difficult to imagine any public institution for children which is not inferior to their home, but the fact is often forgotten that the aged and the young, even the cripple and the bedridden, have their place and use in family life. Parents and children are taught to undervalue their responsibilities when facilities are given for escaping them. Reckless living and early marriage are often encouraged. It is found almost impossible to establish a provident dispensary in the neighbourhood of a great hospital with its free out-patient system. The existence of institutions may also encourage imposture, for to secure their benefits is the aim of the artificial pauper who lives by writing begging letters. Case after case has come to light in recent years in which the benefits of institutions have been the prey of such impostors to the discouragement of every honest and independent man. Again, vice is often fostered by such institutions. The impression is easily created in men's minds that a certain degree of badness is sure to excite compassion, and so the care of children may be evaded or a retreat secured.

These evils can only be avoided by very careful administration, for which two things are needed.

First.—Watchfulness on the part of the managers. Too often boards and trustees are negligent of their business, leave everything to paid officials, and scandals ensue in the management and in allotting the benefits. In many institutions the regulations as to admission are framed with a view to exclusion rather than selection. In some cases admission is gained only by the votes of subscribers—a system which ensures success to those who have influ-

ential friends, and who are therefore in many cases the least in need of help. This system is defended on the ground that subscribers expect a *quid pro quo*, but the experience of institutions which have abandoned it does not justify the argument. Again, watchfulness is needed to avoid waste in salaries, general expenditure, and advertising, and the proportion of income devoted to working expenses often points to the absence of such care.

Secondly.—Elasticity. The objects of an institution may disappear under changed conditions. Almshouses, *e.g.*, which were once the solution of the problem of housing the poor, are now generally condemned. The class for whose benefit the institution was intended may have ceased to exist. Thus in many cities and boroughs are large endowments for the use of freedmen, an entirely different class of persons to-day from those for whom they were originally intended. In all such cases careful reform is needed on the lines of attaining a kindred object to that originally proposed, and the wisest founders are those who leave a complete discretion to posterity.

In general terms it may be said that those institutions are the best which provide (1) for the result of temporary disaster—first-rate medical and surgical skill must always be beyond the reach of the poor, and no amount of foresight on their part can guarantee them such professional aid; (2) for objects which are beyond attainment, owing to the scale on which they are needed, as for instance, large establishments for technical training, libraries, and museums; (3) for those deplorable instances of breakdown in old age, due to no fault of the aged themselves, but to dishonesty of others, or a catastrophe beyond human control. But even in these cases it is difficult to overrate the importance of careful administration.

[For the charitable institutions of England, see Reports of Charity Commission.—*Charities Register and Digest*, by the London Charity Organisation Society (1890).—*Essays on the Principles of Charitable Institutions*, anonymous, 1836.—Reports of Charity Boards, etc., in America are published by the various States.] L. R. P.

CHARITY. "In the minds of all ordinary persons charity implies the relief of poverty." Lord Esher in Court of Appeal Q. B. Law Reports, 22 Q.B.D. 296. But how poverty may be relieved is a question beset with difficulties. *First*, it is almost impossible to avoid weakening the motive to exertion. If a thrifty man finds his thriftless neighbour placed by charity in as good a position as that which he has won for himself by his own industry and self-control, a great discouragement is given to thrift. It is easy to multiply instances of this. Towns with largely endowed charities are almost always full of paupers, and a connection may be traced between the two facts.

The vagrant class is created and maintained by thoughtless charity; the out-patient system in hospitals is fatal to medical clubs; it is found almost impossible to establish a provident in the neighbourhood of a free dispensary. All experience goes to show that men will not make provision for themselves if they know that they can fall back on others. Charity is too often morally as well as economically harmful. *Secondly*, it is difficult to avoid weakening the family tie—parental and filial responsibility. Thus all provision made by charity for the aged will discourage children from doing their duty, the applicants for almshouses and still more for pensions are always in excess of the vacancies; founding hospitals increase the number of illegitimate births and of desertions, whilst their abolition is not found, as was feared, to increase child-murder; facilities given to parents to get rid of their children, on whatever ground—cruelty, neglect, bad surroundings, etc.—will ensure an increasing number of such cases. *Thirdly*, charity, by lowering wages, often inflicts a serious blow on the independent wage-earning class. Persons who are in the receipt of charity are certain, when competing for work, to underbid those who have to live wholly by it; provision by charity for old age will prevent wages from rising to a point which allows of securing it by the labourer's own efforts; to transfer employment or to "make work" on charitable grounds is to tax the independent labourer for the benefit of his poorer competitor; the provision of model-dwellings, etc., by charity at less than cost price attracts crowds of workmen competing for employment. *Lastly*, some miscellaneous evils may be added. Charity often leads to a congestion of population in a favoured district, with all the evil consequences of overcrowding. In country villages the fear of admitting strangers to share in the charities has before now led to intermarriage in a small circle, with disastrous results. Charitable endowments often keep alive useless and sometimes injurious occupations with a view to qualification for their enjoyment,—those which are confined by a religious test become in many cases a premium upon hypocrisy.

The first duty then of those who would relieve poverty without increasing it is that of inquiry into its causes. Poverty may be deserved—the result of non-production from laziness, or reckless consumption, self-indulgence, thriftlessness, etc.;—or undeserved, being either from general causes—the result of commercial depression, failure of crops, hurricanes, inundations, etc., or from personal misfortune—the result of bodily or mental infirmity. Preliminary inquiry on these points will prevent many of the evils of thoughtless charity. It clears off impostors and prevents charity from being the prey of the idle and dissolute; it shows that in many cases charity will do no good,

but rather harm, either because the power of recovery is wanting, or because repeated failures show that some such discipline as that of the workhouse is necessary; in other cases it brings to light elements of hopefulness, it shows grounds for thinking that with timely aid independence may be regained. But inquiry does more than this. It not only gives a thorough knowledge of the circumstances of those to be relieved (character, history, opportunities, etc.), but as a result of such knowledge it gives a clue to the best method of relieving. It is to the charitable what diagnosis is to the physician—it shows who can safely be helped and how they can be most helped.

Nothing is more difficult than to formulate methods of charity, *i.e.* of relieving poverty. It may be questioned whether experience has as yet yielded any but negative results, and the constant changes in the conditions of life forbid any hope of finality—thus though the housing of the aged poor has been a problem for centuries, the old solution, *viz.* the provision of almshouses, is at the present time generally condemned. The following general principles may be laid down—(1) that all charity, to be useful, must be adequate, that is to say it must be sufficient to secure some definite object, or to put the recipient beyond the need of charity. Inadequate charity is worse than useless. The old system of doles illustrated this. People got into debt up to the amount which they anticipated, or not uncommonly wasted the whole in excess. A small sum given to a beggar is just enough to make him go on begging and to give him and others an excuse for doing so. (2) Charity should never be directed to providing the necessities of life. For those who lack them, *viz.* the destitute, provision is made by the poor law. Now the poor law embodies in its regulations, etc., the experience of some of the wisest and most skilled in the relief of the poor. It is very dangerous to attempt to relieve destitution without the safeguards which the poor law provides. It is almost as dangerous to attempt to remedy or deal with the ordinary ills of life. Thus sickness and old age are inevitable for all, and it is the duty of all to make provision for them. To relieve people from the responsibility is to weaken self-reliance and self-control, and so in the long run to increase poverty. Charity therefore, when it deals with individuals, should aim at helping those of whom there is good ground for hoping that they may be restored to independence, those whose poverty is inevitable, the blind, dumb, etc., or those who in old age have been defrauded of their savings, or those whose needs are on a scale which is beyond any power of provision—the result of accident or sickness of a kind requiring special knowledge and skill in treatment. (3) The wisest charity is that which does not wait till poverty is a *fait accompli*

to relieve it, but aims at removing its causes. In individual cases this work is moral rather than economical, it aims at the formation of character by personal friendship, moral suasion, the creation of opportunities, friendly guidance. Material assistance will be best employed in improving the general conditions of life, and that form of charity is least open to objection, under present circumstances, which does not come into direct contact with individuals at all, but seeks to provide on a large scale the conditions of good living, open spaces, museums, picture galleries, etc., the requisites of culture, bodily and mental.

Any such scheme of charity is clearly beyond the power of the individual to realise; both for inquiry and administration some organisation is needed. The question arises whether this should be the work of the state or left to voluntary bodies. Precedents may be found for almost every possible combination of the two systems. In England the spheres of the state and private charity are distinct. The state undertakes the relief of destitution, leaving poverty to voluntary effort.

[Reports of Charity Commissioners (1833 *seq.*).—Publications of Charity Organisation Society, London.—Defoe, *Giving Alms . . . no Charity.*—Walker, *The Original.*—For foreign countries: Twining's *Poor Relief in Foreign Countries*, also Senior, 1835, and blue book, 1875-77.—Schmoller's *Jahrbuch* (series of articles).]

L. R. P.

CHARITY ORGANISATION. Charity organisation is an application of the principle of division of labour to the relief of poverty, with the further object of giving the assistance required by the poor in the manner most beneficial to them, while leading the more prosperous to understand that it is their duty to join in meeting the wants of those in distress. With a limited area and a small population the problems of charity are, by comparison, simple, for the well-to-do know their poorer neighbours, and the conditions under which they live, and so can help them personally. All this is changed in a city with a dense population, a wide separation between rich and poor, a complex social system in which the causes of poverty and its remedies are hard to see; here some organisation among the charitable is needed to ensure greater knowledge, and greater efficiency as a result of knowledge. The knowledge requisite is of two kinds: first, to guarantee that charity is bestowed on fitting objects, and secondly, that it is given in the most useful form. Such knowledge is only to be gained by thorough inquiry, and its value may be shown by examples of the evils caused by ignorant almsgiving. (1) In every community in which charity abounds there will grow up a class of persons who live by it in preference to living by independent work. The

existence and growth of such a class is often the result of ignorance on the part of charitable persons who, whilst striving to mitigate the evils of poverty, increase them by fostering mendicancy, hypocrisy, idleness, and improvidence. In proportion as the charitable act together in some organisation they will avoid creating these mischiefs, for diligent inquiry will prevent the diversion of alms to such recipients. (2) Unless there is some common action among the charitable there is danger of overlapping. Some persons will be assisted by three or four institutions and half a dozen individuals at one and the same time. This danger is greatest when charity is distributed on several different principles, as in England, where we have municipal and parochial charities, charities for members of various religious bodies, trades, and professions, charities for persons suffering from various forms of mental and bodily disease, and the like. Here ignorance of what others are doing causes waste.

It was these evils, amongst others, which the late Edward Denison had in his mind when, in 1869, he gave the impetus which started the London Charity Organisation Society. He desired to establish a union of charities having a registration office in each parish and a central office auditing and controlling the parochial charities. It was to be an organisation of existing charities with a view of checking imposture and waste, and of teaching sound principles in almsgiving; it was not to add another to the sources of help, but to increase the efficiency of those already in existence by their co-ordination. As a result, we have now in London a central committee with district committees in every poor-law union. The central committee does not relieve directly, but aims at propagating sound views on the subject of charity by publication and discussion, promoting co-operation, suggesting new institutions on good principles, collecting information relating to individuals and of general import, and preventing misapplication. The district committees in London, and the sixty-eight affiliated societies in England and Scotland, not only organise, but also administer relief on certain principles. These principles may be summed up as follows: (1) That all relief should aim at making the recipient independent of relief. (2) That no relief should be given without thorough inquiry and investigation. Quite apart from the detection of impostors mentioned above, inquiry is to the charitable worker what diagnosis is to the physician. Nothing short of thorough knowledge can ensure the discovery of the best means of helping; only thus can we see the germs of hopefulness which it is for charity to develop—the grounds for thinking that restoration to independence is possible. Knowledge of the past is necessary as a guide to the future. In the best societies the term “deserving,” as im-

plying that charity should be given on a test of merit in the past, has been dropped. (3) That existing institutions should be utilised as far as possible. Thus a person may be referred to medical or general institutions, to private persons co-operating with the society, to relations or friends; he may also be helped by finding employment, by loan, or a grant from the society's funds. (4) That all relief should be adequate to secure the object with which it is given. If on the one hand organisation prevents overlapping, on the other it secures co-operation—it can bring a number of persons together, and by joint effort do what individuals acting separately cannot. By putting these principles into practice the various societies train workers, promote discussion, and spread knowledge.

The administration of charity in England is bound up with the existence of a poor law (see POOR LAW), and one of the aims of charity organisation is to establish relations with the official forms of relief. It is the duty of the poor-law authorities to relieve destitution, and in administering relief to take into account the amount of destitution and that only. But even among the destitute there are many cases which can be treated far better by the assistance of the charitable than by the poor law,—all those cases, that is, which give ground for hope that independence may be restored. Charity can ensure more thorough inquiry and knowledge; it can induce relations and friends not legally liable to give substantial help; the help which it gives directly is far more elastic, determined by future possibilities rather than by existing needs. Above all, charity can give moral assistance. In many cases, *e.g.* widows left with large families, the poor require not so much material help, as the encouragement and support which sympathy brings (an American society takes as its motto “not alms, but a friend”)—these, together with opportunities for work, openings for children, and the like, can be given by charitable volunteers working together, but they are beyond the scope of an official system. It may be said shortly that in many cases charity can restore independence more quickly, more cheaply, with a smaller risk to family affection and self-respect, than the poor law, whilst at the same time it enforces social duties and binds classes together.

The relations between voluntary and state help differ in different countries. In France, the right to relief is recognised only in the cases of lunatics and deserted children, all other relief may be described as organised charity distributed by public bodies. Institutions, such as *Hospitales* for the sick, hospices for the aged and infirm, are supported by endowments and voluntary contributions, and managed by unpaid bodies constituted and controlled by the state. The Bureaux de Bienfaisance, consist-

ing of elected and nominated members, the Maire presiding *ex officio*, distribute relief in the communes to the poor at their own homes. The funds which they administer are derived almost wholly from endowments and voluntary contributions, a small proportion only coming from taxation. Inquiry is conducted mainly by sisters of charity, and is very thorough. It is claimed for the French system that it combines the efficiency of voluntary effort with the regularity and consistency of official management; it is objected to it that in practice the relief given is rarely adequate. The value of inquiry is illustrated by the case of Elberfeld in North Germany. Here the prevalence of pauperism induced the authorities to enlist volunteer aid very largely. Relief is now administered by 18 overseers and 252 visitors, to each of whom is entrusted on the average 4 cases; as a result, pauperism of all kinds has largely diminished, able-bodied pauperism has disappeared, thrift and providence have greatly increased.

The difficulties in the way of extending organised charity in the United Kingdom lie first in the absence of strictly binding principles. The reports of the various societies show a great variety both of principle and practice. It is with the greatest difficulty that even the local government board, with its statutory limitations and its official machinery of inspection and audit, can secure even an approach to uniformity in administering poor relief; it would be far more difficult to do so with voluntary, uncontrolled, irresponsible bodies. Secondly, granting a general acceptance of principles, and loyalty to them, a difficulty arises from the scarcity of individuals with the skill and experience necessary to apply them. Charity organisation makes way but slowly in the United Kingdom. Charitable persons and the governors of institutions are unwilling to submit themselves to its discipline, and misinterpret its objects and methods; and yet the best hope for improving the relief of the poor lies in supplementing the poor law by voluntary and organised effort.

L. R. F.

CHARITY, STATE. A distinction may be drawn between the supply of the necessities of life, of the minimum, *i.e.* of food, clothing, and

shelter needful to support it, and the supply of sources of comfort over and above these, which technically fall under the head of luxuries, in short, between the relief of destitution and of poverty. The action of the state with regard to the former is determined in this country by the Poor Law (see POOR LAW), we are now concerned with proposals that the state should supply or guarantee certain of the latter. Such action on the part of the state may be conveniently summed up under the head of state charity. The growth of such a theory of the duty or functions of the state is not difficult to trace. The poor-law system guarantees to every citizen the necessities of life, but the conception of these necessities is constantly changing. As Ricardo has pointed out, it differs in different countries, and at different times in the same country. In popular parlance the term "necessaries of life" implies a great deal more in this country to-day than it did a hundred years ago. And, as the conception has grown, so, not unnaturally, the state has come to be regarded in some quarters as responsible for all the individual things which are contained in the new conception.

We must distinguish, *in limine*, two kinds of provision made by the state. There are, first, services common to the nation as a whole, which are open to all alike, and of which all avail themselves, of which it is difficult to say that any individual or any class is more benefited by them than any other; as, for instance, the administration of justice, the guarantee of security at home and abroad, the enforcement of contracts, the means of communication, the medium of exchange. There are, also, advantages accruing to certain individuals or certain classes only, which practically are given by one part of the community to another; such at the present time in England would be free education; it would be provided by one section or class for the use and enjoyment of another, whereas in the United States, it is said, the whole population, without distinction, send their children to the common schools. Free libraries might come under either head; picture-galleries under the first; and baths and wash-houses under the second only. Again, a distinction must be drawn between England, where there is a poor law, *i.e.* provision for the destitute, and countries where there is none. The poor-law system in England is practically the outcome of a drastic reform of a system of state charity which was working untold ill, and many of the proposals of modern times, *e.g.* free dinners, may be treated, and indeed would naturally be treated, as part of the poor-law system, and administered under the safeguards which are embodied in that system as the result of a bitter experience. On the other hand, the attitude of a country towards such a question as GOVERN-

MENT INSURANCE (*q.v.*) may be determined by the presence or absence of a poor law, the arguments pro and con will be of a different kind in the two cases, and even the same arguments will have very different weight.

A few instances will show the nature of state charity. I. *Allotments*. All through history we find pressure put upon the state to "find land" for the poorer citizens. At the present time proposals of this kind are common, as, by 50 & 51 Viet. c. 48, the local authority is empowered to purchase land, by compulsory sale if need be, for the purpose of allotments (see *ALLOTMENT*). Now when the powers granted by this act have been put in force, the question arises as to the terms on which such allotments shall be let, whether at the market value (*a*) as agricultural, or (*b*) as building land, or at any of the thousand-and-one varieties of "fair rent." If they are let at anything under the market rent they come at once under the head of state charity. For the rates then provide for certain citizens advantages which they cannot command for themselves, or, at least, the advantage secured to them from the rates is out of all proportion to their contribution. The question of right—how far, *e.g.*, in country parishes the allotments represent a repair of wrong done by enclosure acts—is outside the economical question which refers to the probable effect of a course of conduct. Now, if a piece of land be let to a labourer at less than its market value, he clearly is benefited to the extent of the difference, in other words, his wages are increased out of the rates. The results of such policy, on a large scale, may be seen in the well-known allowance system. In the long run wages will be lowered by almost exactly the amount of advantage given; in other words, the employer of labour will profit by the fact that a part of his wages bill is paid for him by the whole body of ratepayers. Again, if the experience of the past may be trusted, the results to the labourers themselves will be disastrous (see *ALLOWANCE SYSTEM*). A practical difficulty arises from the fact that it is almost impossible to ensure that the letting of allotments on easy terms shall not be an engine of political corruption. As it is, the promise to procure cheap allotments is fast becoming a favourite device to catch votes at a parliamentary election. In considering this question we must bear in mind that if an open space be acquired out of the rates and let in allotments at its market-value, no charity is involved. The advantage to the ratepayers of an open space may fairly be set off against the difference of value for agricultural and building purposes, and the opportunity given for open-air exercise, &c., is clear gain to the community. II. *Buildings*. A form of state charity which finds many supporters at the present day is the provision

of houses, or sites of houses, for the working classes, by the state. The question involved here is twofold, viz.: (*a*) how far is such action on the whole for the good of the community, and (*b*) how far is it likely to achieve its immediate end. That end, it must be confessed, is most attractive. The moral and economical loss to the nation involved by the conditions under which the poor live—bad air, bad materials, confined space, want of sun, and the consequent habits of ill-health and intemperance—cannot well be overstated. But it must always be borne in mind (1) that an attempt to improve dwellings which is not the result of a rise in the standard of comfort on the part of the occupants is not likely to have a lasting success, though it may foster such a rise; (2) that a supply of houses at less than the market value will not only have the same results as a supply of allotments, but also will attract workmen from other districts, and even other countries, who will increase the pressure upon accommodation; (3) that it is very difficult to confine the benefits of such a system to the class for whom it is intended, with the result, if a different class enjoy them, of increased pressure in other quarters. All these considerations, coupled with the actual experience of success on the part of various joint-stock enterprises, point to the provision of dwellings as a matter which may well be left outside the sphere of state-action. III. Three forms of state charity are so closely connected that they may be considered together. (*a*) *Free Schools*.—Comparatively few writers have maintained that elementary education should be left to private enterprise, and it is probably undertaken or organised by the state in every civilised country. But much controversy has arisen on the point whether it should be given free of charge. On the one hand it is said that if the poor are deprived of their children's earnings by the compulsory system, it is right that at least they should have them taught for nothing; and again that educational endowments have been in very many cases monopolised by the rich, who may fairly make compensation by paying for the education of the poor. With these arguments the economist is not concerned. It is also said to be well worth while, inasmuch as education diminishes crime and pauperism—a statement vigorously denied by some writers, as by Mr. Herbert Spencer: or again, because it increases the efficiency of a nation's labour, by assuring the general education which is a necessary preliminary to a technical one, and, lastly, because it raises a nation's moral tone indirectly if not directly: in short that education is so necessary a condition of civic life, in any real sense, that it cannot be left to the option or power of a parent to provide it. All these arguments, it will be noted, presuppose that education cannot be general or compulsory unless it is free. (*b*) *Free Libraries*.

—Free schools carry with them free libraries, that is to say, if it be worth while to give elementary education, it is also worth while to give the necessary complement, without which the educated youth is turned loose with his mental appetite sharpened and nowhere to graze. No complaint is more common in the country districts than that the effects of elementary education disappear in a few years. It is also argued that the amount of good done is out of all proportion to the cost. It is a striking case, says Prof. Jevons, "of the principle of multiplication of utility." Thus the cost of each issue from the Birmingham Free Library is under twopence. Economically, too, there is a direct advantage. The supply of wholesome literature not only cheers and brightens a workman's life, making him a better producer, but it also helps him to special knowledge. At a free library he learns where his labour is in demand, and so the mobility of labour is increased. He learns also the lessons of history, gets a wider horizon of knowledge, and greater familiarity with the points at issue in trade disputes, etc. (c) *Free Dinners*.—Free schools are said also by some to carry free dinners with them. It is useless, and even cruel, it is urged, to force children into school who cannot profit by instruction for want of nourishment, and it is beyond question that in large towns numbers of children come in that condition every day. Now it is the duty of the state to provide the conditions of mental development, of which teaching is only one, and therefore in such cases as the above it is argued that it should provide dinners as in other cases it provides desks. The objections to the provision of education, libraries, and dinners by the state are up to a certain point common to all three. Thus we may say that so far as experience and history are any guide, the only motive which can be trusted to work generally and constantly in making men industrious is self-interest, *i.e.* the desire for necessities and luxuries. Anything which weakens this motive by supplying the results of industry without its exercise helps to increase the idle class in the community—the least profitable and probably the least happy of all—and so to decrease the amount of production. Again, any measures which guarantee the means of supporting children will, in the long run, diminish providence in the matter of marriage and increase population; in other words, the evils it is sought to cure will grow greater and not less. Now both the training and feeding of children, it is argued, are matters for which persons should make provision, or should see their way to supplying before they marry; and it is unwise to enable them to dispense with such provision. The general contention that free schools weaken or diminish the sense of parental responsibility is met by two special arguments. First, by pointing out that the bulk

of the expense of a child's schooling is already borne by other than its parents, and always must be. Subscribers, endowments, voluntary or compulsory rates contribute by far the larger part of the cost of carrying on a school. Consequently free schools present a question of degree rather than of kind. This argument applies only to the special circumstances of England. Secondly, by denying the truth of the statement. In such matters disproof is not easy. We may trace a connection between a motive and a fact, or *vice versâ*, as between the absence of outdoor relief and the strength of family affection in Ireland, but it is hardly possible to demonstrate more than this. It is said, however, that in the United States the strongest sense of responsibility goes hand in hand with free schools, the parents straining every nerve to provide for their children a secondary education, the primary being found for them by the state. Again it may be questioned whether educational endowments have had any such result as the weakening of responsibility on the part of middle-class parents, who, in the main, enjoy them. So again with regard to free libraries. The existence of these is not found to diminish men's zeal for the possession of books; on the contrary, the business of booksellers increases in towns where they are opened. The existence of a state-supported library in the British Museum, or endowed libraries as those of Oxford and Cambridge, is not found to have any bad effect on those who use them. There is no difference in principle between supplying at the public cost rare books and any other—rarity is wholly relative. Libraries stand on the same footing as picture galleries, the provision of which is a recognised function of the state. As to free dinners it may be said, whilst in all countries the provision of education is a state matter, and is never kept wholly to individual effort, etc., the provision of meals is a family or domestic matter. The difference between the two is one of principle, and the supply of food should never be undertaken by the state, except in cases of destitution, when it falls within the province of the poor law. Further, an inquiry conducted in 1889 by the Charity Organisation Society showed that the evil to be met by free dinners was of such small dimensions as to call for no exceptional measures, and that where exceptional measures had been adopted the evil had greatly increased.

The sphere of state action, including state charity, is rarely if ever determined by logical considerations: it is more often the result of historical events. When we ask ourselves the abstract question, how far will the state do more good than harm, or *vice versâ*, by the provision of necessities or comforts, experience gives no certain answer. The conditions of the problem vary with each succeeding generation and in each country. The answer will depend largely

on a balance of probabilities. How far will industry and thrift be weakened, family life threatened, and human feeling deadened, by state charity? How far, again, is improvement made possible, a higher standard conceived, a progressive desire fostered, by the provision of certain conditions of realising an end in life? L. R. F.

CHARTER. A written document by which the crown, in virtue of its prerogative, confers special privileges on an individual, or group of individuals. The term was at one time applied to conveyances of land, and to measures adopted by the crown by way of legislation. In modern times, the crown's assent to the formation of a corporation, such as a university, a city, a bank, or a trading company, is frequently given by charter. Trading corporations are usually formed under the companies acts, but where these are not applicable, a charter of the crown has sometimes been obtained. The North British Company was incorporated in this way in 1881 (see charter in *London Gazette*, 8th Nov. 1881, pp. 5448-5453). In the charter of this company, it is expressly declared that the grant is not to authorise the setting up of any monopoly of trade, and is to be subject only to customs duties imposed for revenue purposes, and to restrictions on importation similar to those existing in the United Kingdom. Formerly, it was thought that foreign trade could be best promoted by conferring a monopoly of trading with certain countries, and various companies were incorporated by charter with this object. The chief companies so formed were the East India Company, 1600; the South Sea Company, 1711; the African Company, 1618; the Russia Company, 1553; the Eastland Company, 1579, and the Turkey Company, 1593. (See *AFRICAN COMPANIES*, *EARLY*.)

[Chitty, in his *Commercial Law*, vol. i. p. 661, gives a concise account of these companies. Adam Smith in *Wealth of Nations*, bk. v. ch. i. discusses the economic effects of such monopolies. The right of the crown to grant a trading monopoly depends on the 21 Jac. I. c. 3, and is discussed in Broom's *Constitutional Law*, 1886, p. 239.] J. E. C. M.

CHARTER PARTY. A document embodying a contract by which a ship or part of a ship is let to a merchant for the conveyance of goods on a determined voyage to one or more places. The instrument expresses the freight to be paid, the tonnage, the nature of the cargo, and other particulars. The merchant usually covenants to load and unload within a specified time, or if he delay the ship for a longer time, to pay a fixed daily sum, which is called demurrage. It frequently happens that the option of a number of ports is given to the consignee (the person to whom the ship is addressed), a certain port or several ports being named in which the master of the ship is to call for orders. E. S.

CHARTISM. The chartist movement was in its origin and its aim economic. It arose out of the economic necessities of the time, and its leaders had before them, as their ultimate object, social and industrial amelioration. To understand fully this aspect of chartism we must study the movement in its two phases: (1) from 1836 to 1839; (2) from 1840 to 1848.

(1) 1836 to 1839. Three circumstances may be regarded as bringing about the chartist movement: the commercial and industrial distress immediately preceding it in time; the introduction of machinery with its effects; and the new poor law of 1834. Various men were of course variously affected by these causes; but their common action was secured by the predominant influence of one man, and the action of another, supported as he was by his colleagues. The influence referred to was that of Robert Owen, who had preached the gospel of optimism and social regeneration when all around seemed overshadowed with a gloomy present and a threatening future, and, further, urged on his followers and all with whom he came in contact, the need of education and moral elevation. It was, however, the action of Lord John Russell that brought into united action bodies so diverse in aim and constitution as the working men's association of London, the Birmingham political union, and the unions of the north, these latter being under the guidance of Feargus O'Connor. Briefly described, the first was educational and moderate, the second unstable, partly desirous of bringing about the adoption of Mr. Attwood's currency scheme, and partly anxious for general industrial amelioration, while the latter formed centres for violent denunciation of the rise of machinery, and of the application of the new poor laws. All, however, hoped to attain their ends by bringing pressure to bear on parliament, itself to be rendered more amenable by a further extension of the franchise; and hence Lord John Russell's declaration against all further reform united them together and led to the formation of the national convention. The task to which this body devoted itself was mainly political, and to attain its object recourse was had first to menaces and then to open revolt. The former were disregarded and the latter was suppressed. Meantime, however, in the northern unions an almost socialistic attitude had been taken by some of the leaders. Throughout the entire movement, indeed, there had been symptoms that many were thinking of and aiming at an entire social reconstruction.

(2) 1840 to 1848. The second phase of chartism differed essentially from the first. It was of smaller account in every way but one. Its strength was less, its adherents fewer, its organisation less stable; but the views of its leaders were much more advanced. In theory, Bronterre O'Brien stood far ahead of any other. He was

socialistic in his aims, but, unlike some of his associates, he did not confuse socialism and industrial retrogression. His schemes were, it is true, somewhat immature, but he may be described as feeling about for a new social organisation. Feargus O'Connor, on the other hand, was neither so consistent nor so advanced in his aims. Thus at one time he was advocating the claims of the "National Charter Association," for so the organisation of the chartists was called, while at another, in defiance of the advice of his associates, he advocated a new scheme for bringing the people into connection with the land. In opposing the Anti-Corn Law League, it should be noticed, however, that he based his antagonism on the need which he alleged to exist of general social reconstruction (see especially speech, 5th August 1844). But the direct effect of the agitation at this period was small. Discussions among the leaders and mutual accusations "of interested motives" diminished their following, and it was to little or no purpose that O'Connor sought to win them back by his apparent advocacy of their interests in a periodical called *Labour*, or by his national land scheme. The latter, as a matter of fact, was financially unsound. The movement failed. That the leaders were really in earnest in their agitation is probable from the circumstances which have been alluded to, as also from their decided refusal to form any alliance with the middle class, or capitalist, reformers of Birmingham.

In its two phases, then, chartism was of economic importance. During the earlier period it aimed at economic regeneration; during the second, it not only aimed at this, but assumed a socialistic character.

[*Historical Review*, October 1889.—Gammage, *History of the Chartist Movement*.—Place, *MSS.*—*Northern Star* and other papers.] E. C. K. G.

CHARTISM. THE POINTS OF THE CHARTER. The Charter itself was a document in the form of an act of parliament, drafted by Francis Place from materials supplied by William Lovett. Its proposals were always summed up under six heads or "points," viz. Universal, *i.e.* adult male, Suffrage, the Ballot, Annual Parliaments, Payment of Members, Equal Electoral Districts, and Abolition of Property Qualification. No one of these proposals was in any sense new, and the great majority of them had been continuously agitated for more than fifty years. The Duke of Richmond introduced a proposal for adult suffrage and equal electoral districts into the House of Lords in 1780. All or nearly all the charter "points" were adopted by the Society of the Friends of the People, and the Corresponding Society in the earlier years of the French Revolution, and by that Edinburgh Convention for taking part in which Muir and Palmer were sentenced in 1793. The "points" were generally spoken of as the Duke of Richmond's, or Sir Francis Burdett's, or Major

Cartwright's "plan of radical reform," and were undisputedly intended by all their working class supporters to be used for bringing about economic as well as political equality. During the ten years following the French war every period of high prices and low wages produced a fierce agitation for "radical reform" in the manufacturing districts and sometimes also in London. In 1830-32 the "plan" was for a time given up in favour of the Reform Bill, but in London amendments in favour of universal suffrage were carried at the public meetings held in support of Lord Grey's bill. These were generally moved by members of the "Rotunda Gang," or National Union of the Working Classes, many of whom had been personal disciples of Robert Owen. The reformers of 1790-1820 had advocated Tom Paine's proposal of a graduated income tax, or had been followers of "Spence's plan" of land municipalisation. These men went further, and were strongly though vaguely socialistic in tone. Place describes them as "filled with bitter notions of animosity against everybody who did not concur in the absurd notions they entertained, that everything which was produced belonged to those who by their labour produced it, and ought to be shared among them; that there ought to be no accumulation of capital in the hands of any one to enable him to employ others as labourers, and thus by becoming a *master* make slaves of others under the name of workmen, to take from them the produce of their labour, to maintain themselves in idleness and luxury while their slaves were ground down to the earth or left to starve. They denounced every one who dissented from these notions as a *political economist* under which appellation was included the notion of a bitter foe to the working classes—enemies who deserved no mercy at their hands."

Place also gives a good specimen of their teaching in a song published about this time—

"Wages should form the price of goods,
Yes, wages should be all;
Then we who work to make the goods
Should justly have them all.
But, if the price be made of rent,
Tithes, taxes, profits all,
Then we who work to make the goods
Shall have—just none at all."

From among these men came Lovett, Cleave, Hetherington, and others who were afterwards leaders of the Chartist movement. It is significant that their organisation was called successively the "British Association for Co-operative Knowledge" (*i.e.* of Robert Owen's principles) in 1829; "The Metropolitan Trades Union" in 1830, when one of their declared objects was to "enhance the value of labour by diminishing the hours of employment," and "The National Union of the Working Classes," for nominally political purposes, in 1831.

After the complete failure of the chartist movement in 1848, working-class reformers generally returned to the work of co-operation and trades-unionism, so that the economic side of the agitation which carried the Reform Bills of 1867 and 1884 was not so apparent as the political side. But the bill of 1867 was opposed on economic grounds by Robert Lowe (afterwards Lord Sherbrooke), Lord Shaftesbury, and others. Lord Shaftesbury on that occasion said:—"I am sure that a large proportion of the working classes have a deep and solemn conviction—and I have found it among working people of religious views—that property is not distributed as property ought to be; that some checks ought to be kept on the accumulation of property in single hands; that to take away, by a legislative enactment, that which is in excess, with a view to bestow it on those who have insufficient means, is not a breach of any law, human or divine."

[Authorities as above, and William Lovett's *Autobiography*.—Bamford's *Life of a Radical*.—*The Annual Register*, and Hansard's *Parliamentary Debates*.—Scribner's *Century Magazine*, January 1882.] G. W.

CHASTELLUX, FRANÇOIS JEAN, Marquis de, born at Paris 1734, died 1788. By profession a soldier, he was received, 1755, into the *Académie française*, a distinction which he owed to the success of his principal work, *De la félicité publique ou considérations sur le sort des hommes dans les différentes époques de l'histoire* (1st ed. 1772, 2 vols. in 8vo; 2d ed. 1776, 2 vols. in 8vo; 3d ed. 1822, 2 vols. in 8vo, with notes by Voltaire). This work, if out of date in form, is yet full of ideas which would do no discredit to a book of our own times. In particular he discussed the question of the population a quarter of a century earlier than Malthus, and from the same point of view as that distinguished economist. A. C. F.

CHATTEL or CHATTEL PERSONAL. Any movable thing which can be part of a person's property. The expression "chattels real" is applied to interests in land granted for a fixed number of years, as, for instance, leasehold interests. Chattels real are thus classed with ordinary chattels (with which they have otherwise nothing in common), because after the death of an intestate owner the devolution is in both cases the same, while the descent of immovable freehold property is regulated in a different manner. This somewhat anomalous and artificial distinction may soon disappear and the expression "chattels real" will then, no doubt, become obsolete. E. S.

CHECKS ON POPULATION. According to the theory of MALTHUS (*q.v.*), population invariably increases when the means of subsistence increase unless prevented by some powerful and obvious checks. These checks, and the checks which repress the superior power

of population and keep its effects on a level with the means of subsistence, are all resolvable into moral restraint, vice, and misery. These checks are classified as preventive and positive; by the former the birth-rate is diminished, by the latter the death-rate is increased. Personally Malthus was the strongest supporter of moral restraint as exemplified in late and provident marriages, and he makes no mention even of those physical checks with which, in the present day, his name is often associated (*e.g.* by the late Mr. Bradlaugh).

[Malthus, *Essay on Population*.—Doubleday's *True Theory of Population*, London, 1846.—Bonar, *Malthus and his Work*.] J. S. N.

CHEQUES, LAW OF. The law relating to cheques is now mainly contained in §§ 73 to 82 of the Bills of Exchange Act 1882 (45 & 46 Vict. c. 61), which codifies the law relating to bills, notes, and cheques. A cheque may be described as an order by a customer to his banker to pay on demand a given sum of money to, or to the order of, a specified person, or to bearer. Its strict legal definition is contained in § 73 of the act, and is as follows: "A cheque is a bill of exchange drawn on a banker payable on demand." The section then goes on to enact that, subject to the special rules contained in §§ 74 to 82, the provisions of the act applicable to bills payable on demand shall apply to cheques. It follows from this enactment that the paying banker is not bound to verify the indorsements on a cheque (§ 60), though he pays at his own risk if the drawer's signature be forged; that a cheque is not entitled to days of grace (§ 14); that the expenses of noting a dishonoured cheque are recoverable (§ 57); and that notice of dishonour must be given to the drawer and indorsers unless excused under § 50 of the Act. A cheque should be stamped with a penny stamp in the same manner as any other bill payable on demand.

When a banker opens an account with a customer the relationship between them is that of debtor and creditor, with a superadded obligation on the part of the banker to honour his customer's cheques as long as there is sufficient money to his credit to meet them. The right to overdraw only arises from special agreement. A banker's authority to pay his customer's cheques may be determined by countermand of payment, by notice of the customer's death, or that he has committed an actual act of bankruptcy, or by the fact that a receiving order has been made against him. If a banker wrongfully dishonours his customer's cheque, he is liable to the customer in an action for damages, and it has been said that the smaller the cheque the greater the wrong, inasmuch as it implies a greater reflection on the customer's credit. The holder of a cheque which is wrongfully dishonoured has no remedy against the banker, for there is no privity of contract

between them, and a cheque, being a bill of exchange, does not, according to English law, operate as an assignment of the funds in the banker's hands, even though it be drawn for the exact amount of the customer's balance (see, however, § 53 as to Scotland).

Though a cheque is an instrument intended for prompt presentment, the drawer, in case of delay, is not relieved from his obligation to the holder unless he suffers actual damage through the delay, as, for instance, through the failure of the bank on which the cheque was drawn. In such case the drawer is discharged to the extent that he has been damnified, but the holder is allowed to take the drawer's place in proving against the bank (§ 74).

Crossed Cheques. The practice of crossing cheques first received legislative recognition by the statute 19 & 20 Vict. c. 25. This act was amended by the 21 & 22 Vict. c. 79, in consequence of a decision to the effect that the crossing was not an integral part of the cheque. In a case decided in 1875 it was held that if a crossed cheque was stolen and got into the hands of a *bona fide* holder, the true owner had no remedy, even though the cheque was paid in contravention of the crossing directions. To meet this defect the Crossed Cheques Act 1876 was passed, which introduced the "not negotiable" crossing. These enactments are now repealed, and §§ 75 to 82 of the Bills of Exchange Act take their place.

A cheque may be crossed either generally or specially. A general crossing makes it payable only when presented through a bank, but any bank will do. A special crossing names the bank by which the cheque must be presented. A cheque may be crossed either by the drawer or by the holder, and the holder may convert a general crossing into a special crossing. When a cheque is crossed specially the banker to whom it is crossed may again cross it specially to another banker for collection, but a cheque must not otherwise bear two crossings. A collecting banker is also allowed to cross to himself an uncrossed or generally crossed cheque. If a crossed cheque be paid contrary to the directions of the crossing, the paying banker is liable to the true owner for any loss he may sustain thereby. A cheque which is crossed either generally or specially may further be crossed with the words "not negotiable." These words are a little misleading. They do not mean that the cheque is no longer transferable. The cheque may be transferred as before, but the person who takes it with these words on it does not obtain, and is not capable of giving, any better title to the cheque than that which the person from whom he took it had. A cheque so crossed is very much on the same footing as an overdue bill of exchange. Suppose a cheque payable to bearer and crossed "not negotiable" is stolen. The thief gets a

tradesman to cash it for him, and the tradesman passes the cheque through his bank and gets it paid. The paying and collecting banks would incur no liability if they obeyed the directions of the crossing, but the tradesman would be liable to refund the money to the true owner; or again, assuming payment of the cheque to have been stopped, he could not sue the drawer. For further information as to cheques, see the headings BILL OF EXCHANGE; CLEARING SYSTEM; DIVIDEND WARRANT.

M. D. C.

CHERBULIEZ, ANTOINE ÉLYSÉE, born at Geneva 1797, died at Zurich 1869. Originally a barrister, then a magistrate, he replaced Rossi, 1833, at the academy of Geneva as professor of law (*droit*), and, 1835, as professor of political economy. His first works were political, as he was a member of the legislature of the canton from 1831 to 1846, then of the representative council, and finally of the general assembly and great council up to 1848. His political works are *Théorie des garanties constitutionnelles* (2 vols. in 8vo, 1839); *Études sur la loi électorale de 1831* (in 8vo, 1840); finally, *De la Démocratie en Suisse* (2 vols. in 8vo, 1845). But it was especially as an economist that he made his mark, and his works on this branch of study are much valued. By 1840 he published *Riche ou Pauvre, exposition succincte des causes et des effets de la distribution actuelle des richesses sociales* (in 8vo). Then after 1848, the date when he fixed himself in France, *Le socialisme c'est la barbarie*, an examination of the social questions raised by the revolution of 24th February 1848 (in 8vo, 1848). *Simple notions de l'ordre social*, for the use of every one (in 18mo, 1848). *Le potage à la tortue*, popular conversations on social questions (in 18mo, 1849). Finally *Étude sur les causes de la misère tant morale que physique*, and on the means of remedying them (1 vol. in 8vo, 1853). He was a very active member of the Political Economy Society. He returned to Switzerland at the time of the *coup d'état* of 1851, and was immediately appointed to the chair of political economy at Zurich at the polytechnic federal school of Switzerland. It was while thus engaged (in 1862) that Cherbuliez wrote his most important work—*Précis de la science économique et de ses principales applications* (2 vols. in 8vo); the value of which was recognised by the institute of France, and led to his election as a corresponding member. Cherbuliez also assisted in the preparation of the *Bibliothèque universelle de Genève* in which, and in the *Journal des Économistes*, he wrote numerous articles. A. C. F.

CHEVAGE. The use of this word in mediæval documents is a little vague, and in consequence the exact sense in which it is employed is not always clear. Bracton, at page 48 of vol. i., describes chevage as a fixed payment to the lord made at fixed times by "nativi" or

bondmen who are engaged in trade, or as soldiers, or who, from any other reason, have ceased to reside on the lord's manor; this payment is "made as a sign of subjection," and "so long as the bondmen pay chevage they are said to be in the power of the lord, nor is his power destroyed," even though they cease to reside on the manor. Britton, bk. i. c. 32, gives a slightly different account but does not define chevage. He says "that in order that the lord may retain his power over his bondmen, it is only necessary that he be in possession of their services, so that he may take services from their holdings, and from those who hold no land in villenage may take a penny a year of 'chevage' and a day's work in harvest time, or other little or great service according to their ability." It is clear from this passage that chevage was a payment made by a man of villein status, who was for some reason not in the ordinary position of a villein, and that it was made either in return for the privilege of being allowed to reside off the manor, or merely as a recognition of the fact that, although he had no holding in the manor like other villeins, he was nevertheless one of the lord's bondmen. An instance of the first kind of chevage can be found in the account of the manor of Ansty for the year 2 & 3 Henry IV., which is printed at page 521 of Cunningham's *Growth of English History and Commerce*, ed. 1890. The amount paid for licence to leave the manor for a time is one shilling in one case, and sixpence in another. But in many manorial accounts an entry can be found of the chevage of a whole manor, and it is probable that if this meant a payment for leave to remain off the manor, the name of the person making the payment would have been given. It is not possible to speak definitely on the point. Britton clearly suggests the existence of a class of villeins outside the land organisation of the manor, and, from a comparison of his account with Bracton's, it would appear that the class of villeins not included in the manor as landholders grew up in the time which elapsed between the two writers.

In the court rolls of some manors the word occurs in yet another sense. Strictly speaking all the villein tenants of a manor were bound to appear at the manorial court to assist in the decision of the matters discussed there. But in some manors a kind of representative system was in use, under which each tithing or group of tenants was represented at the court by its chief man; and for this privilege of attending the manor court by deputy a payment at the opening of each court was made to the lord; to which the name of chevage is sometimes given.

For instance in the court roll of the manor of Hemmingford printed at page 88 of Prof. Maitland's *Select Pleas of Manorial Courts*, the persons

who attend the court give as chevage 13s. 4d. Other instances of this payment are given in the same book. The poll-tax paid by the Jews before their expulsion from England was sometimes also called chevage.

[Bracton, *De Legibus Angliæ* (Rolls Series, 1878).—Britton, edited by F. M. Nicholls, 1865.—*Select Pleas in Manorial Courts*, vol. i. edited by F. M. Maitland (Selden Society), 1888.—*Growth of English Industry and Commerce*, Cunningham, 1890.]

C. G. C.

CHEVALIER, MICHEL, born at Limoges 1806, died at the Château de Montplaisir near Lodève (Hérault) 1879. Having distinguished himself at the polytechnic school, he commenced life in the *département du nord* as a mining engineer, a post which he gave up in 1829 to join SAINT-SIMONISM (*q.v.*) His style, the brilliancy of which was early recognised, won for him the position of editor-in-chief of the *Globe*, the organ of that school of socialism of which he rapidly became one of the most active and influential members. Faithful, through the troubles which ensued, to the Saint-Simonian faith, he was condemned, 28th August 1832, to a year's imprisonment and one hundred francs (£4) fine, as the responsible agent of the *Globe*, in which articles appeared which were accused of being outrages on public morality. His intentions were worthy, and his habits of life more strict than appearances would have led the world to suppose; hence the government itself, which discovered at this time M. Chevalier's abilities, remitted half the penalty, and also entrusted to him the mission of studying the railways of the United States. It is enough to say of the labours of our economist in this direction that in a memoir entitled the *Système de la Méditerranée* (1832, in 8vo), he foresaw with rare intelligence the future of these new methods of communication. He sent from America to the *Journal des Débats*, which had taken him on its staff even while he was in prison, articles which, published in two volumes, furnish a collection of the highest value, even after the lapse of fifty years—the *Lettres sur l'Amérique du nord* (2 vols. in 8vo, 1836). He commenced also at this date to write in the *Revue des Deux Mondes*. Soon after his return from America he published, as the result of his mission, the *Histoire et Description des voies de communication aux Etats-Unis et des Travaux qui en dépendent* (1840, 2 vols. in 4to), with an atlas in folio.

His pen, from this date, was able to render all the subjects which it treated interesting; but his judgment, especially on its economic side, only formed itself into shape gradually. The successive stages through which he passed are all the more obvious in his writings, as with a rare sincerity, he never sought to cloak them from view. A volume in 18mo, *Des Intérêts matériels en France*,—on public works, roads, canals, railways,—appeared in 1838, bringing

into one series those articles of his which had appeared before on these different subjects. M. Chevalier intended to have completed this volume, which put forward a kind of economic programme, by adding to it two other parts; credit institutions and those which supply professional education. This idea, unfortunately, was never realised. Devoted to peace, he opposed, in a pamphlet addressed to M. Molé, the fortifications of Paris. He replaced, 1841, Rossi at the Collège de France in the chair of political economy. The lectures of the two first years, taken down in shorthand by one of his pupils, Michel Broët, form the material of two volumes in 8vo, which appeared in 1842 and 1844 (1st ed.), and in 1855 and 1856 (2d ed.). One can see, by reading each volume alternatively in the first and the second editions, what the modifications were which the judgment of the author passed through, gradually and almost unconsciously, as the years of his professional work went by.

Thus, to quote only one example, freedom of competition at first inspired him with alarm, and caused him to advocate reservations, the necessity of which he no longer felt in 1855 and 1856. We may add that in 1850 a third volume of his lectures appeared, of which a second edition was published in 1866. The subject was *La Monnaie*; the work is full of technical details of the highest interest, and written with a masterly hand. In 1845 he was elected a deputy by the department of l'Aveyron; but his resolute acceptance of the principle of free trade hindered him from being re-elected the next year.

The Revolution of 1848, which Chevalier submitted to rather than joined, found him none the less disposed to combat courageously, step by step, the socialistic errors which triumphed at the Luxembourg in the *Commission du gouvernement pour les travailleurs*, presided over by Louis Blanc. He wrote at that time in the *Journal des Débats* a series of letters called *Lettres sur l'organisation du travail*, which, collected under this title, form a stout volume in 18mo. This and the *Lettres sur l'Amérique du nord*, may be considered as the most characteristic and remarkable works of this author. The result of the appearance of these letters, written off-hand, and under the pressure of the events which were happening around him, was a decree from the government suspending him from lecturing at the Collège de France. The *Assemblée constituante* annulled this decree the December following, and Michel Chevalier was able to return to his chair.

The Institut (*Académie des Sciences morales et politiques*) opened its doors to him February 1851. At the end of that year he gave in his adhesion to the government of the *Coup d'état*, following in this rather his judgment than his

inclination. He believed liberty to be more in peril under the class of parliamentary government of which he had seen the working, than under a personal government. Called to the council of state February 1852, he had to ask for a substitute to give in his stead his course of lectures at the Collège de France. It was M. Henri Baudrillart who undertook this duty for him. At the same date M. Chevalier published the *Examen du système commercial connu sous le nom de système protecteur* (in 8vo.), a work in which protectionism was demolished completely, and the advantage of commercial liberty shown.

Immediately after this he rendered the last-named cause a service of a very different character. Holding as he did the same opinions as Richard Cobden, whom he presented in 1859 to the emperor, he induced Napoleon III. to sign the famous commercial treaty with England of 23d January 1860, which was the precursor of the French treaty of 1861 with Belgium, of 1862 with the Zollverein, of 1863 with Italy, of 1864 with Switzerland, of 1865 with Sweden and Norway, the free cities of Bremen, Lubeck, and Hamburg, and the grand-duchies of Mecklenburg-Schwerin, Sirelitz, and Holland, of 1866 with Portugal, then with Austria, and finally of 1866 with the pontifical states. These treaties introduced, so to say, free trade into the public international law of Europe. But this system is at the present time destroyed in France, where protectionism has struck its roots afresh, and causes all consumers to pay toll for the advantage of the privileged producers.

In 1859 Michel Chevalier published a new volume with the significant title, *De la baisse probable de l'or* (in 8vo). It was translated into English by Cobden in the same year. Facts, as is well known, have shown he was wrong in his opinion on this point.

He strove later against Louis Wolowski in favour of the single standard (gold, this time) against the system of a double standard combined with a fixed ratio. The question of the banks became also in his hands the occasion for a vigorous contest. Wolowski strove for the unity of banks, Michel Chevalier for their duality (1864). He resumed his duties as professor in 1866, and carried them on till 1878, when he took afresh a coadjutor, this time one of his sons-in-law, M. Paul Leroy-Beaulieu, who was destined, after his death, to become his successor.

A strong supporter of exhibitions, especially of universal exhibitions, he wrote a brilliant introduction, in 8vo, to the reports of several juries of the magnificent industrial and international *fête* which took place at Paris in 1867.

This economist, though his natural predilections for the less rigid side of economic science were too strongly marked, is justly reckoned,

on account of his strictly scientific exactness, his brilliant style, and the depth of his views, among the highest of his class in France. His pen was most fertile, but we have only thought it needful to enumerate above his chief works.

CHICKERING, JESSE, M.D., born in New Hampshire 1797; entered the Unitarian ministry, then practised medicine, and died in West Roxbury, Massachusetts, 1855. He was interested in statistical inquiries and published *A Statistical View of the Population of Massachusetts, from 1765 to 1840*, Boston, 1846, pp. 160;—*Immigration into the United States*, Boston, 1848, pp. 94, in which he questions whether too much encouragement has not been given to immigration to the United States; and also *Comparative View of the Population of Boston in 1850, with the Births, Marriages, and Deaths, in 1849 and 1850*, Boston, 1851, pp. 7-58.

D. R. D.

CHIEF RENT. See RENT CHARGE.

CHILD, SIR JOSIAH (born 1630, died 1699), the chairman, and virtually the ruler, of the East India Company for some years. He aimed at aggrandising the Company by extending its political power, and restraining competition with its trade. Several anonymous writings in defence of the Company are attributed to Child. Under the sobriquet *φιλοπάτρις* (*sic*) (1681) he maintains that "the clamours, aspersions, and objections made against the present East India Company are sinister, selfish, or groundless." While contending that "the trade of the East Indies cannot be carried on to a national advantage in any other way than by a joint stock," he enumerates many enlightened principles, as that "silver and gold, coined or uncoined, though they are used as a measure of all other things, are no less a commodity than wine, oil, tobacco, cloth, or stuff, and may in many cases be exported as much to national advantage as any other commodity. That no nation ever was or will be considerable in trade that prohibits the export of bullion." In the *Humble Address of the Governor . . . to a Paper of Propositions for Regulation of the East India Company . . .* (Somers's *Collection of Tracts*, vol. iii.), "the great monopolist," as Macaulay says, "took his stand on the principle of free trade."

Similar antinomies, as they appear to our age, are noticeable in Child's principal work, the *Discourse upon Trade*. He asserts the principle of competition, the law of market, thus unequivocally: "They that can give the best price for a commodity shall never fail to have it, by one means or another, notwithstanding the opposition of any laws, or interposition of any power by sea or land; of such force, subtlety, and violence is the general course of trade" (chap. viii.). Yet the paradox, the "unum quædam," which is recommended is a legalised rate of interest. Child admits, with regard to

the navigation laws, that unrestricted commerce might be best "if the present profit of the generality be barely and singly considered"; but holds that "profit and power ought jointly to be considered" (chap. iv.) (This was also his contention.) He considers that the doctrine of the balance of trade does not apply to the trade with East India, "both in point of strength and warlike provisions, in regard of shipping and saltpetre, but [and] also in respect of the furtherance it gives to many other trades," by means of which England regains more specie than the company exports (chap. ix.) But the trade with Venice in "currance purchased with our ready money" is to be discouraged. "Concerning plantations" (chap. x.), Child argues, in a manner worthy of Malthus, that the colonies have not caused the depopulation of the kingdom. It is a more disputable proposition that "most nations in the civilised parts of the world are more or less rich or poor proportionable to the paucity or plenty of their people." Equally instructive is Child's scheme for the relief and employment of the poor (chap. ii.) There is a spirited criticism of this scheme in Eden's *State of the Poor*.

The first draft of this work was published in 1668. The original title appears to have been *Brief Observations Concerning Trade and Interest of Money* (British Museum Library ^{1029.b.1}/₂). This tract was reissued in a later edition, together with a preface and ten additional chapters; the whole work being designated by the title *The New Discourse of Trade*.

CHILDREN'S LABOUR (FACTORY ACTS).

Few records exist anterior to the rise of the factory system which throw light upon the conditions attending the labour of children. Lord Macaulay (*History of England*, ch. iii.), states that in the 17th century, the practice of setting children to work prematurely existed "to an extent which, when compared with the extent of the manufacturing system, seems almost incredible. At Norwich, the chief seat of the clothing trade, a little creature of six years old was thought fit to labour." In 1677, a Worcestershire ironmaster, Andrew Yarranton, published a pamphlet entitled "England's Improvement by Land and Sea," in which the schools then existing "in all the towns of Germany," for the purpose of training girls in the art of spinning linen, are described. Children of six years old and upwards were, sometimes to the number of two hundred in a single room, systematically employed in this industry, producing large quantities of excellent yarn. The writer urged that efforts should be made to follow the German plan in England, especially in the counties of Warwick, Leicester,

Northampton and Oxford. His advice was, however, not adopted. About the beginning of the 17th century the manufacture of lace by machinery was introduced into this country by refugees from the Continent. In Bedfordshire and Buckinghamshire, schools were established for teaching the art to young children (Felkin's *History of Machine-Wrought Hosiery and Lace Manufactures*, 1867). But throughout the greater part of that century the manufacture of textile fabrics was mainly a domestic industry, and the children of the household were compelled to labour long and hard. Dr. Cooke Taylor (*Silk, Cotton, and Woollen Manufacture*) holds that the system of overworking children "was at its worst and greatest height long before anybody thought of a factory." Probably the most comprehensive account of the employment of juvenile labour in productive industry before the rise of the factory system is to be found in Mr. R. Whateley Cooke Taylor's *Introduction to a History of the Factory System*.

The latter half of the 18th century witnessed a number of remarkable inventions, each of which aided in the establishment and spread of that highly organised method of industry known as the factory system. The discovery of the spinning machine, of the mechanical loom, of the steam engine, of the cotton gin, of the calico-printing machine, and of coal gas for illuminating purposes, successively tended to the aggregation of workpeople in textile manufactures. They aided too in that separation of processes, known as the "division of labour," which opened the way for an extensive employment of children in the lighter and simpler processes calling rather for dexterity than strength. But it was not alone in the textile manufactures that this conversion of domestic into factory industry was going on. It gradually spread into other productive departments. Unquestionably, however, it was in the textile occupations that the growing employment of infantile labour, and the abuses accompanying it, first drew public attention to the necessity of factory legislation. In Lancashire and Derbyshire the rapid increase of the cotton manufacture created a great demand for labour, and the population grew faster than the means of decent habitation. There was consequently much overcrowding, and the mills themselves were unhealthy, whilst the labour was long and exhausting. Large numbers of pauper children were brought from southern parishes, where the local authorities were glad to get rid of them, and the accommodation provided for these young and overworked immigrants was very defective. The result was a serious epidemic disease, which at the close of last century wrought great havoc amongst the factory population, and especially amongst the children. In 1802, therefore, the first factory act (the Health and Morals Act) was passed. However, beyond ordaining some

sanitary regulations of a general kind, the act did not apply to others besides the apprenticed children, drawn chiefly, as already stated, from distant portions of the country. Children of families living near the factories were still subject to oppressive treatment, their parents being as a rule regardless of their health. The need of further interference being demonstrated by an inquiry conducted by parliament in 1815-1816, a second act was passed in 1819, but its operation was confined to cotton mills. No child might begin to work under nine years old, and between that limit and sixteen years the hours of labour were not to exceed twelve per day, and night work was prohibited. The next act, that of 1825, restricted the labour of children to nine hours per day, and these were not to extend beyond five o'clock in the morning and half-past four in the afternoon. Still further, meal hours were carefully defined, and employers were, for the first time, compelled to keep a register of the children working for them. Then came the early days of the trade unions, which were marked by much violence, the issue of which was the Act of 1st and 2d William IV. c. 39, consolidating and improving previous factory acts, but without affecting very seriously the status of children. Later on, however, Lord Althorp's Act of 1833 defined the ages at which boys and girls might be allowed to work in factories as that of nine years. Between that age and thirteen years children were to work only nine hours, and were to attend school during two hours. Thus the "half time" system was introduced, which was improved in 1844 by Sir Robert Peel's act. That measure provided that children of eight (no longer nine) years of age and up to thirteen might be employed for six and a half hours only, and three days' attendance at school per week was required. Afterwards protective legislation for children was further improved and extended by the Factory Extension Act, and the Workshop Regulation Act, (1878 (Consolidation) Factory and Workshop Act.) Not only textile and other factories in which large numbers of workpeople are employed, but also small industrial establishments, were brought under governmental control. The regulations of the Workshops Act were placed under the control of local authorities. The intention was to ascertain by experiment how far local control might prove equal or superior to central administration. Practically the act was ignored by the local authorities, and further legislation was deemed necessary. This has tended rather in the direction of extending the protection of the law to children in various occupations not coming within the factory system, than of increasing the restrictions upon the employment of youthful labour. The act passed during the session of 1889 for the prevention of cruelty to children, gives to those employed in the-

atrical and other entertainments the benefit of the factory acts. Similar legislation has been gradually adopted in foreign countries. In France, the desire to protect young children from exhausting labour has taken practical shape in recent enactments. In the United States the regulation of labour is not a national concern, but is relegated to the several state legislatures. There has been in recent years a steady tendency in several states, stimulated by the reports of the various "bureaus of statistics of labour," to provide for the protection of children employed in industry. One of the most recent enactments in pursuance of this purpose is that passed by the legislature of New York in 1886, by which any person employing a child under the age of sixteen years as an acrobat, or in any athletic exhibition, or in begging, or in any kind of employment for the purpose of gaining money, is held to be guilty of a misdemeanour. E. H.

CHIMINAGE. Among the special revenues arising from the exceptional position of forest land was a toll on traffic known as chiminage (see FOREST LAWS). The law specifying the persons from whom such toll could be taken, and its amount, is to be found in the Charter of the Forest, 9 Henry III. § 14. The special mention of this toll suggests that it had been made an excuse for unreasonable exaction before the issue of the charter. Under the law so settled no forester is allowed to take chiminage unless he holds his office in fee by the payment of a rent for it; no persons but those who come into the forest to buy bushwood, timber, or charcoal to sell again are to be liable to pay the toll; and all other travellers and even those who came to fetch away brushwood on their own backs without the use of beasts or carts were to pass free. The amount of the toll was fixed at twopence for each cart for each half-year, and one halfpenny for each horse. The toll so limited seems to have formed no grievance, and its amount is usually unimportant. For instance in Sherwood forest in the 15th century the chiminage is farmed out at 6s. 8d. a year. The word is sometimes used for any toll paid for passing along a road.

[*Malwood's Forest Law* (4th ed.), 1717.—*Records of the Borough of Nottingham*, vol. ii., 1883.—*Dr. Murray's New English Dictionary*, s.v., 1889.] C. G. C.

CHITTI, LUIGI, by birth an Italian, passed the greatest part of his life abroad; this explains how he came to write his books always in French. In 1833 he published a *Cours d'économie politique* and in 1839 at Brussels, a pamphlet—*Des crises financières et de la réforme du Système Monétaire*. He had occasion to observe a very severe monetary crisis in Belgium, the origin of which he assigns to excessive emissions of paper money. He proposes the gradual abolition of metallic money, substitut-

ing paper money for it, which, if only not superabundant, cannot become depreciated, a doctrine which is clearly taken from Ricardo's *Reply to Mr. Bosanquet*. Chitti proves himself to be well versed in questions of capital, credit, money, exchange, but is no original thinker.

M. P.

CHOROGRAPH. "A chorogram is the result when different aggregates are indicated by surfaces, showing the size of each, and portions of the surface are coloured or shaded differently to indicate the result of the enumeration in each aggregate. It can be profitably employed to show the different degrees of the occurrence of a single phenomenon in different aggregates."

[*Annals of the American Academy*, Supplement May 1891, "The History, Theory, and Technique of Statistics," by A. Meitzen.] (See GRAPHICAL METHOD.)

CHOSÉS IN ACTION. The term applied by early lawyers to rights of action.

Choses in action were not at common law assignable except in the case of bills of exchange and other negotiable instruments which by the custom of merchants were assignable by indorsement and delivery of the bills. In the reign of Henry VIII. it was held that a chose in action might be assigned as satisfaction for a debt, the assignee to sue if necessary in the assignor's name. Afterwards by various statutes promissory notes, bills of lading, and life and sea policies of assurance were made assignable, but it was not until the 36 & 37 Vict. c. 66, § 25 (6), that it was provided generally that a legal chose in action may be assigned. The assignment must be in writing, and notice of the assignment has to be given to the person liable to pay the debt.

A right of action conferred by a suit in equity was always assignable in equity.

[*Principles of the Law of Personal Property*, by J. Williams, London, 1887.] J. E. C. M.

CHOSÉS IN POSSESSION. Movable tangible property, as opposed to rights of action which are called *choses in action*. Property of this nature could not at common law be held by estates though settlements were always enforced in equity. As compared with real property, choses in possession descend to the administrator or executor, and not to the heir, but title deeds, heirlooms, fixtures and chattels vegetable are exceptions to the rule, as they partake of the nature of real property.

[*Williams's Personal Property*, London, 1887.]

J. E. C. M.

CHREMATISTIC (or MONEY-MAKING). The *locus classicus* on chrematistic is in the *Politics* of Aristotle, bk. i. ch. viii.-xi. The passage is somewhat obscure, from the nice distinctions dwelt on; but the general purport is that there are two sorts of chrematistic—one natural and necessary, being the art of acquiring the material resources to be placed at the disposal of, and

used by, the higher art of economic, of which this kind of chrematistic is the handmaid, whilst the other sort is devoted to the unlimited pursuit of gain for its own sake, without relation to the real wants of the household or the community. The word is now usually applied to systems of theoretical or practical economy which overlook the higher ends of society, and exclude from consideration questions of moral obligation and political well-being (see ARISTOTLE).

J. K. I.

CHRISTIAN SOCIALISM is a name which properly belongs to the propagation of co-operative production or working men's associations by F. D. Maurice and his disciples in the years 1849 to 1853. For its use merely as a name for socialism inspired by Christian motives see SOCIALISM. Its origin is to be found in a letter from J. M. Ludlow to Maurice (March 1848) saying that the socialism of Paris workmen was a real power which would shake Christianity if it were not Christianised. After the publication of Henry Mayhew's letters on the London poor in the *Morning Chronicle*, in 1849, Maurice and his followers at Lincoln's Inn, who had already been trying to persuade the Chartists, in *Politics for the People* (6th May to 29th July 1848), and in discussions at the Cranbourne Tavern, that moral and sanitary reform were of much more importance than extension of the suffrage, turned their attention to economic questions. They were led to deny any beneficence to the operation of self-interest. "Free competition," said Ludlow, "mars everywhere, instead of making, the wisest distribution of labour" (*Christian Socialism*, p. 35). "We have protested," Maurice wrote to Dr. Jelf, 12th November 1851, "against the spirit of competition and rivalry precisely because we believe it is leading to anarchy, and must destroy at last the property of the rich as well as the existence of the poor" (*Life*, ch. ii. p. 83). As a remedy they proposed "Christian Socialism," or friendly association for productive purposes. They sometimes went so far as to imagine a state of things in which all producers might "combine regularly into one body which should, after mutual explanations and by mutual concert, fix the terms upon which each member should dispose of his wares to the others" (Ludlow, *Christian Socialism*, p. 35); but they suggested no principle of distribution on which this agreement should be based. They founded an association of tailors (February 1850) of which Walter Cooper, formerly a Chartist, was manager, and organised a society for promoting working men's associations under a council of promoters among whom were Maurice, Charles Kingsley, T. Hughes, E. V. Neale, and F. J. Furnivall. *Alton Locke*, which represents the ethical side of the Christian Socialist doctrine, was published early in 1850, and was followed by *Tracts on Christian Socialism*, *Tracts by Chris-*

tian Socialists, and the *Christian Socialist*, a weekly penny paper which lasted from 2d November 1850 to the end of 1851. Its place was then taken by the *Journal of Association*, which endured till 28th June 1852. The evidence of the "Promoters" before Slaney's Committee of the House of Commons on "Investments for the savings of the middle and working classes" in 1850, aided in bringing about the legalisation of co-operative societies by the "Industrial and Provident Partnerships Act" of 1852. After the passing of that Act the society for promoting associations was remodelled and the term "Christian Socialism," as employed in this connection, was abandoned. It was offensive alike to theologians, economists, and socialists. The hostility displayed towards the Christian Socialists in many quarters was more due to the name they assumed, and to the vehemence with which Kingsley denounced competition, than to dislike of their Associations, though these were doubtless looked on with some suspicion as copies from French models (see CO-OPERATION, etc.)

CHRISTIANITY AND ECONOMICS

Church, the Mediæval, Economic Influence of, p. 280;
Roman Catholic School of Economics, p. 283; Influence of Protestant Thought on Economic Opinion and Practice, p. 285.

CHURCH, THE MEDIÆVAL, ECONOMIC INFLUENCE OF. The following article is not concerned with the origin of church property or the title by which it is held—subjects which belong rather to the historian or the jurist than to the economist;—it is limited to two points: the influence of the church upon social ranks, and the influence, chiefly in England, of churchmen and ecclesiastical bodies, as landowners, upon agriculture.

1. If it be true that the mediæval church was always the great leveller, that the clerical order was the one profession in which it was possible for a man of the humblest birth to attain to the highest position, this was less by virtue of express enactment than in consequence of the facts, (a) that the church remained free from the distinctions of classes that grew up in the civil state, and (b) that the churchman, as the rule of celibacy became universally accepted in Latin Christendom, could be raised to any rank without the drawback of his founding a family of nobles. The possibility of rising was, it is true, not confined to churchmen: but that

which was the exception among the laity was common among the clergy; and in one important point, with respect to slavery, the exemption of the clerical status from the classes of civil society produced a remarkable relaxation of class conditions.

It was not, however, for many centuries that it became the accepted doctrine that an ordained person was *ipso facto* a free man. At first the only question that arose was that, when a slave was ordained or received into a monastery, his lord was robbed of his service. Accordingly, by a number of ordinances contained in the civil law (*Cod. i. tit. iii. 37*; *Novell. v. 2. cxliii. 35*), and reinforced by ecclesiastical decrees which became incorporated in the canon law, it was repeatedly laid down that no bishop should ordain a slave without the consent of his lord. The rule was not merely intended to protect the lord's rights: it was found also that slaves guilty of crime availed themselves of the refuge afforded by holy orders or admission to a monastery to escape punishment; and churchmen on their side. St. Leo the Great is a prominent instance—objected to the clerical profession being "defiled by the baseness of association" with slaves (*Can. apost. lxxxi. (ep. Conc. Chalced. A.D. 451, can. iv.)*; *Leo I. Epist. iv. 1*).

If, however, in the fifth century it could be conceived as possible that a man might be a clergyman and yet a slave, this idea early gave way before another which presumed that if a slave were ordained with the knowledge of his lord, and without any objection raised by him, he was a free man, though not formally manumitted. It was still, however, conceded that supposing the lord were not aware of the act, he had a right to claim his slave within the space of a year: and that ordination did not for a long time involve of itself emancipation as shown by the enactments in the civil law, that, supposing an ordained slave returns to secular pursuits, his lord may claim him; and that it was lawful to ordain a bondman bound to the soil on his lord's land even without his lord's consent, so long as he continued to fulfil his servile duties (*Novell. cxliii. 17*). This latter rule was soon modified by the provision that the ordained person might perform his services by a deputy (*Novell., l.c.*; cp. gloss. in *Cod. i. tit. iii. 37*)—an arrangement which was accepted by ecclesiastical authority; but on this side it was maintained that in no case could a man in priest's orders be claimed back as a slave (*Gelas. I., epist. in Decr. Grat., dist. lvi. 211*).

So far, therefore, it appears that it was the lord's assent, express or implicit, which made the clerk free; that, failing such assent, the lord was compensated by substituted service; and that a distinction made itself felt between priest's orders and the inferior degrees which

admitted a very large and heterogeneous company of ordained persons to ecclesiastical privileges. It was unquestionably the admission of slaves to the lower orders which led to the gravest abuses; and the prohibition of the ordination of slaves without their lord's consent, which is repeated through Frankish times, (*Karol. Magn. Admon. gen. (a. 789), cap. lvii. (ep. cap. xxiii.)*; *Hludow. Pii, Capit. eccl. (a. 818-819), cap. vi.*), and of which a famous instance occurs in the sixteenth constitution of Clarendon (*Const. Clar. xvi., ep. Stubbs, Sel. Charters (ed. 5, 1884), p. 137*; *Assis. Clar. xx. 1*), was directed principally against this practice. Not merely were the lord's rights infringed, but persons of suspicious character were able to remove themselves from the ordinary jurisdiction of the country. In spite, however, of positive enactments, the view that a priest was necessarily free became extended to the diaconate and the inferior orders; and the petition of the commons in 1391 that the villeins might not be allowed to send their sons to school in order to raise them by holy orders (*qe null neif ou vileyn met ses enfantz de cy en avant a escoles pur eux avancer par clergie*) (*Rot. Parl. iii. 294, cp. Rogers, Hist. of Agric. and Prices (1866), i. 78, 93*) may be taken as proof that by that time the result was established.

With reference to the influence of the church upon slavery outside its own body, there can be little doubt that the humaner principles of jurisprudence by which, at least in England, it was guided were favourable to the bondman (cp. Theodor, *Penit. xiii. 3*; Egbert, *Penit. Addit. 35*). Alike in Francia and in England ordinances were passed moderating the abuses of the slave-trade (*Freeman, Norm. Cong. i. (ed. 3, 1877) 335 seq., 435*), and in these the hand of the churchmen is hardly doubtful. Still more striking is the public action of St. Wulfstan, bishop of Worcester, to whose arguments and those of Lanfranc was attributed the express prohibition by William the Conqueror of the export of slaves (*Stubbs, Sel. Charters, p. 85*; *Will. Malmesb. Gest. Regg. iii. 269*; cp. *Freeman, iv. (ed. 2, 1876) 380 seq.*), a prohibition which was extended by St. Anselm in 1102 to any sale into slavery whatever (*Eadmer, Hist. Nov., a. 1102*; cp. *Freeman, v. (1876) 223 seq.*). The emancipation of slaves was from an early time recognised as a religious act, and the practice of including such a deed in testamentary dispositions was manifestly promoted by clerical persuasion. If religious corporations were not specially forward in manumitting their own bondmen, it was rather because the law of the church was precise against diminishing their property, than through any reluctance to increase the body of freemen. But the process by

¹ Garnier de Pont-Sainte-Maxence's attack upon the constitution (*St. Thomas le Martyr, lines 2488-2490, ed. Hippau, 1859*) rests rather on *a priori* grounds.

which the bondman rose through the ambiguous rank of the vassal to that of the copyholder is traceable to known economical causes and only in isolated cases to ecclesiastical influence.

2. Lands in the possession of a church were distinguished from other real property in so far as they were protected against alienation, and enjoyed certain immunities from the payment of taxes.

(a) According to the civil law, church lands could not as a rule be alienated, though they might be exchanged between two religious corporations or mortgaged up to a limited amount (*Novell. cxx.*) They could only be alienated by an act performed in the presence of the metropolitan and of two bishops of the vicinity (*Novell. xlii. 1, lxvii. 4*). Except as subject to some such condition, alienation was totally forbidden by the early councils (*Cod. Canon. Eccl. Afric. xxvi., xxxiii.*), and by the later canon law it was not permitted *sine iusta causa*, that is without evident necessity or advantage (6 *Decr. iii. tit. ix. 1*). But the power which was reserved of granting leases of land not brought into cultivation made it possible to frustrate the intention of the accepted rule. Setting on one side the numerous cases of alleged unlawful appropriation of church lands by the civil ruler, cases in which there is often reason to suspect exaggeration in the record of the misdoing (cp. Freeman, ii. (ed. 3, 1877) 554-567), we find abundant instances in the Domesday Book and elsewhere, of church lands being granted not merely for life but for several—commonly three—lives (see examples, in Freeman, v. 778-785), at the expiration of which it was not always easy for the grantor to resume possession. By degrees it was attempted to restrict the practice, and the canon law as laid down by Clement V. prohibited all grants for life or even a term of years, allowing them only "ad modicum tempus" (*Clement. iii. tit. iv. 1*), an ambiguous phrase which was afterwards restricted by Paul II. to three years (*Extrav. comm. iii. tit. iv.*)

(b) Among the earliest grants of land to churches or monasteries, in England there are examples in which it appears that the lands in question were entirely freed from the common burthens of property (Bed. *Vit. S. Bened. vi., Epist. ad Ecgbert, xii.*); but soon, as such grants were multiplied, it became a matter of public policy to subject them to the *trinoda necessitas*. With regard, however, to the other payments to which land was liable, the usage varied; sometimes the land was wholly enfranchised, sometimes only in part; sometimes it bought its enfranchisement by payment at the time of the grant or by a surrender of lands in lieu of future obligations (Lingard, *Hist. and Antiq. of the Anglo-Saxon Church* (1845), i. 240-250). Gradually the rule was established that lands held by a church or religious house

were held in "free alms" (*libera eleemosyna*), or FRANK-ALMOIGN (*q.v.*), a form of tenure which is found in Domesday as not exclusively ecclesiastical (Freeman, vol. v. p. 804, *seq.*), and which is legally understood to involve exemption from all temporal dues (Digby, *Introd. to the Hist. of the Law of Real Property* (ed. 3), p. 38; Bracton, iv. 28 f. 207; Ellis, *Gen. Introd. to Domesday* (1833), vol. i. p. 258 *seq.*) On the other hand the liberty thus implied in the possession of lands by the church did not extend to all lands held by the church, nor was it at first admitted by all statesmen. The latter point is sufficiently illustrated by the notorious policy of Randolph Flambard; and as to the former, it is clear that the recognised obligation of the *trinoda necessitas* might naturally be construed in the light of feudal ideas as carrying with it the obligation to feudal military service. That this was in fact the case is shown by the way in which Archbishop Lanfranc—to name no other instance—compounded for the services due from the convent of Christ Church, Canterbury, by maintaining a certain number of knights (*Epist. Cantuar. cclxiii.*; cp. Freeman, v. p. 372); and when in 1159 the imposition of SCUTAGE (*q.v.*) was carried out, it was levied also upon church lands (cp. Joh. Saresb. *epist. cxlv.*) But from the reign of Henry II. onwards, the payment of taxes directly levied on church lands was repeatedly resisted as an infringement of ecclesiastical immunities (cp. Stubbs, *Const. Hist. of Engl.* (ed. 1880), i. 647 *seq.*, ii. 187 *seqq.*, etc.); and it was to prevent a fraudulent multiplication of lands for which such immunities could be claimed that Edward I., in 1279, enacted the statute of Mortmain (*Stat. de Vir. Relig.*, ap. Stubbs, *Sel. Charters*, p. 458 *seq.*)

The lands held by a religious house, at least those in its immediate vicinity, were as a rule cultivated by the brotherhood itself, and the personal interest thus devoted to the work produced better results than the enforced labour of bondmen. The evidence of the Domesday survey goes to show that the church lands were in a higher state of cultivation than other property. The monks also employed themselves in clearing forests, draining marshes, and making roads and bridges (cp. Lingard, i. 267 *seq.*; Cunningham, *Growth of Engl. Industry and Commerce in the Early and Middle Ages*, p. 64 *seq.*, 1890); and the Cistercian order, through the activity which it displayed in sheep farming, promoted in a singular degree the production of the staple commodity of England. Through the immense extent of their property, variously estimated in the 13th and 14th centuries from a quarter to a half of the total landed property of England (Wycliffe, *de Eccl.* xv. p. 338; cp. Pearson, *Hist. of Engl.* ii. 497 (1867)), the churches and religious houses came to take an important share in the industrial development

of the country ; and it is acknowledged that the clergy were mild landlords (see generally Stubbs, *Const. Hist.* iii. 562). The attacks of the Lollards upon the landed property of the church were inspired rather by *a priori* objections to the system itself than by any actual abuses to which it led ; and the considerations which Bishop Pecock, writing in the middle of the 15th century, alleged on the opposite side are probably in the main just. "The treuthe is," he says, "that the tenementis and alle the possessiouns with her purtenauncis, which the clergie (religiouse or not religiouse) holden and halden, is better meintened and susteyned and repaid and kept fro falling into nouȝt and into wildirnes, than if the same tenementis and possessiouns with her purtenauncis weren in the handis of grete lordis, or of knyȝtis, or of squyers. . . . The ternauntis, occupyng tho tenementis and possessiouns with purtenauncis vnder the clergie, ben esilier tretid, lasse disesid, and not greeued bi extorcioun, as thei shoulde be, if thei holden the same tenementis and possessiouns of temporal lordis or of knyȝtis and squyers." Among other points in favour of those who held of the church, Pecock notices that their tenure was less liable to be disturbed than that of those who held under lay lords (*Repressor of overmuch blaming of the Clergy*, vol. ii. p. 370 seq. (ed. Babington, 1896)). It has been noticed by critics least friendly to the mediæval church that it was such causes—the known advantage to the tenant—that did much to reconcile public opinion to the enormous estates held by the church (Pearson, *Hist. of Engl.* vol. ii. p. 502 ; Rogers, vol. i. p. 160). That at the close of the Middle Ages the state of things was somewhat altered, and the abuses which had arisen with respect to the management of church property called forth well-founded complaints (cp. *Dyalogue between a Gentillman and a Husbandman*, 1530 ed. Arber, 1871, p. 134 seq., *Ballads from Manuscripts*, ed. Furnivall (1869), vol. i.), need not be denied ; but the question, which is a very debatable one, lies beyond the province of the present article.

R. L. F.

THE ROMAN CATHOLIC SCHOOL (as the economic school of thought which has developed itself within the Roman Catholic Church has been termed).—The "Roman Catholic School" is of comparatively recent origin. Through the period of its birth cannot be fixed with absolute exactness, it certainly goes as far back as September 1869, at which date a conference of bishops which gave special attention to social questions met at Fulda in Germany.

No doubt the Catholic church, through the fathers in the first ages of Christianity, and through its doctors in the Middle Ages, had always occupied itself with the social question from certain points of view, especially with

regard to the relations between the rich and the poor. Through its agency, indeed, lending at interest had been forbidden by the civil law (see AQUINAS ; CANON LAW ; CHURCH, MEDIÆVAL). But it was not till quite recently that it published a programme of economic reforms, and turned its activity particularly to labour questions. Without imputing any interested motive, it may be supposed that this action of the Roman Catholic church has been not uninfluenced by the desire to regain the power over the labouring classes which socialism threatened to wrench from its hands. Up to the present time, however, this object does not appear to have been attained. In spite of the armies of workmen which the church leads as pilgrims to the feet of the Pope, in spite of the "workmen's clubs" (*Cercles ouvriers*) which the church strives to multiply in France, no profound impression seems yet to have been made on the masses of the labouring population ; and it is from the ranks of the higher clergy and the aristocracy that it has almost exclusively drawn its leaders and even its adherents.

In England the late Cardinal Manning was prominent in labour questions. In the United States, Cardinal Gibbons has undertaken the defence of the Knights of Labour. In France Cardinal Langénieux, Comte Albert de Mun—an ex-cavalry officer and one of the most eloquent speakers in the French legislature, M. Harmel—a large manufacturer,—all three are organisers of workmen's pilgrimages. In Switzerland, M. Decurtins, deputy of the canton of the Grisons, has taken an active part in the labour laws passed in Switzerland of late years. In Germany, the Bishop of Mayence, Monsignor von Ketteler, now dead, was one of the initiators of the movement ; at present there is the Bishop of Breslau, Monsignor Kopp, who played an important part at the International Conference of Berlin on the regulation of labour. In Austria, there have been Baron de Vogelsang, now dead, the Prince of Liechsteinstein, and others. Pope Leo XIII. has placed himself at the head of the movement. On several occasions he has shown great interest in social questions, especially by his famous encyclical of 15th May 1891 and his addresses to the workmen pilgrims.

By the vehemence of its criticisms of the economic organisation of the day, more particularly by opposing itself to individualism, self-help, competition, and the inordinate search for gain, also by the sombre picture which it paints of the condition of the working classes, the "Roman Catholic school" makes common cause with democratic socialism. Like it, indeed, it protests against *Manchesterism*, against the body of teaching which regards personal interest as the only motive force of human activity, and the law of supply and demand as the sole regulator of wages. Hence

the appellation of "Catholic socialism" which it sometimes receives. However, it always refuses to accept this title. Indeed, it stands really at the opposite pole to the socialist school, for its objects are not only to *conserve* but also to *restore* the fundamental institutions of society, *id est*—religion,—family,—property,—employer system. It sees the solution of the social question, first of all, in the fulfilment of the laws of morality and religion, then in that *corporative system* which, in the words of Leo XIII., "comprises in itself almost all other works." This corporative system must not be confused with the co-operative system, so much extolled by some of the Protestant schools of socialism, or even with trade-unionism. The "Roman Catholic school" understands by this phrase associations of trades, composed at *one and the same time of masters and of men*, regulating in sovereign fashion, and by decrees fitted to each particular industry, the number of hours of labour, the rate of wages, and so forth; and invested with the rights of property in consequence of their status as corporate bodies, and with political power through their ability to elect their representatives in the chamber. The works of M. Harmel in the Val des Bois near Rheims are usually given as a type of the industrial organisation which is the ideal of this school.

In France and in the countries which have felt the influence of the French Revolution and of the movement of ideas which thence took its rise, the "Roman Catholic school" violently attacks the Principles of '89, holding them responsible for the state of agitation and unrest through which the nations of Europe are struggling. Thus the law of equal division of estates between all the children is regarded by the "Roman Catholic school" as the chief cause of the disorganisation of the family, whilst from the abolition of the corporative system the misery of the working classes is held to have mainly arisen.

The question of state interference has caused the division of the "Roman Catholic school" into two clearly-marked sections. The interventionist school, the names of whose representatives have been given above, labours steadily for state interference to regulate the length of the day's labour, for the enforcement of Sunday rest, for the abolition of usury, for the prevention of monopoly and speculation; in fact, for all measures which seem likely to raise the condition of the poorer classes. On the other hand, the "Liberal" section of the "Roman Catholic school" entertains a distrust of state interference in a coercive shape, which is no whit less than that felt by the economic school of Adam Smith. It sanctions the application of state interference only in cases of clearly-proved necessity, and upholds liberty of labour and freedom of contract. It is also less

bitter in its criticisms of the economic organisation of the day and confines its programme of social reform to the restoration of the authority of the church in society, of the father in the family, of the employer in the workshop, and to the exercise of social duties. Further, its characteristics are more of a lay nature; it refuses to be called "Catholic" in the narrow sense of the word, and opens its arms to all who desire to apply the historical method to the study of social facts. M. LE PLAY (*q.v.*), who died in 1883, is usually regarded as the chief of this school, which includes among its members several distinguished professors, for instance M. Claudio Jannet, professor at the Catholic university of Paris; Charles Périn, formerly professor at the university of Louvain, and his successor in the same chair, M. Victor Brants. It was believed that the Pope would give his opinion on the delicate point involved in these discussions in such a way as to decide the question. But the holy father, in his encyclical of May 1891 *de Conditione Opificum*, expressed himself in such general formulæ and made use of such diplomatic and guarded language, that each of the two sections of the school has been able to claim his high approval. Thus the encyclical declares "that the force and authority of laws are necessary to save the unhappy workman from those speculators who treat men as if they were machines,—who use them up in order to glut their own insatiable cupidity." Nevertheless, it also condemns state socialism "which aims at substituting state control for paternal care." Moreover, in his address to the workmen pilgrims on 19th September 1891, in which he commented on his encyclical, the Pope declared "that it must be taken as certain that no true and practical solution of the labour and the social question would ever be found in purely civil laws, however good they might be." It is therefore probable that these two main lines of thought—the one seeking a remedy for all human ills by methods closely allied to those of socialism, the other by strictly religious influences,—will continue to divide the "Economic school" now existing in the Roman Catholic church.

[Francesco Nitti, *Il socialismo cattolico*, 2d ed., Roux, Turin, 1891.—"The Catholic Church and Economics," J. J. Keane, *Quarterly Journal of Economics*, Oct. 1891.—C. S. Devas, *Political Economy*, London, 1892. The Journals and Reviews which are the organs of the "Roman Catholic school" are very numerous. The following are the most important in France: *L'Association Catholique*, a monthly review (organ of the school of the Comte de Mun).—*La Réforme Sociale* (organ of the school of Le Play).—In Germany: *Arbeiterwohl*, conducted by Abbé Hiltz.—*Historisch-politische Blätter*.—*Christlich-soziale Blätter*.—In Austria: *Oesterreichische Monatsschrift für christliche Social Reform*, formerly conducted by Baron de Vogelsang; *Das Vaterland*.] c. g.

THE INFLUENCE OF PROTESTANT THOUGHT ON ECONOMIC OPINION AND PRACTICE.

The intention of this article is to trace the influence of Protestant thought, mainly on the continent of Europe, both in its original tendencies and in its historical development on economics. The outcome of these influences may be generalised under four heads, viz.: I. the principle of *Individualism* encouraging individual enterprise, the stability of private property, and the development of industrial progress; II. the principle of *libre examen* (the expression is that of Guizot), which in freeing the mind led indirectly to the liberation of trade, free competition, and the doctrine of *laissez-faire* as further developed by the French revolution; III. the Protestant *idea of the state* during the transition period, which helped in establishing the mercantile theory in Holland and England, and the cameralistic conception of political economy in Germany, since economic science was then regarded merely as a method of action, the object of which was the furnishing the state or its head with ways and means to carry on the government; IV. Protestant *ethics* in relation to the modern economic method, introducing the *Caritative* element of Christianity (*i.e.* that not only the selfish principle of supply and demand but Christian love and duty should be the guiding laws in economic action—the doctrine of Adolph Wagner) as a corrective of the purely egoistic theory.

I. INDIVIDUALISM.—Friends and enemies, Guizot, Soehlin, K. Marx, and E. de Laveleye, declare alike that the "history of capital and the supremacy of private interest," *i.e.* commerce in its modern aspect, commenced contemporaneously with the period of the reformation, accompanied as that movement was by many discoveries and inventions, and the recovered sense of personal freedom and responsibility. In *Protestantism and Catholicism in their bearing upon the Liberty and Prosperity of Nations*, by Emile de Laveleye (1875), the progress of economic enterprise is attributed to the superior education and enlightenment fostered by Protestantism, De Tocqueville ascribing to the Puritan discipline of the first settlers the same result in the commercial expansion of the United States. From Luther to Protestant

divines of the present day the moral force of the dignity of labour and the duty of cheerful exertion in the subduing the earth by economic effort, have been held up to admiration, and have given an impulse to the economic life of Protestant countries. The *Wealth of Nations* appeared in 1775-76, and marks a revolution of thought in Protestantism in the author's mind, and a revolution of industry then commencing. "The machine is somewhat in the nature of Protestantism," says Dean Uhlhorn in his brochure on *Katholicismus und Protestantismus gegenüber der socialen Frage* (1887). Private property is encouraged by Protestantism. Luther, in his *Sermon on Usury* (1579), speaks of three grades "of dealing well and worthily with temporal goods." The highest is to allow ourselves to be despoiled of it without offering opposition, the lowest is to take neither profit nor interest, though he sees objections to this ideal being realised. Whilst Erasmus complained of the "rage of ownership," Protestantism endeavoured to make a compromise, maintaining the ideal in theory and encouraging what Fr. A. Lange calls a "moderate egoism," or "ethical materialism," in practice (see *Geschichte des Materialismus*, i. 254, 294. Cp. J. E. Thorold Rogers on *The Economic Interpretation of History* (1888), p. 83). Besold in the 17th century speaks of private property as of human origin, yet approved of in Holy Scripture. H. Grotius, at the head of the classical school of political economy in Holland, defends it. Pufendorf adopts it from him, and the theory dominated the old-fashioned economics in Prussia, until the new school of economists, with Ad. Wagner at their head, pointed out the importance of correcting the rigid theory of private rights as to property by the recognition of what is due to the community, and thus reconciling the principle of private interest with that of public advantage. This naturally followed on the growth of altruistic ideas affecting alike Protestant and economic thought. II. LIBERATION OF INDUSTRY follows logically from that of liberty of thought, developing the five points of industrial independence: freedom of labour, free trade in land, free movement of capital, freedom of industrial enterprise, and a free market regulated by demand and supply,—it further implies the removal of all governmental and trade restrictions. But between the original conception of these principles in the 16th century, and their realisation in the 18th, lies the intermediate economic period of III. MERCANTILISM, the reign of the "regal theory" of political economy as then held in Germany. It means that the object of all economic effort, and legislation directing it, is for the benefit of the state and its head. This view of directing the economics of the nation by royal mandate is encouraged by the Protestant idea of the state. With the

break-up of the old feudal and ecclesiastical systems of social organisation a fusion is effected of all private and corporate economies in one *political* or national economy. The whole community assumes the character of an economic society, while it is directed by the central power,—absolute monarchy (*Geschichte der Nationalökonomie* von H. Eisenhart, 1881, pp. 6, 7; also *Bau und Leben des sozialen Körpers*, von A. E. Fr. Schäffle, vol. i. p. 17, 1875). Thus Luther favoured state magazines for providing the people with food. In England the secularisation of church property became a measure of state policy, and, in turning public into private property in land, had very important results to the rural economy of the country (see T. E. Cliffe Leslie's *Land Systems*, p. 213 *seq.* and *passim*). Measures affecting commercial tariffs for the encouragement of native industry, even the proposal of graduated taxation for the purposes of mitigating the evil effects of a debased currency, and the rapid growth of pauperism, which K. Marx attributes to the contemporaneous rise of Protestantism and commercial industry (see *Das Kapital, Kritik der Politischen Oekonomie*, 2d ed., 1872, p. 750 *seq.*, and cp. p. 128 *ib.* on the progress of capitalism in Protestant lands), all these affected the development of economic science at this time. It simply became a method for increasing the resources of the country. Roscher shows how closely connected such questions were with the doctrine of mercantilism (see MERCANTILISM). Bornitz, Besold, Klock are the German representatives in the earlier part of the 17th century of this stage of economics as a science of state finance. Petty, Locke, North represent the same tendency in a more advanced state in England. Cromwell's Navigation Act (1651) is a practical illustration of it. They show the influence of Protestantism, encouraging national egoism as a national duty. In more recent times the various forms of state-legislation, favoured by Prince Bismarck under the name of "practical Christianity," or of government interference with factory labour, as promoted by Lord Shaftesbury in the name of Christian philanthropy, as well as the previous liberation of the Prussian peasantry by Von Stein, and the "organised benevolence" of Wichern and Huber, the pioneer of German co-operation, are all the outcome of Protestant Christianity and patriotism combined, with a view to give effect to the theory of "freedom of person and property under a simple and strong government." IV. The ETHICS of Protestantism, as modified by the philosophy of Fichte and Hegel, have exercised a profound influence on the principal writers belonging to the modern "historical school" of political economy in Germany. The state now comes to be regarded as the *ethos* or representative of what is best morally in the

community, and the church in alliance with it as the upholder of a higher ideal of the economic man. Thus in the *Handbuch der Politischen Oekonomie* (1st ed., 1882; 3d ed., 1890), among whose contributors we mention, as members of the historical school, L. Brentano, H. von Scheel, and Ad. Wagner, who lay stress on the importance of Protestant Christianity, we are told that ethics teach "social man the duty of not only following egotistically his own interest, but also the welfare of others, and unselfishly to provide, according to his ability, the community with the requisites for the material and spiritual elevation of his fellows" (p. 49, 1st ed.) The state is defined as the grandest moral institution, bound to use its force in the pursuit of all economic interests, and by rational state-intervention to supplement the deficiencies of self-help (*ib.* pp. 52-54). Wagener, the privy councillor (to be distinguished from Ad. Wagner the professor, several times mentioned in this article), as a leading Protestant layman in Prussia, and Bishop Martensen, as a Danish churchman, both look up to the state as the power which should bring about "a just distribution of the common social product of all for all." Sismondi, representing Genevan Protestantism, was one of the first to discard on religious grounds the supreme rule of *laissez-faire*, and calls on the state "to regulate the progress of wealth," defining political economy as *la plus sublime Science de la bienfaisance*. Schäffle, as the representative of South German Protestantism, is the most cautious, as well as, next to Roscher, the most erudite advocate of this theory, which makes man, not money, the object of all economic exertion, and in which humanistic Protestantism and economic humanism may be said to be mixed and merged. By humanistic Protestantism we mean the modern form of it, which lays stress on the humanities taught in Christianity, and by economic humanism we mean the more recent efforts to treat political economy as a science which has for its object the improved condition of humanity as a whole. The question is no longer, says Roscher, "what are the laws of political economy, but what ought they to be,—not an inquiry into the principles which govern the accumulation of wealth, but as to what is man in his economic relations, what he does, what he wants, what he is to be" (*Geschichte der National-ökonomik in Deutschland*, 1874, pp. 1033-34). To conclude, from the days of Luther to those of Leibnitz, and down to our own times, Protestantism, faithful at heart to its original aim, the liberation of the mind,—though for a time diverted from this object by yielding to the opposing opinion—submission to dogmatic assertion,—again accepting the simpler doctrines of earlier Christianity,—has continually exercised a weighty influence on

the evolution of economic thought. Political economy itself is regarded by one school of the present day as having gone through somewhat similar successive stages, establishing at one time as its foundation the principle of sturdy self-dependence, accepting at another the silken fetters of state tutelage, then passing on to the absolutism of scientific dogmatism during the era of "liberal mammonism," and rising at last to an ethical conception of its mission as the science of a free yet harmonious organisation of industry, destined to attain the highest economic interests of mankind, the highest developments of human culture.

[Frederick Seebohm, *The Era of the Protestant Revolution*, 1874.—M. Guizot, *De la Civilisation en Europe*, sixième ed., 1861, Douzième Leyon.—W. Hohoff, *Protestantismus und Socialismus:—Historisch-politische Studien*, Paderborn, 1881. The chief value of this work consists in its quotations from Comte, L. Blanc, and German authorities on the economic influences of the Reformation from a Roman Catholic standpoint, see especially pp. 8-116, 162-168.—Alexis de Tocqueville, *De la Démocratie en Amérique*, 16ème ed., 1874, tome 3ème, pp. 8-10, 42, 213-215, 226-227.—Friedrich von Baerentzen, *Die Socialwissenschaften* (1882), pp. 241, 244, 278.—T. E. Cliffe Leslie, *Essays on Political and Moral Philosophy*, p. 167 seq., this passage having been originally published in the *Fortnightly Review*, July 1875.—A. E. Fr. Schaffle, *Das gesellschaftliche System der menschlichen Wirthschaft* (1873), i. p. 41; ii. 15, 527-528.—*Idea and Leben* (as loc. cit. supra), i. 691-693.—C. Kautsky, *Thomas Morus*.] M. K.

CHRONOGRAM AND HEXOGRAM. Chronograms and hexograms are diagrams "showing the intensity of a phenomenon at various periods of time, by the rise and fall of a curve within a system of co-ordinates expressing a measure and time. If this occurs in an automatic register, observation and representation take place simultaneously. But the hexogram may also be constructed later" (see **GRAPHICAL METHOD**).

[*Annals of the American Academy*, Supplement, May 1891, "The History, Theory, and Technique of Statistics," by A. Meitzen.]

CHURCH-SEED (*cherchesed, chercheomer, cherlesseep*). "A certain measure of threshed wheat that every man was bound to bring to the church, in the time of the Britons and Angles, on St. Martin's Day. But, since the coming of the Northmen, many lordships took it to their use and gave it according to the ancient law of Moses by the name of "first fruits," as you will find in the letters of King Knut that he sent to Rome, and is called church-seed *quod sicut solumus*." The above definition is given in the *Expositio vocabulorum* in MSS. St. Paul's. Liber Pilous, Red Book of Exchequer, and other Anglo-French glossaries of the 12th century. In the Saxon laws, however, under the head of *De primitiis seminum* we read

"And church-scot at Martinmas; and whosoever holds it over that day let him pay it to the bishop and indemnify him xj fold and to the king 120s." (Cnut, *Eccles. Dooms*, 8). From this it would seem that the word is a corruption of church-scot (*cherchescaet*)—the "c" becoming mute—and in the Norwich MS. of the glossary the termination is given as "soht."

H. Ha.

CIBRARIO, GIOVANNI ANTONIO LUIGI, Count, was born 1802, in Turin. He entered the service of the Sardinian government 1824, was entrusted in 1832 with diplomatic missions in Switzerland and France, and in 1833 with Austria, and took possession of Venice on the 7th of August 1848 in the name of King Charles Albert of Sardinia. In 1852 he was appointed minister of finance in the cabinet of D'Azeglio, and in the same year became minister of public instruction. In 1855 he was appointed minister of foreign affairs. He died at Salò (Brescia) in 1870. This distinguished statesman has written an amazing quantity of historical studies, principally concerning the house of Savoy. As an economist he owes his fame to two books, the *Storia dell' economia politica nel medio evo* (2 vols., Turin, 1839), translated into French, with a preface by Wolowski (in 1859, Guillaumin, Paris), and the historical treatise *Della Schiavitù e del Serraggio e specialmente dei Servi agricoltori* (2 vols., Milan, 1868-69). Besides these larger works, some financial essays, reprinted in his *Opuscoli* (Turin, 1841), should be mentioned. M. P.

CINQUE PORTS. The name applied to the five towns of Hastings, Sandwich, Dover, Romney, and Hythe, which were incorporated for the defence of the realm and other purposes probably by Edward the Confessor. The "ancient towns" of Winchelsea and Rye, and several other places, corporate and non-corporate, were afterwards added as members. Some writers have tried to identify the five leading ports with the five Roman fortresses, which, under the *comes littoris saxonici*, guarded the south-eastern shore, but the better opinion seems to be that they were of Teutonic origin. It is probable that the trading interests of the ports first brought them into prominence. The inhabitants were fishermen, and they were accustomed to resort northwards a considerable distance to the banks at the mouth of the Yare to dry their nets and pack their fish. This practice developed into an important annual fair at Great Yarmouth, which was attended by fishermen and traders from various parts of the Continent. The maintenance of order, and the exercise of jurisdiction at this fair belonged to the portmen from the earliest period of their history. Professor Montagu Burrows (*Cinque Ports*, London, 1888) traces the origin of all their distinctive institutions to their connection with this fair.

Jurisdiction was exercised in the "Court of Shepway," a body composed of the bailiff, and a certain number of freemen from each port, but the assemblies known as the "Brodhull" and the "Gestling," usurped its administrative powers, and the Lord Warden and his courts of admiralty, chancery, and pilotage, gradually encroached on its judicial powers.

The chief duties of the assembly were as follows: (1) to exercise jurisdiction at Yarmouth fair; (2) to fix the number and size of ships to be furnished for the defence of the realm; and (3) to safeguard the franchise of the ports.

The ports were at the height of their power during the reigns of John, Henry III., and Edward I., when their ships constituted the only existing English navy. During the 15th and 16th centuries they gradually declined owing to the filling up of their harbours, the necessity of a state naval organisation, and the growth of other commercial seaports. The assemblies still continue in name, and the Lord Warden may exercise certain minor judicial functions.

CIOMPI (name supposed to be derived from the Fr. *compere*, used by the French soldiery of the Duke of Athens). The sudden uprising of the Ciompi in Florence, 1378, was one of those movements in Europe which took place during the half-century subsequent to the Black Death, and may possibly be regarded as due to the dislocation of industrial conditions brought about by the diminution in the numbers of the people. Immediately, however, the movement in Florence was due to (a) the rising of the lower guilds against the upper, especially against the great wool guild; (b) reaction against Guelphic tyranny; (c) political restlessness of the populace. Regarded from the standpoint of history, the rising of the Ciompi may be said to have been successful in bringing about a relaxation of the excessive domination of the greater guilds, but its effects at the time were somewhat various. At first it was entirely successful, the inferior guilds obtaining a much greater power, and the guild of the *popolo minuto* being established, but in 1382 the force of reaction led to the abolition of this latter, and to a considerable restriction of the advantages attained. The ground gained was, however, not entirely lost.

CIRCULATING MEDIUM. The circulating medium in all civilised countries consists at the present time to a very large extent of orders to pay sums of money in the form of bills and cheques. At the present time "Bank notes are no

more than the mere small change of the ledger" (Newmarch, *Address as President of the Section of Economic Science, British Association*, Manchester, 1861). Coin plays a large part in retail trade, but its share in the more important transactions is now comparatively small. The circulating medium at the present time in this country may be said to consist of cheques, bills of exchange, notes, and coin; to these book transfers, where the accounts are under the same administration, may be added (see BANKING; CASH; CLEARING SYSTEM; CURRENCY.)

[For details "Paper on the Proportional Use of Credit Documents and Metallic Money in English Banks." G. H. Pownall, *Journal, Institute of Bankers*, October 1881;—other papers in same journal, and those of the Statistical Societies of London and Manchester, etc.]

CITATION. See JURISDICTION, SCOTCH.

CITATION. A document issued by the High Court in probate and divorce matters. Probate actions, which were formerly begun by the service of a citation on the defendant, are now opened by the issue of an ordinary writ of summons, but "citations to see proceedings" may be served on third parties who may possibly be interested in the matter, so as to bind them by the result. In divorce proceedings a citation is "extracted" and served on the respondent and the co-respondents immediately after the filing of the petition.

E. S.

CITÉ OUVRIÈRE. This term is applied by French economists in a general sense to blocks of buildings rented to working-class families on such conditions that they may by payment of fixed instalments become the owners of their houses. The best known instance on the Continent is that at Mühlhausen, where there is a settlement of 7000 persons, mostly employed in the industries of the town. Used in this sense, it is equally applicable to groups of workmen's dwellings in England and America which have been purchased by the occupiers through the medium of building societies or co-operative banks. But the term is used in a narrower sense to describe the famous *Familistère* founded at Guise by M. Godin. The *cité ouvrière* may be roughly described as an attempt to reconcile the capitalistic enterprise of the modern world with the craft association of the mediæval world. It is not a municipality established to provide for certain common wants out of revenues levied on individual inhabitants, but it is a manufactory so managed that its surplus profits are appropriated to develop human nature in all its mental, moral, and physical relations. The supervision of the municipality may be said to be superseded by the organisation of industry. Sanitation, education, and poor relief are all provided by a voluntary apportionment of the net rewards of common work, and public opinion takes the place of police. Perfect freedom of voluntary

association has eliminated the force of compulsory association. The city is dead but the citizen is alive, and the church based on labour has overcome the state, whose basis is taxation. The settlement at Guise, where this form of city life has been developed to the highest point (see the *Co-operative Traveller*, by E. O. Greening, Labour Association, 1 Norfolk Street, Strand, 1888), comprises about 86 acres, of which 11½ acres are covered by the iron works, 25 by public gardens, and the rest by the social palace, schools, institutes, and surrounding grounds. The iron works were opened by M. GODIN (*q.v.*) in 1846, and from that date up to 1852 he was gradually building up the business. An ardent disciple of the school of Fourier, he was determined to use his business as a means of elevating his employés, and he began to carry out his ideas by reducing the hours of labour, abolishing fortnightly payment of wages, altering the pay day from Saturdays to Thursdays and Fridays, and establishing a sick club governed by a committee of workmen. In 1859 he bought 15 acres of ground and began to build the first wing of the FAMILISTÈRE (*q.v.*) or social palace for his workpeople to live in. Building after building, institution after institution, have been added to the original plan, and now the settlement not only includes a co-operative store with departments for grocery, bakery, confectionery, drapery, boots and shoes, coals, butchery, and every article of prime necessity, but it provides its members with employment in a gigantic iron work, houses them in palatial buildings, nurses their babies as far as their mothers desire it, educates their children, provides library, news room, billiard room, refreshment saloon, theatre, music master, doctors and dispensary, assists them to wash and dry their clothes by machinery, assures them against the needs of old age, the accidents and ailments of life, and the loss by death of the wage-earner, and furnishes them with all the luxuries of life, including a co-operative garden filled with fruit and flowers. How has all this been done? The answer is, by the capitalist sharing the profits of the iron foundry among the workers, instead of keeping them all to himself. In 1877 M. Godin commenced the plan of sharing profits by giving a bonus on wages and accumulating the sum for the wage-earners. In 1880 he formed the works, social palace, etc. etc., into one great co-operative society with certain provisions for the whole becoming the property of the workers. The accumulated bonuses of the workers then amounted to £10,490, and the share capital held by M. Godin to £150,000. The division and appropriation of profits for the future were fixed as follows:—after payment of material and wages at market prices, a preferential 5 per cent of the gross profits goes to interest on capital

and the remainder is divided in certain proportions between capital, labour, the latter including mental as well as manual labour, and social and benevolent institutions. There were, in 1884, 1452 persons employed in the foundry, and they were divided into five classes: (1) the director—M. Godin was director for life, and after his death he was succeeded, in 1888, by M. Dequenue, one of the workers; (2) a committee of nine; (3) 64 associates, persons of not less than 25 years' age, of 5 years' employment on the works, with capital of £20; (3) 148 sociétaires or special members who had worked 3 years; (4) 574 participants or ordinary members of 1 year's work and not less than 21 years' age; (5) 656 auxiliaries of less than 1 year's work. Besides these there were 209 outside shareholders who had been workers but had gone elsewhere or were on military service. Classes (1) and (2) receive special remuneration for management, (3) and (4) receive proportionate bonuses on wages accumulated as share capital, while class (5) only enjoys the benefits of a medical provident fund. From 1880 to 1884 over £115,000 of profits had been appropriated to the workers, partly in share capital about £100,000, partly in cash, about £10,000, and about £5000 in education, and since that date the share of the workers in the business has been steadily increasing. At M. Godin's death it amounted to about one half of the whole capital.

CITIZEN. The term citizen ought logically to be exactly correlative with the term city; but in actual usage this correlation is not observed. The term citizen is used to express three distinct shades of meaning; sometimes as equivalent to "member of a sovereign state" sometimes as equivalent to "member of a body of townsmen invested with municipal rights," sometimes as equivalent to "dweller in a town" as distinct from "dweller in the country." The title of a well-known series, the "English Citizen series," exemplifies the first of these uses; the second is exemplified in such a phrase as "the mayor, aldermen, and citizens of Liverpool"; and there would be no gross impropriety in speaking of the "citizens of Constantinople" although Constantinople is neither a state nor a municipality. When used in the first sense, the term "citizen" connotes more especially the rights and privileges, as the term "subject" connotes more especially the duties and burthens, of membership in a body politic. For this use of the term citizen is derived from ancient usage. The fully qualified citizen of an ancient city was member of a sovereign state, and within its bounds was a highly privileged person as

compared either with the slave, with the serf, or with the alien. The associations of the term "subject," on the other hand, are derived from the imperial and feudal phases of political society. The political changes of the last hundred years have lessened the interval between ancient and modern conceptions of political society, and have made the use of the term "citizen" in the above sense increasingly common. In the second sense referred to, as expressing membership of a body of townsmen invested with self-government, the term "citizen" has had a more continuous use. The establishment of the Roman Empire reduced the free cities of antiquity from sovereign states to municipalities. It was only as burgesses of one or other of these municipal towns that the inhabitants of the rural districts had any rights of self-government. In the Middle Ages self-government attained its full growth only in the towns, being restricted in the country by the power of feudalism. In some mediæval cities—in those of Flanders, of Germany, and above all of Italy,—municipal self-government expanded into something like the sovereignty of the Greek city. It is only in modern times that town and country have been generally assimilated in point of self-government. In the third of the above senses, as expressing no more than the fact of dwelling in a town, the term "citizen" is of comparatively little import for politics or economics (see CITY: ANCIENT; MEDIÆVAL; MODERN). F. C. M.

CITY

Ancient, p. 290; Mediæval, p. 292; Modern, p. 295.

CITY, ANCIENT. The city with its correlative ideas of citizen and citizenship is the special feature of the stage of political development reached by the ancient civilisation of Europe. Cities are to be found in the history of oriental civilisation along the river valleys of the Nile, Tigris, and Euphrates; but they were hardly more than gigantic collections of walled-in populations depending for their existence on the conquest of some monarch or the cult of some god, and destitute of any inherent life of their own. The inhabitants were slaves and serfs rather than citizens. It is ancient Greece and Italy that gave birth to true city life, the life of self-governing freemen; and the political history of these countries is the history of a number of cities, their growth, their revolutions, their wars and their alliances, their conquests and their defeats. This preponderance of city life is reflected in Greek and Latin literature. To the ancient Greek city, society and state seemed identical terms, and Roman statesmanship knew no other method of conciliating the conquered than that of enrolling them on the civic registers of Rome. The history of the conquest of the European world by Rome is in fact the history of the conquest and founda-

tion of a multitude of cities, and of their connection by a system of roads. The Roman empire was mainly a confederation of cities under an emperor or chief magistrate elected by the citizens or soldiers of the conquering city, and, when it fell, the cities that were its members survived as units of government, and the roads that connected them as channels of commerce for modern civilisation.

The *origin* of the Greek or Italian city is lost in the legendary past, but in all probability it grew out of the union of some great leaders of patriarchal clans or families, who, after subduing the aborigines, seized on and settled round some commanding position, safeguarded their new settlement with walls, and sanctified it with religious worship. The city-state thus began as a military, but soon became a commercial colony. Around the original dominant families, supporting themselves by the produce of the surrounding fields, cultivated by the help of the conquered natives, and submitting, for all the purposes of mutual protection, to the combined government of the heads of the families or clans, there would be gradually collected a mixed population of settlers, traders, and refugees. The latter contributed to the wealth and importance of the settlement, but had no voice in its management. As these outsiders grew in numbers—and this was especially the case in maritime settlements—and were called on to assist in protecting it, they naturally claimed a voice in deciding questions of peace and war, in dividing the spoils, and in making laws. The internal history of these ancient cities is largely taken up with the struggles between the bodies of old and new settlers for political power. In some cities the old families held their own, and then the government was called an *aristocracy*, in others the wealthier classes belonging to the old or new families secured power, and then it was called an *oligarchy*, in others the mass of independent inhabitants gained power, and then it was called a *democracy*. Often these various forms of government alternated with each other according to external or internal changes of conditions, and sometimes a single individual, relying on the support of the excluded classes, seized the reins of government, and then it was called a *tyranny*. Except in cities like Athens, Sparta, and Rome, where conditions were, for a long time, especially favourable to one form of government, the political equilibrium remained very unstable.

The *political power* for which the inhabitants of an ancient city contended was something unknown in the mediæval and modern world. (1) each city with the country dependent on it, was originally no part of a larger state or system to whose authority it had more or less to bow, but was an independent sovereign power, waging war and making peace on its own account, like the governments of large

European kingdoms in the present day. The chief officers of the city had not merely to preserve peace at home, they had to defend it from foreign foes, they had to play the part of generals and diplomatists as well as of magistrates and councillors, and each citizen had to be ready to fight as well as to vote, to run the risks as well as reap the rewards of war. (2) the city was, in the eyes of the ancient citizen, his church, and the city magistrates were *ex officio* priests. He might continue to take part in the ancestral worship of the family, the clan, and the tribe, but the gods and temples and ceremonies of the city overshadowed the divinities and altars and festivities of the hearth; and where, as at Athens, the state religion gave rise to the state drama, the city wielded the power of the pulpit and the stage. Everywhere the secular arm of the state was supported and consecrated by its spiritual authority, and patriotism and piety became indissoluble sentiments. Exile carried with it all the terrors of excommunication, and the cityless man became a social outcast without gods and without duties.

One consequence inevitably followed from the supreme position of the city-state. The individual liberty of the citizen was greatly curtailed, and against the demands of the state he had no rights. In such a small community the tax upon person and property was universal and practically unlimited, and private life was never free from state interference. There were state regulations about dress, food, marriage, exposure of deformed children, education, religious observances, political services, succession to property, and indeed very few matters were left to individual choice and conscience. Civil liberty, as we understand it, did not exist. The liberty of the ancient citizen was twofold—political and personal. He was free from the dictation of any person outside the city, and he was free from the dominion of any person inside the city. He was neither the subject of a king nor the slave of a master, but he was the servant of the constitution. Whether the constitution was aristocratic, oligarchic, or democratic, the essence of citizenship was everywhere much the same. It consisted in the privilege to own land, to serve in the ranks of the heavily armed soldiery, to vote at the civic assembly, to elect and be elected to office, deliberative or judicial.

The government of the city-state always turned on the general assemblage of the body of citizens, whether the title to citizenship rested on birth, wealth, or personal freedom; but subject to this principle, the functions of government were distributed, and the control of government exercised very differently under an aristocratic, oligarchic, or democratic system. Under the latter system, as developed at Athens, the public assembly was practically

omnipotent. It supervised all the chief functions of government, it voted taxation, it debated on and passed laws, it appointed sub-committees to act as courts of justice and financial and administrative commissioners, it elected its executive officers, it exacted an account from every official at the end of his term of office, it received ambassadors, and decided questions of peace and war. The distinction of judicial, legislative, and executive powers was recognised, but the division rejected. In an aristocratic or oligarchic constitution a large portion of the functions of government was invested in irresponsible officers, or in a small council of state, elected possibly by the whole body of citizens, but rendering no account to it. There were also mixed forms of government to be found, such as that of ancient Rome, where the popular assemblies were large, but had little practical control over state policy, which was directed by the senate, consisting of all those who held or had held the chief executive and judicial offices of the state. Below the citizens, occupied chiefly with war and politics, are to be found in most city-states a body of inhabitants not possessing political rights, but enjoying a large amount of civil privileges in return for special taxation. These aliens consisted either of conquered "natives," cultivating the soil in a serf-like dependence on the citizen owners, or immigrants carrying on commerce in a more independent condition. Many of the latter might have been citizens of some other city, and were from time to time, under a democratic régime admitted to the full privileges of citizenship in their adopted place of residence. At the bottom of the social structure in every city-state came the slaves. No form of constitution in the ancient world made any difference in this respect, and a democracy of freemen was at bottom an aristocracy of slave-owners. Thus at Athens and in the dependent country, there were at one time over 400,000 slaves, as against 10,000 resident aliens and 21,000 male citizens of full age; and at Rome the increase of slaves was prodigious as conquests extended. These slaves were not only employed in domestic service, but in mining, manufacture, and agriculture. Much of the commercial and clerical, and even the professional work was done by them, so that free labour found itself hemmed in on every side by servile labour. Slaves formed, in fact, the bulk of what may be called the working classes; and as slaves multiplied, manual labour naturally became despised by the free citizen. Two gigantic evils ensued. First, there was always danger of servile revolts; these when they broke out, as was often the case, had to be put down with relentless cruelty, especially in small states where the body of citizens formed a minority of the inhabitants. Second, class antagonism was engendered

within the civic circle. Finding very few openings for his energy, enterprise, or intelligence; forced into no intimate social relations with the rich by common industrial work; feeling the contrast between the real inequality of fortune and the nominal equality of political power,—the poorer citizen was filled with envy and hatred against the rich. He began to look to the state as a means of re-adjusting the distribution of wealth. Civil war became the order of the day. If the poor got the upper hand, then confiscation and banishment, if not massacre, followed; if the rich maintained their position, it was only by means of doles and bribes. The state was either paralysed by internal conflict or demoralised by corruption. A period of disturbance destroyed the delicate organism of the city polity; loss of civic independence and absorption into the Roman empire were welcomed as the only refuge from the weary round of revolution. The city-state lost its local sovereignty, and became an organ of imperial administration. Slavery, however, which was the curse of the city-states, was equally the curse of the Roman empire. It spread from the towns to the country. It had poisoned the life-blood of citizens by corrupting the artisan; it destroyed the nurseries of soldiers by supplanting the peasant.

[See *La Cité Antique*, by Fustel de Coulanges, Strasburg, 1864.—*History of Civilisation in Europe*, by Guizot (trans.), ch. ii.—*Aristotle's Politics*, by Newman, Oxford, 1887.—*Historical Essays*, by Freeman, 2d series.—*Public Economy of Athens*, by Böckh.—*History of Greece*, by Grote.—*History of Rome*, by Mommsen.] A. K. C.

CITY, MEDIEVAL. After the downfall of the Roman empire and the recolonisation of Europe by the various bands of invading tribes it was the cities planted or fostered by Rome that safeguarded the political heirloom of ancient civilisation. But when their inhabitants found breathing space to look round, they found the world completely changed. The centre of political power had drifted from the town to the country, and in the towns themselves the secular traditions of Rome, which had found support in civic aristocracies, resting on the sovereignty of Cæsar, were overshadowed by the spiritual influence of the Christian clergy looking more and more to the supremacy of the Pope. On the one hand the status of citizen with his urban dependents had given way before that of the chieftain with his rural retainers, and the citadel was being eclipsed by the castle; on the other hand the prestige of the curia and the magistrate was palling before that of the church and the bishop. In many a town through the dark ages the buckler of religion was the only weapon of defence against the arm of worldly power, and the altar the only asylum for the victims of oppression. But as the two great powers of the Middle Ages became organised

into feudalism and clericalism, municipalism was left to fight for itself. With the re-settlement of Europe and the revival of the demand for manufactures the cities naturally became the centres of industry and exchange. They found themselves, however, no longer independent states like the cities of ancient Greece and Italy, nor units of an imperial régime, but the fragments of an old system or the factors of a new, surrounded on all sides by a fierce military aristocracy looking with greedy eyes on their growing wealth. Increase of resources naturally inspired the townsfolk with the spirit of resistance, and about the 12th century there was a general movement among them for securing a distinct status in the mediæval world. Where the feudal régime was weak, and where municipal traditions were strong, as in the south of France, north Italy, and the eastern portion of Spain, or where natural conditions were favourable, as on the northern coast of Europe, on the Rhine, or on the Adriatic, there the townsfolk easily succeeded in winning quasi-sovereign powers, waging wars and making peace, forming alliances and embarking on conquests like the cities of old. But in the north of France, in England, Flanders, and Germany, where the feudal régime was strong, or where civic life was not deeply rooted in the soil, but was a plant of recent growth, there the cities, whether Roman or Teutonic in origin, had to engage in a tough struggle with their feudal lords, whether barons, bishops, or abbots, to secure some measure of self-government. Although fighting separately, they found a centre of support in the power of the rising monarchies of France and England and in the prestige of German imperialism, and by the tacit acquiescence or active assistance of their respective allies the communes of France, the towns of England, and the free imperial cities of Germany, won valuable privileges.

The revival of civic life in the cities of western Europe is therefore the common feature of the 11th and 12th centuries, but the development of that life varied greatly with surrounding conditions. The reception of a fierce feudal nobility into the bosom of the Italian republics, the commercial enterprise of the HANSEATIC LEAGUE (*q.v.*), coupled with the weakness of the central power in Germany, the natural advantages of the Flemish towns, the frequent appeals of the French communes for the intervention of the Crown, the closer touch of town and country in England, necessarily reacted on the civic politics of each country. But, in spite of the differentiation of structure by environment, certain features were general in most of the mediæval cities. They were based on work, not on war, and they flourished rather by commerce than by conquest. Whether, like most English, German, and Flemish cities, the mediæval city gradually grew out of the new rural colonisation;

whether, like the French, Italian, and Spanish towns, it was a revival of old urban life, still the mainspring of its existence was the demand of the country-folk for the industrial products of the townfolk. The shopkeeper and the merchant were in most cases the founders and restorers of civic life in the Middle Ages, and its humble origin explains the timidity that often characterised its action. Even when the cities rebelled against their feudal lords, they did so in self-defence, and were eager to purchase terms of peace. It was only the Italian cities with their feudal nobles that developed the haughty and aggressive spirit of the ancient republics, and made a business of bloodshed rather than of barter. The close of the period of conflict between the cities and their lords was in most cases marked by articles of peace called charters, and even in those parts of Europe, where no actual conflict broke out, the granting of charters became the fashion. Though differing in style and substance, these charters conferred much the same public liberties everywhere — exemption from arbitrary taxation, right to local jurisdiction, the privilege of enfranchising the villein who had been received for a year or a year and a half within the city's walls, and the power of electing officers and raising militia. To these public liberties private liberties were generally added, such as the right of citizens to marriage without the consent of their lord, the right of leaving their property to their children, and the like. But such privileges were not granted without fixed payments to the feudal lord on the part of the community in lieu of the uncertain exactions that had been previously levied in the shape of poll taxes and transit dues from individual traders. One important result followed from such fixed payments, namely, freedom of trade within the area belonging to the feudal lord, an area which gradually extended with the extension of the domain of the feudal over-lord or king. As the wealth of the cities increased under these favourable conditions, the fixed payments, which had taken the place of the old services and taxes, were supplemented by demands for extraordinary subsidies, and in settling these extra payments the cities came to be represented in the council of the nation, like the other feudal tenants, and an urban commonalty was eventually formed by the bond of common interests. When once the status of the city was more or less secure, its civic constitution underwent a change. The democratic equality of an age of confusion, based on individual strength and courage, gave way to the oligarchical inequality of a more settled state of society, based on wealth and intelligence. The meeting of all the inhabitants of the city to resist feudal aggression was superseded by the meeting of the chief owners of houses and shops to promote commercial enter-

prise. Trade being more and more the great interest of the city, the great merchants grew in prestige, and in their associations or guilds gained political power.

The origin of the civic GUILDS (*q.v.*) is to be sought in remote antiquity. The simple idea (see Stubbs) of a confraternity united for the discharge of common or mutual good offices, supported by contributions of money from each member, and celebrating its meetings by a periodical festival, may find parallels in any civilised nation at any age of the world. The ancient guild is simply the club or association of modern life. It was formed on the analogy of the family group, and was in many cases consecrated by religious ceremonies. The ends it subserved were very various—relief in poverty, sickness, old age, or in temporary difficulties, in loss of property, in making pilgrimages, dowry on marriage, repair of roads and bridges, and churches. The tendency to unite in frith guilds or clubs for mutual protection became general throughout Europe in the 9th and 10th centuries. In parts of the continent these guilds were roughly repressed, but in England and in the more independent towns of the continent they formed more and more the basis of urban life, and as trade and commerce became the chief interests of the towns, merchants and traders naturally formed their guilds or associations on the analogy of those already existing. As the maintenance of the privileges and immunities of towns became more and more a matter of money payment, the wealthy part of the commercial community that made itself responsible for this payment, and thereby protected the town and its trade from feudal encroachment, absorbed civic power. In many cases charters of incorporation were granted or confirmed to the chief guilds or guild. In fact these corporations were invested with an urban lordship, ranking side by side with the smaller rural lordships, exercising jurisdiction, enacting bye-laws, levying taxation, organising the militia, repairing the city walls, in short, carrying on all the functions of government within a limited area. The membership of a guild then became recognised as the passport to civic privileges, and so long as the membership in some guild was open to every inhabitant with a stake in the city, the constitution remained more or less democratic. But the enhancement of the commercial privileges secured by the cities made the merchant guilds more and more reluctant to admit new members. Below the merchant guilds, and outside the constitution, there were formed trade or craft guilds of the small manufacturers or artisans, weavers, shoemakers, carpenters, and the like. The greater folk of the large capitalists stood over against the lesser folk of the small capitalists, and as the numbers of the latter increased with the growth of manufactures, and the influx

of countrymen into the towns, a struggle for power ensued between the two classes of guilds, and in some of the continental cities, especially in the Rhine valley, took the form of civil war.

The result of this struggle was in many instances the enlargement of the civic constitution by the admission of the craft guilds, but these in turn became exclusive, and largely directed towards securing markets for their goods, while with the growth of capitalist manufacturers and the separation of masters and men in various industries, the artisan population of modern times began to grow up and form a fresh urban community. With the spread of the Reformation a strong tide of feeling set in against guilds in general, and we find in England a succession of laws passed in restraint of their authority. Although shorn of some of their powers and privileges, the merchant and trade guilds managed to survive in a less exclusive form, and proved valuable sources of revenue in times of emergency. Henry VIII., Elizabeth, the Stuarts, and Cromwell alike received money out of their coffers, and in return were content to leave them the real centres of civic power.

In spite, however, of the prevalence of the oligarchical form of civic government, the mediæval cities were the nurseries of modern freedom, of civil and religious rights. Within their walls there grew up the professional classes—lawyers, doctors, teachers, writers, and the like, who gradually formed the intellectual leaders of the commonalty. The separation of municipal and ecclesiastical authority in the persons of the magistrate and town council and the bishops and clergy, tended to create a liberty of thought and action such as had been unknown in the ancient world with its identification of church and state, and prepared the way for the Reformation movement. At the bottom of the social scale the influence of civic life was equally beneficial. Although the mass of the townsfolk were in a very degraded condition, yet they were freemen and not slaves, like the artisans of ancient Greece and Rome, or serfs, like the rural population outside the city walls. The town labourers, too, enjoyed some portion of civil liberty and knew how to combine against oppression, and, while struggling to raise themselves in the town, found a response from their brothers on the land. The barriers between the rich and the poor were regarded as fixed, not as in the past by a supposed law of nature, but by a contrivance of man. The church had from early times set its face against slavery; the city bred the spirit that eventually killed serfdom. While the growth of the capitalistic classes, the rise of the professional classes, and the increase of the wage-earning masses were gradually modifying the life of the cities from within, their external relations to the monarchical *régime* which was being consolidated in most parts of Europe during the 14th, 15th,

and 16th centuries, were slowly but surely modifying civic life from without. In France, Spain, Holland, and England, if not in Germany and Italy, the cities began to lose their local independence and quasi-sovereign powers, and to take their place in a more centralised system of national government. In Germany, owing to the weakness of the central authority, and in Italy, owing to the absence of any centre of national authority and the standing conflict between the adherents of the imperial and papal principle, the great Hanseatic cities and the republics of Lombardy, were able for a longer time to maintain their independence, but the outbreak of the Thirty Years' War in Germany and the invasion of Italy by Spain and France undermined their sovereign strength, and in those countries, too, the cities began to sigh for the strong hand of central control visible in western Europe. The signs of central control were to be seen in the limitation of local administration of justice, in the extension of national taxation, in the formation of a national army and navy, and, in some countries, in the nomination of civic magistrates by the central government. The ideas of self-government nurtured in the seedplots of cities were being transplanted to the national soil, and what the citizens lost in local privileges they regained in national rights. The conception of national free trade, national freedom of thought, national freedom of action, took the place of that of local liberties and immunities. In a country like France, with a strongly centralised government, and with an undeveloped system of national representation, the decay of local independence was too rapid for national well-being, but in England the spirit of local independence took full possession of the central government. With the growth of industry in the 17th and 18th centuries and the spread of democratic ideas that found their most emphatic expression in the French Revolution, the system of commercial monopolies and privileges was shaken to the centre. With the improvement of communications by road, river, and canal the demand for national free trade and the destruction of remaining barriers between town and country or districts and provinces became louder and louder, and with the fall of the old commercial system civic constitutions cried out for reform.

Ghent may supply an example of the mediæval city on a very large scale. Favoured by natural conditions, it was one of the earliest places of the north-west part of continental Europe to become the centre of trade and industry; and to develop the power of defending its growing wealth. Towards the close of the 12th century it purchased commercial and political privileges from its feudal lord, the Count of Flanders, and secured some increase of municipal self-government. Civic jurisdiction took the place of manorial, and

although at first, as in other cities, the local magistrates were appointed by the feudal lord, yet in time the power of election was granted to the citizens. A later charter gave the power of fortifying the city and of raising a militia. By the beginning of the 15th century the external circuit measured 9 miles, the city area was broken up into easily defensible districts by the arms of the river, the banks being connected by drawbridges, and at the sound of the famous bell Roland, 20,000 armed men prepared to fight for their liberties. The constitution of the city was originally democratic though controlled by the feudal authority above it, but, when municipal charters had conferred complete self-government, the power of the merchant guilds gradually transformed it into an oligarchy. In the 14th century the city was torn asunder by the internal factions of the merchant and craft guilds. The latter, especially those of the wool-weavers, had been established very early in Flanders owing to the wealth of the manufacturing industries and the necessity of defending them against the merchants, and it was only after a fierce and bloody struggle that political power was redistributed on a broader principle by the absorption of the merchants' guilds into the trade guilds. The final shape the constitution assumed in the 15th century was as follows:—The population was divided into fifty-two guilds of manufacturers and into thirty-two tribes of weavers, each fraternity electing annually or biennially its own deans and subordinate officers. The senate, which exercised functions legislative, judicial, and administrative, subject to the feudal court of appeal sitting at Mechlin and to the sovereign authority, consisted of twenty-six members. These were appointed partly from the upper class or the men who lived upon their means, partly from the manufacturers in general, and partly from the weavers. They were chosen by a college of eight electors who were appointed by the sovereign on nomination by the electors. The whole city in its collective capacity formed one of the four estates of the province of Flanders. The quarrels of Ghent with its liege lord generally arose from the demands of the latter for extraordinary subsidies to raise a mercenary force. If the subsidy was refused, war as often as not ensued, and though the burghers might be defeated on the open field, yet they were unassailable behind their walls against the armed force of feudalism. It was only when standing armies took the place of feudal militia and political passions divided the city, that Ghent had to submit to the loss of its liberties.

CITY, MODERN. The modern city is in some respects a revival of the ancient city of the Roman empire. It is a unit of administration in a larger state, and its powers and privileges are strictly dependent on the central authority, whatever be the nature of the latter. It differs from its prototype: *first*, because the principle of its government is democratic, not aristocratic; *second*, because the scope of its governmental authority is strictly defined by statute law, and not by custom or conquest. Residence or payment of rates in a certain area are the modern titles to urban citizenship; popular election or selection by an elected body is the general method of appointing the municipal administrator; bye-laws form the extreme limit of the city council's legislative power; and rates raised in a certain manner are the main sources of civic revenue. The time of residence, the amount of the rates, the method of election, the qualifications requisite for municipal honours, the extent of administrative functions and of the by-laws, the incidence and assessment of rates, may vary enormously in the different countries of Europe, in America, in the British colonies and Indian empire; but in all parts of the world of modern civilisation, with the exception perhaps of Russia, the above features characterise the modern city. Any man, and in the most advanced countries any woman, is at liberty, by taking a certain course of action which is open to all, to exercise the rights of citizenship in an urban community. He can be only prevented from exercising such rights by his own choice, fault, or misfortune. Physical, mental, or moral obstacles, that is to say personal impediments, may still exist, but there are no insurmountable barriers of law or custom.

The subordination of the modern city to a central authority shows itself chiefly in the sharper line which is drawn in modern times between local and national affairs, only those affairs being local which are by their very nature rooted in a clearly defined area. The mediæval city in the time of its strength had, as we have seen, within its boundaries almost complete self-government. It administered its own justice, largely based on customary precedents, it assessed its own rates and taxes, and handed over a lump sum to the central government, it preserved its own peace and order, and it raised

its own militia. The only sovereign power it did not possess after the rise of national government was the right of making peace and war. The modern city has almost entirely lost the right of local jurisdiction, it raises its own rates but has its taxes collected for it by national officials, it is in many cases responsible for its own peace and order, but it has no control over an armed force, and has to ask for its help if it requires it. On the other hand it exercises many local functions which in the Middle Ages were either left to the church or to private enterprise or to compulsory service, or were disregarded. Poor relief and education are now supplied or supervised by the chief civic body or by co-ordinate bodies. Sanitation is a matter of public concern not of private caprice, roads and bridges are constructed and repaired at the public expense not by means of private tolls, and lighting and water supply, in old times left to nature, are controlled if not provided by the municipality. The line drawn between local and national affairs varies in certain points in different countries, but, speaking generally, local affairs are those matters that touch on interests which are more immediately connected with the city's welfare, which the ordinary self-interest of the citizens is supposed to be capable of managing, and which do not admit of uniform regulation, *e.g.* roads, bridges, markets, harbours, lighting and watering; while national affairs are those in which the nation as a whole is more immediately concerned, which would not be provided for by civic self-interest, and which require uniformity of treatment. Such are civil and criminal justice, based on general principles of legal rights and penalties, national defence, postal communications, commercial regulations, and the provision of revenues required for effecting such purposes. Between the two fairly distinct classes of local and national affairs come those that are local in their application, and yet national in their interest—such as sanitation, police, poor relief, and education.

In the case of sanitation, the administration, though generally left in the hands of the city, tends more and more, with the spread of sanitary science, to be supervised by the central government. This at least is the principle on which local government in Great Britain is now conducted under various sanitary acts, and other countries are beginning to follow its example. In the case of police there is great diversity of practice in modern cities. From one point of view nothing is more distinctly a local affair than the preservation of peace and order within a given area, but from another point of view, namely, the grave danger to the nation as a whole of any local outbreak in a large centre of industry, it becomes a national affair. In all European countries as well as in America the police in the capital is under

national not municipal control, but in the provincial cities practice varies according as the more or less direction is left to the central government. But in no country is the city left responsible to its own citizens alone for the efficiency of its police force, and in some cases, as in France and Belgium, there is a national or state police acting side by side with the local police. In the administration of poor relief there is also much divergence of practice. Sometimes the local body that administers relief is a committee appointed by the municipal council—this is the case in Germany and in some American cities; sometimes it is the municipal council itself, as in France; sometimes it is a separate local body for the most part locally elected but supplemented by justices of the peace, as in England; but in all countries there is a tendency towards central control of local bodies in the matter of poor relief, and in this respect the local government board of England has led the way. Lastly, popular education is locally administered, but as a rule by bodies elected *ad hoc*, if not by a committee of the municipal council. The local body as a rule acts under state laws and sometimes by help of state subsidies, but it raises a local rate where schools are civic and not voluntary establishments.

But however much the scope of local affairs and the methods of administering them may vary in different countries, yet in all there is a large and on the whole an increasing amount of central control, financial and administrative. This control is exercised in England chiefly through the central departments, in America through the state, in France and Germany through the national executive, which has a voice in the appointment of the mayor and burgomaster, but in each case it is vital and vigilant. The local bodies are no longer independent organisms self-acting; they are the appendages of a larger organism. Local self-government has given way to local government.

Manchester may be taken as a typical example of the modern English city. Although a flourishing town in the Middle Ages, and possessed of certain limited rights of self-government exercised through the court-leet, yet it did not become a municipality proper until the passing of the Municipal Reform Bill of 1835; with a population of 505,343, 1891; it is now the fourth (if Salford is included, population 1891, 198,136, the second) largest town in Great Britain. Its municipal business is administered by a mayor and town council of 64 members, 48 being councillors elected by the ratepayers in 15 wards, and 16 aldermen co-opted by the councillors. The mayor is elected by the council for a year and is paid; the rest of the town council is unpaid. The council has to administer the various sanitary acts passed by parliament, to maintain

an efficient police force, to make and repair urban roads, to control building operations, and to work the Free Libraries Act, if adopted by the ratepayers. It has also, in virtue of special acts, undertaken to supply the town with water and gas. There is a separate body called the school board elected by popular vote to carry out the education acts, and another body called the guardians of the poor, composed partly of popular representatives elected by plural voting, and partly of local justices of the peace, to provide relief to the destitute. Justice is administered by officers of the crown, a stipendiary police magistrate, assisted by lay assessors who are justices of the peace (the mayor and ex-mayor being *ex officio* justices for petty crimes), a recorder for more important criminal cases, a county court judge for small civil suits, and finally the assize judges as the highest criminal and civil court.

The town council's legislative power only extends to that of passing by-laws; the reasonableness of by-laws can be disputed in a court of law, and they are not binding like acts of parliament. The corporation and town council can sue and be sued like an individual. It must meet four times a year at least, it must appoint a finance and police committee, it must send in its accounts to the local government board, it cannot borrow money except with the consent of the local government board or some other central department, and it cannot raise money except in certain specified ways, chiefly by a rate on occupied houses, and for certain specified purposes. If it wants to have its powers in any way enlarged it must apply to parliament, whose creature it is.

See COMPANIES, CITY OF LONDON.

CIVIL LAW, in the widest sense of the term, denotes the law of the state, as distinguished from the law Christian or CANON LAW (*q.v.*) In a narrower sense the term is used to denote the Roman law, the great storehouse of rules and principles from which the institutions of modern states have been in great part derived. The history of Roman law begins with the unwritten customary rules observed by the *gentes* and *curiae* which made up the ancient city-state, and with the *leges* or written laws in which the sovereign people declared its will. When the plebeians made good their claim to political rights, the most important rules of the early law were roughly codified in the Twelve Tables (450 B.C.), and in process of time new laws came to be made by the assembly of the plebeian

tribes; a *plebiscitum* had the authority of a *lex*. As the trade of the city increased, it was found necessary to supplement the old civil law by rules of a less formal and more rational character, such as might be applied to traders and others who were not Romans; these rules formed the so called law of nations, *i.e.* the law administered by Roman magistrates to men of all civilised nations. This wider law was afterwards identified with the law of nature, a conception borrowed from Greek philosophy. Nature implants in man the instincts which lead him to form societies and states, and nature endows man with reason, the power which enables him to improve legal rules, and to administer the law in a spirit of equity. With these philosophic notions the Romans combined great practical skill; their forms of conveyancing, their system of accounts, and the procedure of their courts have exercised and still continue to exercise an important influence on all the commercial transactions of the modern world. The success of their imperial policy gave them a wide field for legislation and administration; but empire brought with it a change in the character of the civil law. The public law of the ancient city was subverted in the interest of a centralised despotism; the private law, *i.e.* the law relating to property, contracts, family relations, etc., was greatly developed and improved; the emperors began by using the senate as their instrument of legislation; then they dispensed with formalities and assumed the right to make constitutions or new laws by their own authority. In applying the Roman law throughout the provinces, magistrates were much embarrassed by the number and complexity of legal rules and textbooks. Several attempts were made to codify the whole law; and Justinian finally gave his sanction to a code of imperial constitutions, a digest of the works of the best jurists, and a book called the *Institutes*, which was to form the basis of legal education. These three works form the Corpus Juris, the authoritative exposition of the civil law.

In the history of Roman law we may study the origin of those commercial conceptions of property and contract which modern economists make the basis of their science. According to the old customary law, property belonged to family groups; the *paterfamilias* had no very extensive rights of alienation; things necessary to the family existence, such as land and slaves, were alienated with the cumbrous form called mancipation, other things only with the forms of a fictitious lawsuit. By the later law, the *dominus* or owner had extensive and well-defined rights of use and abuse; he could alienate *inter vivos*, and, within certain limits, by will, at his own discretion. The full rights of *dominium* were conceded to persons not recognised as owners by the formal customary

law ; possession of land allotted by the state came to be equivalent to ownership ; and equitable ownership came to be as safe, under the protection of the prætor, as the *dominium* of the Quiritarian or ancient Roman law. A thing which could legally be owned was said to be *in commercio*, a thing to be disposed of ; such things were corporeal or tangible (land, goods, money, etc.) or incorporeal (debts and valuable rights). Immovable things (land and house property) are distinguished from movable things (goods, etc.) It is to be observed that the Roman law does not attach any special importance to property in land ; the *dominus* of land came to have very much the same freedom of alienation as the owner of goods ; a person not the owner of land acquired rights over it only by virtue of some definite contract or transfer of property rights on the part of the owner. The complication and difficulty of property law arise from the various arrangements by which the rights constituting full ownership may be separated from one another and vested in different persons. The custody and use of a thing which belongs to A may be transferred by agreement to B ; A may be restricted in the use and alienation of his property by reason of rights vested in B : in other words, B may enjoy a servitude over the property of A. B may have a right-of-way over the land of A, a right to use the land for his own convenience, and this we may call a positive servitude. Or he may have a right to forbid the erection of a building on A's land which would obstruct the passage of light to a neighbouring house, and this we may call a negative servitude. Rights of way and rights to light are prædial servitudes ; they cannot be claimed unless by the owners or occupiers of neighbouring property. There are also personal servitudes, rights over the property of another enjoyed by an individual without regard to his ownership or occupation of property. Of these the most important is usufruct, the right to use and take the fruits or profits of property belonging to another. Where money and goods are treated as capital, one person may have the usufruct or quasi-usufruct, the capital stock being preserved intact for the persons interested in the corpus.

The law of contract exhibits the same gradual extension of individual liberty as we observe in the law of property. Primitive custom hardly permits a person to alter his rights by his own act, or by private agreement with another. But in time reasons are found for enforcing certain kinds of agreement. These are (*a*) *real* contracts, *i.e.* those which are concluded by transfer of a thing. If *e.g.* a person actually receives a thing by way of loan or deposit, he is compelled to restore the thing or its equivalent. Barter is a real contract ; it becomes binding when one party has actually performed his part of the bargain, *do ut des*. In the case of (*b*) *formal*

contracts, where the agreement is binding because the parties have used some solemn form ; they have exchanged the words of question and answer known as a stipulation (verbal obligation), or they have joined in making an entry of the debt in the creditor's ledger (literal obligation). Further, the law recognises *consensual* contracts, which owe their binding force to the agreement of the parties. In an action on a formal contract, claim and defence must be founded on the strict letter of the law ; in an action on a consensual contract, plaintiff and defendant might be ordered to do what was fair and right. To the class of consensual contracts belong the most important commercial transactions—sale, letting and hiring, partnership, and mandate. Such were the lines on which the Roman lawyers constructed their system of proprietary and contractual rights. To give effect to the rights recognised by law is the office of courts and magistrates. At Rome and elsewhere the reign of force precedes the reign of law ; self-redress is the rule of all early communities ; it is only by degrees that the state assumes authority to decide private disputes. First we have customary rules by which money payments might be made in atonement for wrongful acts ; there are also customs and forms by which private transactions are placed under public protection—a sale, a will, or a contract is made in presence of the people, or of witnesses representing the people, and the community is thus bound to see that the parties perform their duty. Finally, disputes when they arise are referred to arbitration, and forms of process are prescribed by the magistrates. Of the forms of action known to the oldest Roman law, one was a request that the magistrate would appoint an arbitrator ; another took the form of a solemn wager, each party depositing a stake which was forfeited if he failed to prove his case. On the analogy of this action by wager was framed the *condictio*, a remedy which seems to have been introduced in the interest of creditors and the money-lending class. There were also forms of execution, by which a creditor could seize his debtor's property and hold it as a pledge, or lay hands on the debtor himself and bring him before the prætor. If the debtor did not discharge or formally contest his liability, the creditor might take him away and detain him in custody ; after the lapse of a prescribed time the debtor might be sold into slavery or put to death. These early forms of process were superseded by an improved system, under which cases were sent by a magistrate to a private arbitrator, each case being reduced to a *formula*, in which the issue to be tried was exactly set forth. Cases not suited for arbitration were tried by the magistrate himself ; by the imperial legislation arbitrators were almost altogether dispensed with, and all questions of law and fact were decided by the judges.

When the Roman empire was broken up, the nations of Europe framed for themselves those laws which are generally described as the feudal system. Feudalism, as Sir H. Maine points out, combines the surviving forms of Roman law with the customs of the barbaric tribes which overran the empire, and with the Christian sentiment which bound men together by the tie of mutual service. The object of the whole system was to fix the social order by defining each man's duties, and by connecting these duties as far as possible with the tenure of land. The defects of the system were that it left too little room for individual enterprise, and that, by making each man look only to his immediate superior, it strengthened small local powers at the expense of national governments. With the revival of learning and the Reformation there came a demand for greater liberty, and about the same time the renewed study of Roman law directly and powerfully influenced the laws of continental nations; but the feudal customs held their ground until, in the 18th century, political writers began to speculate on the possibility of framing laws of a more simple and rational character, based on general notions of justice and humanity. It was almost taken for granted that social inequalities and abuses were due to bad laws; philosophers drew up ideal codes, and sovereigns, like Frederick the Great, Joseph II., and Catherine of Russia, busied themselves with large schemes of legislation. In France, the Revolution swept away old institutions; the Convention began, and Napoleon carried through the work of providing the people with a new system of laws. There are, of course, infinite differences of detail in the laws of modern states, but in all of them we find the distinctions, classifications, and expedients of the Roman law, adapted to the existing condition of society. It is, therefore, not surprising that socialist writers should endeavour to break down the rigid legal ideas which the modern world has derived from the *Corpus Juris*. To the socialist, property does not seem to fall into the domain of private rights; he regards it as forming part of a common social stock; he will not permit contracts to be rigidly enforced, for to him a contract is only an arrangement between individuals, to be revised or set aside if the general interest seems to require it.

The history of our own law possesses a peculiar importance. Though deeply indebted to the Roman jurists, English lawyers never accepted the *Corpus Juris* as an authoritative text-book; they worked out a system of their own on the basis of the common law, *i.e.* of the custom common to the whole kingdom. English customary law was never codified, in whole or in part; it was handed down in the form of an unwritten tradition, of which the freemen themselves, assembled in their local

courts, were the interpreters and the guardians. When the king's judges began to go circuit, administering justice in every part of the country, their decisions were accepted as the most complete expression of the common law. In applying legal rules to land, the judges began by expounding the feudal tenures with a subtlety which savours of the logic of the schoolmen; but their bias was in favour of free alienation; they invented or permitted devices by which entails were barred, and settlements brought within strict limits. The tendency towards freedom of disposition was also apparent even in our early legislation, and the chancellor, in the exercise of his equitable jurisdiction, did much to enlarge the power of an owner to deal with land in the way of commerce. Feudal restraints have now been almost entirely removed; the modern law gives to an owner in fee simple all the rights enjoyed by the *dominus* of Roman law. But the transfer of land is beset with difficulties; legislation has removed many of the subtleties of the old law, but the statute-law is so voluminous and complicated that conveyancing is still an art revered by practitioners and little understood by the general public. The acts passed in England and Ireland for the benefit of tenants and labourers, represent the result of efforts to combine some of the ideas of social democracy with the rigid notions of individual ownership which commended themselves to the judgment of legal experts. Of those who are most active in promoting changes in the land laws, some would be content with "free trade in land"; others again would nationalise or municipalise the land, with a view to having it managed for the general good, on principles inconsistent with individual ownership and freedom of disposition. Political discussion is much embarrassed by the obscurity of the subject; the economist or the legislator who resorts to legal treatises for information is bewildered and sometimes misled by the technical character of the language employed.

English law has always professed to favour trade; but the trade of old time was carried on under the narrow regulations which were rendered necessary by the privileges of corporations and companies. Even in the 18th century mercantile law was almost undeveloped; in the early editions of Blackstone's *Commentaries* only a few pages here and there are given to the subject. Lord Mansfield was then beginning the long series of his decisions, applying the principles which he derived from his study of Roman and English law to the business of a great and rapidly advancing commercial nation. Since his time, every species of contract and security has been made the subject of prolonged and repeated legal discussion; it would almost be possible to write a history of English commerce from the law

reports alone. Freedom of contract has been the avowed policy of the courts; the law leaves men free to dispose of their property and services at their own discretion, and compels them to carry out the bargains which they choose to make. But all private bargains are controlled by public policy; the law will not permit, for example, a wager to be made in the guise of a contract of insurance; and agents have often been forbidden to plead mercantile usages which would enable them to make profit of their agency without the knowledge of their principals. The policy of the common law would not permit partners in a concern to limit their liability; but this principle has been departed from in modern legislation relating to joint stock companies. In studying these and other topics belonging to mercantile law, we perceive that rules of law are not the arbitrary invention of legislators or judges; they arise naturally out of the usages and transactions of ordinary life. Some difficult problems are suggested to the jurist by the conditions of modern commerce. Free trade and open competition lower the standard of profit, and capitalists form trusts and syndicates with a view to obtaining the control of great markets: is it necessary or desirable that the law should limit their freedom of action? Trade unions claim to dictate terms to employers and labourers: where shall we draw the line between lawful and unlawful combination? These are legal questions, but they are not to be solved by the application of any legal formula: the law merely gives an authoritative form to the notions of justice and expediency which prevail in the community at large.

[The history of law may be studied in *Ancient Law* and other works of Sir H. Maine; for the legal analysis of the ideas of property, contract, etc., see Holland's *Jurisprudence*, and works of Austin and others there cited. Roman law is set forth in the *Corpus Juris Civilis* and in the numerous commentaries thereon; a compendious view is given in Colquhoun's *Summary of the Civil Law*. For the laws of modern European nations, reference may be made to Roger et Sorel, *Codes et Lois Usuelles*.—Stobbe, *Handbuch des Deutschen Privatrechts*, etc. English law is expounded in Blackstone's *Commentaries*,—Smith's *Mercantile Law*; for the rules relating to bills of exchange, sale of goods, and bankruptcy, the works of Judge Chalmers may be consulted with advantage. The Anglo-Indian Codes (edited by Mr. Whitley Stokes) contains a compendious statement of the chief rules of English law relating to contracts, etc.; these rules apply to the natives of India if, and in so far as, their occupations bring them within the circle of British civilisation. A native merchant at Calcutta frames his contracts according to British law, while the peasant cultivator's rights are determined by the custom of his village. Lord Mansfield's most famous judgments may be found in Smith's *Leading Cases*; see especially *Carter v. Boehm* (insurance), and *Miller v. Race* (property in bank-notes), and observe the

use made by an English judge of the maxims of the civil law. Lassalle's *System der Erworbenen Rechte* is an interesting study of Roman law by a jurist who became one of the leaders of socialism.] T. R.

CIVIL LIST. The arrangement by which an amount was set apart under this head for the ordinary service of the establishments of the royal household and other expenses of the crown dates from the Restoration (1660). The hereditary revenues arising from the crown lands, and certain minor taxes, were appropriated for this purpose, the amount being about £680,000 a year (temp. Will. III.) From this the incomes of the lord chancellor, the judges, ambassadors at foreign courts were defrayed, together with the pensions granted by the monarch as well as his personal expenses. This arrangement, which was open to many abuses, lasted to the end of the reign of Geo. IV. When William IV. ascended the throne, a select committee of the House of Commons was appointed to inquire into the matter, and resolved that it was expedient that the civil list should be applied only to such expenses as affect the dignity and state of the crown and the proper maintenance of the royal household, and that many expenses which up to that date had been included in it, and had no immediate connection with these objects—which were really part of the expenses of the civil government of the state, ought to be removed from the civil list and placed under the cognisance and constant control of parliament. These charges were therefore transferred to the CONSOLIDATED FUND (*q.v.*) and the civil list established mainly on its present footing; some pensions, however, were included in it.

According to Parliamentary Paper 22, Session 1837,—being the report from the select committee of the House of Commons, appointed to inquire into the accounts of income and expenditure of the civil list, from 1st January 1831 to 31st December 1836; with an estimate of the probable future charge of the civil list of Her Majesty,—the civil list of Will. IV. was apportioned for the following purposes:

1st Class	Privy Purse . . .	£110,000
2d Class	Salaries of the several Departments of the Royal Household, and Superannuation and Retired Allow- ances . . .	130,300
3d Class	Tradesmen's Bills . . .	171,500
4th Class	Royal Bounty, Special and Secret Service . . .	23,200
5th Class	Pensions . . .	75,000
		£510,000

The report proceeds to state that, in considering an estimate for the future civil list of the sovereign, the committee had been guided,

to a considerable extent, by the expenditure during the late reign. The payments proposed were divided under five heads described as below.

Class I

The privy purse of the sovereign has been for upwards of half a century (now more than a century), fixed at £60,000. During the late reign (Will. IV.), there being a queen consort, a further sum of £50,000 was allotted to this class. Under existing circumstances, your committee recommend that an annual sum of £60,000 be provided for this branch of the royal expenditure.

Class II

The second class comprehends the salaries of the great officers of state, those of the officers and menial servants of the royal household, and the superannuation and retired allowances payable to persons of the latter class. The committee, concurring in the opinion expressed in the report of 1831, "that it was not consistent with the respect due to her Majesty to scrutinise the details of her domestic household," have not undertaken any minute investigation into that branch of the subject; but they have received, as already stated, a very full analysis of the whole of this branch of expenditure.

The principal officers of state in attendance on the sovereign were the lord steward, lord chamberlain, master of the horse, and groom of the stole. It was not proposed to fill up the office of groom of the stole, or to create any analogous office in the household of Her Majesty. It was also proposed to reduce the number of lords-in-waiting from twelve to eight, and of grooms-in-waiting to eight from thirteen. The consolidation, when a vacancy should arise, of certain other offices was recommended. In considering the amount to be recommended for this class, your committee feel it their duty to call the attention of the house to the fact that no application is now made to parliament for the grant of pensions for the servants of the late king. With these explanations, your committee recommend the estimate of £131,260 for the second class of the civil list.

Class III

Considering the disbursements which have taken place in the late reign under the head of bills of tradesmen, your committee recommend the proposed estimate of £172,500 for this branch of the royal expenditure.

Class IV

The fourth class of the civil list of his late Majesty included the following heads:—

Royal Bounty	£9,000
Home Secret Service	10,000
Alms and Charity	4,200
	<hr/>
	£23,200

After much consideration, your committee

have determined to recommend that the sum of £10,000, now charged on the civil list for secret service, may be transferred to the consolidated fund by act of parliament, to be applied to the same purposes, and under the same authority, as heretofore.

The provision for this class will consequently be reduced, as a charge on the civil list, to £13,200.

Class V

The committee approached the consideration of the pensions charged on the fifth class of the civil list with a full sense of the attention which the subject has exacted. Your committee refer to the following passage in the report of 1831:—"The house must recollect, that the principle on which the sum is allotted by parliament for the purpose of the civil list is as a payment for the personal advantage of the sovereign, and for the support of the dignity of the crown, in lieu of the hereditary revenue which at the commencement of each reign the sovereign sacrifices for the benefit of the public: some provision ought in all cases to be made for such payments, as it might be presumed the sovereign would have been desirous of making had he remained in possession of the hereditary revenue. That one class of such payments would be pensions to those of his subjects whom he wished to favour cannot be doubted." In conformity with this opinion, your committee recommend that the provision for the grant of pensions should continue to form a part of the civil list of Her Majesty.

But in order to guard against the supposition that an enactment founded on this principle should in any degree interfere with the inquiry into pensions, of which notice has been given in the House of Commons (if it appears fitting that such inquiry should be instituted), it is the opinion of your committee that, in place of granting a sum of £75,000 for civil list pensions, Her Majesty should be empowered to grant in every year new pensions on the civil list to the amount of £1200; these pensions to be granted in strict conformity with the following resolution of the House of Commons, passed on the 18th of February 1834:

"That it is the bounden duty of the responsible advisers of the crown to recommend to His Majesty for grants of pensions on the civil list, such persons only as have just claims on the royal beneficence, or who, by their personal services to the crown, by the performance of duties to the public, or by their useful discoveries in science, and attainments in literature and the arts, have merited the gracious consideration of their sovereign, and the gratitude of their country."

Your committee recommend that this resolution should be engrafted in the Civil List Act, and that annual returns of the pensions granted, and the names of the several parties,

should be laid before parliament. The civil list of Queen Victoria was fixed accordingly at the following amount:

Class I	Privy Purse	£60,000
Class II	Retired Allowances, Salaries, and Wages	131,260
Class III	Expenses of Household	172,500
Class IV	Royal Bounty, Alms, and Special Services	13,200
Class V	Pensions (Her Majesty to be empowered to grant pensions in every year to the extent of £1200 per annum)	8,040
Unappropriated Monies		385,000

This arrangement continued unaltered till 1889, when it was desired that a provision should be made for the support of the Queen's grandson Prince Albert Victor, and her granddaughter Princess Louise Victoria, on the occasion of her marriage with the Earl of Fife. An act was therefore passed (Prince of Wales Children's Act, 1889) the following clauses of which explain its object. (1) "It shall be lawful for Her Majesty the Queen, by letters patent under the Great Seal of the United Kingdom, to grant to the Prince of Wales's trustees, hereinafter mentioned, the annual sum of £36,000, which shall determine on the expiration of six months after the death of Her Majesty." (2) "The persons who are for the time being the first commissioner of Her Majesty's treasury, the chancellor of the exchequer, and the comptroller of the household and treasurer of His Royal Highness the Prince of Wales shall be the Prince of Wales's trustees, and shall be a body corporate by that name, and any act of the trustees may be signified under the hands and seals of the persons who are the trustees for the time being."

CIVILISATION. Ricardo pointed out (*Principles*, ch. v.) that the natural price of labour varies greatly, and "essentially depends on the habits and customs of the people." The closer political and industrial communication established between civilised, half-civilised, and uncivilised peoples since Ricardo's time has confirmed the truth of this observation and shown the difficulty of applying many economic maxims universally when local conditions vary greatly. The industrial life of each people harmonises with its environment of political structure, customary morality, and current intelligence. Any observed type of industrial organism is greatly determined by the conditions of civilisation existing there and then, both in regard to the wealth of the community as a whole and the economic relationships between its parts. The family, in its various forms, is the one constant social element, and offers the best

basis for economic observations (F. Le Play, *Les Ouvriers Européens*, I.)

1. It is at first sight natural to ascribe the poverty of any tribe to the physical conditions under which they live, such as the barrenness of the soil, or the rigour of the climate. Such hindrances set definite limits to progress at any given time, but every increase in intelligence or social improvement removes them farther back; they form a relative, not an absolute check to the increase of prosperity. The success of the Dutch in forming a rich community despite disadvantages of every kind, shows how skill and energy may overcome nature and overpass limits that would otherwise prove insuperable barriers. The example of Sweden may likewise be cited. The use to which the wealth of a people is put depends on the current view of utility or enjoyment; it may be spent in warfare, embellishment, or extravagance; it may be devoted to improving the country and the condition of the people. Unless some portion is carefully devoted to these latter purposes, a civilisation will be short-lived, however brilliant it may be. The rapid decline of some Eastern empires and of the glories of Athens may be thus explained; the Romans, on the other hand, devoted much energy to developing the resources of their empire, and gave it more stability.

2. Though the chief economic activity of societies of men has always had the same object of securing sustenance, clothing, and shelter, they have been, and are, grouped for these purposes in different ways. We may distinguish four types: (i) In the early village community (*Maine's Village Community*, Laveleye, *Primitive Property*, see AGRICULTURAL COMMUNITY) the work is undertaken collectively, and wealth forms a common fund. Unwritten custom, administered by patriarchal or elected authority is supreme; and individual energy is devoted to the common good of a small self-dependent group. (ii) In municipal societies, like the mediæval cities, the inhabitants are organised according to their callings in separate guilds; the status in life of each inhabitant, generally speaking, is determined by the standing of the guild, on the regulations of which the conditions for labour and rate of pay depend. The individual cannot rise out of his sphere in life, and to hold a good position in his own guild is the chief object of ambition (see GUILD). (iii) By national organisation the central government may direct the economic energies of a whole nation, so that each village and each town shall contribute as much as possible to the maintenance of national power. Colbert may be specified in this connection, and the various economic systems which were criticised so effectively by Adam Smith (*Wealth of Nations*, iv., see COMMERCIAL SYSTEM). (iv) In modern society each individual is left free, so far as possible, to pursue his own greatest ad-

vantage, and, for this purpose, employs his labour or his capital in any direction which seems likely to be profitable, without being hampered by family ties and local regulations; or he unites in voluntary associations where it appears that he can reap a greater measure of personal advantage (see CO-OPERATION; COMPANIES).

It may be noticed in regard to the distinct types of economic organisation found under different civilisations, that the higher forms are extended over very large areas and give much free play for individual energy. Working on a large scale, while they are very complicated in their details, they are far more effective for the purposes of providing food, clothing, and shelter than the simpler machinery found in less developed societies. Again, the history of any one great civilisation shows how the industrial organisations of the simpler type have been in turn displaced by more effective institutions; though fragments of the old may remain, cramped probably by regulations that have become unwise since they are out of date. Hence we may find in an old society some arrangements which appear to be wholly at variance with modern modes of thought, which only become intelligible when understood to be survivals of institutions once really important, though now mere anachronisms. While much interest attaches to the study and working of any economic system, the higher civilisations with their more effective arrangements for organisation offer the best field for investigating the causes which affect the growth and maintenance of national wealth.

W. C.

CLARKSON, THOMAS (born 1760, died 1846), a leader in the crusade against the slave-trade, the evils of which he first realised when competing at Cambridge, 1785, for a prize to be given for the best essay on the subject *Anne licet incitos in servitutem dare*. Clarkson won the prize, and published his essay, translated and enlarged, 1786 (2d ed. 1788). In a subsequent essay *On the impolicy of the African slave trade*, 1788, he argued that the traffic which he had proved to be iniquitous was also unprofitable. Among many publications on the same subject may be noticed *History of . . . the Abolition of the African Slave Trade . . .*, 1808. In a new edition of this work, 1829, there is a preface describing Clarkson's later labours in the cause of the slave. To the second series of his philanthropic efforts belong *Thoughts on the Necessity of Improving the Condition of the Slaves in the British Colonies with a View to their Ultimate Emancipation . . .*, 1823; and *The cries of Africa to the Inhabitants of Europe . . .* (?1822). Clarkson also wrote, *Not a labourer wanted for Jamaica*, to which is added an account of the newly erected villages by the peasantry and their beneficial results, 1842; and *The Grievances of our Mercantile Sea-*

men a National and Crying Evil, 1845 (see ABOLITIONIST).

[*Biographical Sketch of Thomas Clarkson*, by Thomas Taylor, 1839.—*Sketch of the Life of Thomas Clarkson*, 1876.—Clarkson, William, author of *An Inquiry into the Cause of the Increase of Pauperism and Poor Rates, with a remedy for the same and a Proposition for Equalizing the Rates throughout England and Wales* (1815)].

F. Y. E.

CLASSICAL ECONOMISTS. This name has been applied to Adam Smith and his immediate successors, Malthus, Ricardo, James Mill, M'Culloch, and Senior, and, less often, to the French physiocrats.

In keeping with the Latin derivation of "classical," and with the use of the term "classical authors," the name might simply denote economic writers of the first rank who have left models which all others must follow. A less complimentary interpretation is given by Professor Brentano, who compares classical economics to classical sculpture, where, he says, personal peculiarities are ignored in favour of broad general human characteristics, and of an "abstract man" without scars or wrinkles. Economists, he says, belong to the classical school when they reason deductively from the assumption of an "abstract (economic) man." The justice of this description need not be discussed here. See DEDUCTIVE METHOD; HISTORICAL SCHOOL; M'CULLOCH; MALTHUS; MILL, JAMES; PHYSIOCRATS; RICARDO.

J. B.

CLASSIFICATION is described by Mill (*Logic*, vol. ii. p. 258, 4th ed., bk. iv. c. vii.) as "a contrivance for the best possible ordering of the ideas of objects in our minds; for causing the ideas to accompany or succeed one another in such a way as shall give us the greatest command over our knowledge already acquired, and lead most directly to the acquisition of more." From this description we may conclude that classification is more than a matter of neatness or convenience. We can classify things correctly only in so far as we can see them in their true relations, and to see them in their true relations is nothing less than to know their true nature. "The value of classification," says Jevons (*Principles of Science*, vol. ii. p. 345), "is co-extensive with the value of science and general reasoning." Or, as the same writer puts it elsewhere, "Science can extend only so far as the power of accurate classification extends," p. 421. It is not, therefore, surprising

that the theory of classification should have been discussed at length by the most eminent writers upon scientific method, or that success in classification should be one of the distinguishing marks of scientific genius.

Classifications have frequently been distinguished as natural and artificial, or as they might better be termed, scientific and arbitrary. In artificial classifications "some characters arbitrarily chosen serve to determine the place of each object; we abstract all other characters, and the objects are thus found to be brought near to or to be separated from each other often in the most bizarre manner. In natural systems of classification, on the contrary, we employ concurrently all the characters essential to the objects with which we are occupied, discussing the importance of each of them; and the results of this labour are not adopted unless the objects which present the closest analogy are brought most near together" (Ampère quoted by Jevons, *Principles of Science*, vol. ii. p. 351). Or, as Mill puts it in his *Logic* (bk. i. ch. vii., vol. i. p. 137 *et seq.*), some objects are separated from each other by differences of kind, that is to say, by an indefinite and inexhaustible number of particular differences; other classes of objects are separated only by certain specific differences which are not indices of any others.

But too much must not be made of these distinctions. The difference between an artificial and a natural classification is only one of degree. Any classification, however subordinate the differences upon which it is based, tells us something about the nature of the objects classified. The classification which is useless for the purposes of one science may be all-important for the purposes of another science. Thus crystals will be classified by the chemist with reference to their chemical composition, and by the crystallographer with reference to their peculiar crystalline form, and the two classifications will be altogether discrepant with each other. Again, the progress of knowledge has shown that hardly any distinctions of kind are absolute, that indefinite variation, not orderly grouping, is the way of nature, and that scientific precision is to be found not in drawing distinctions between classes, but in tracing the laws of development. Even before the idea of evolution had attained to its present distinctness, it was remarked that in the sciences known *par excellence* as classificatory, the sciences of botany and zoology, classification was based not on definition but on types. In other words it was found that the individual forms of animal or vegetable life clustered themselves around certain types to which few if any conformed with exactness, whilst all were closely akin. But since a type in this sense is but the compendious symbol of a number of nearly related classes, it is clear that a classifica-

tion by types is either an inaccurate classification or else a classification which has not been fully carried out.

In the moral and political sciences, including political economy, classification is beset with peculiar difficulties and dangers. The most obvious of these lies in the fact that none of these sciences possesses, or is ever likely to possess, a complete scientific vocabulary, the terms of which have the same precise sense for every student, whilst they remain undefaced by loose popular use. Classification is at every step dependent upon nomenclature; and it is only in sciences which, like botany, possess a complete and precise technical nomenclature that classification can be carried out to the utmost extent. But a more serious hindrance to classification is to be found in the nature of the subject-matter of moral and political science. Their subject-matter is far more complex than the subject-matter of botany or zoology. If it be true that practically every individual in the vegetable or animal kingdom embodies a more or less considerable variation from a type, how much more is this true of every human being and of every human institution. Anybody who compares with the classifications of natural science the classifications, say, of feelings or motives in a treatise of psychology, will feel how much less adequate is the latter to the object aimed at by the writer. And in the study of society Mr. Herbert Spencer's *Descriptive Sociology* affords a striking example of the difficulties which beset classification and of the limited advantages to be derived from it. When we look closely into ideas or institutions which at first sight appear very similar, we usually find differences of a momentous nature. This may be exemplified by the well-known hazard in predicting from some instance in the past the working of a new institution which seems to resemble it. It may almost be said that in the sphere of moral and social science the only true kinds are individuals. The most sagacious and suggestive writers upon these topics have shunned elaborate classification as they have shunned the use of highly technical language.

Spencer, *Classification of the Sciences*.—P. Geddes, *Classification of the Sciences*.] F. C. M.

CLAY, HENRY, born in Virginia 2d April 1777. After receiving but a poor and elementary education; he became a lawyer and removed to Kentucky, where he entered on a political career of national importance, and three times in his life—in 1824, 1832, and 1844—was a candidate for

he presidency. Although not an author, Clay is noteworthy in economics as intimately associated with the development of the so-called "American system" in the United States, or the policy of protection to manufactures by means of tariff duties, and the liberal encouragement of internal improvements under national authority. In 1806, he became a member of the U.S. Senate, and for nearly forty years, with the exception of brief periods, was a member of this body or of the House of Representatives. His most important speeches bearing upon the subjects of protection and internal improvements are the following: *Manufactures*, 6th April 1810; *Internal Improvements*, 13th March 1818; *Protection to Home Industries*, 26th April 1820; *Internal Improvements*, 16th Jan. 1824; *American Industry*, 30th and 31st March 1824; *Influence of the American System*, 2d, 3d, and 6th Feb. 1832; *Introducing the Compromise Bill*, 12th Feb. 1833; *Support of the Compromise Act*, 25th Feb. 1833; and *On the Tariff*, 1st March 1842. In favour of protection he argued that it was necessary to establish a home market for agriculture, as American power of production was increasing in a ratio four times greater than foreign powers of consumption; that the United States should not permit itself to be a commercial slave; that a well-established system of manufactures promoted political peace with foreign countries; that manufactures would bind the various interests of the country into a closer union. Clay repeatedly insisted in 1820, 1824, and 1832, that the question of protection must be decided in face of the fact that European nations maintained similar systems. "I, too, am a friend to free trade," he said in 1820, "but it must be a free trade of perfect reciprocity." It will be noticed that the arguments referred to are mostly of a political nature; by 1832, Clay advanced more prominently reasons of a more strictly economic character; and then argued that through the tariff of 1824, the commodities which had been protected were cheaper, and that products of agriculture commanded a higher price owing to the creation of a home market. Little was said about the mercantile theory of balance of trade. The advocacy of internal improvements undertaken by the national government in the first third of this century, was due to reasons which would not be appreciated at the present time. Settlements west of the seaboard were scattered, and it was difficult, and in many cases perilous to reach the advance guard of western emigrants. Improvements were urged not only on political but on economic grounds. The agricultural products of Ohio were of little value as long as the only commercial outlet was the Mississippi, reached by the Ohio river. Even Jefferson, who in general with the Republican party favoured the strict construc-

tion of the powers of the constitution, yielded to the general demand that the national government should actively assist in building roads and canals and improving rivers. In judging then the position of many public men of the United States at this time in regard to a wide interference of the state in industrial affairs, one must bear in mind the political exigencies due to the fact that it was impossible to secure from the several states harmonious and wise action, necessary for an inter-state route. Clay was one of the founders of the Whig party, and in general acted in harmony with it on political questions. For his speeches on the United States Bank, see the following: *A National Bank*, 1811; *The Bank Charter*, 3d June 1816 (delivered at Lexington, Kentucky); *Veto of the Bank*, 12th June 1832; and for his speeches on the sub-treasury system in which he urged the necessity of convertible paper money, and argued against relying upon the precious metals as the sole currency, see speeches delivered 25th Sept. 1837; 19th Feb. 1838; 20th Jan. 1840. From 1842 till 1849 Clay retired from active political life, although retaining the position of adviser of the Whig party. He died in 1852. For life and works see *Works of Henry Clay*, edited by Calvin Colton, 6 vols., New York, 1863. The last two volumes contain the speeches.

D. R. D.

CLAYTON, DAVID, author of *A Short System of Trade, or an account of what in trade must necessarily be advantageous to the nation, and what must of consequence be detrimental*, London, 1719. "Multitudes of people fully employed in beneficial trades" being advantageous, the importation of foreign manufactured goods is "of consequence detrimental." The writer alludes to "a pamphlet published about two years since, entitled 'A short but thorough search, etc.', which is now again reprinted with some alterations and large additions."

CLEARING SYSTEM

Clearing Houses, p. 305; London Bankers' Clearing House, p. 306; Provincial Clearing Houses, p. 307; Foreign Clearing Houses, p. 307; Statistics, p. 309; Other Classes of Clearings, p. 310; Stock Exchange Clearing, p. 310; Beetroot Sugar Association, p. 310; London Produce Clearing, p. 311; Railway Clearing, p. 311; Cotton Clearing, p. 311.

CLEARING HOUSES. The circulation of a bill of exchange, draft, or cheque through several hands accomplishes something more than the settlement of the original transaction out of which it arose. It completes many intermediate business operations by the delivery perhaps of a single document instead of by telling over a quantity of currency several times. It thus effects important economies of currency and of labour. But for the final liquidation of the document there is still required the trouble of presentation, the provision of currency, and the labour of counting this, besides the risk of storing and of carrying it.

X

In some or all of these points a clearing system carries economy yet further. The principle of the clearing system is payment by "set-off," or the "clearing" off certain claims by counter-presentation of other claims, leaving only a single balance to be settled by actual payment. Economy to this extent may be obtained by the least developed system of clearing, as existing in many towns, where each bank presents to the other banks all drafts which it holds on them without requiring payment at the time, settlement being made subsequently by paying the balances between the cross deliveries. The next advance is the establishment of a clearing house or common place of meeting. By this means presentation may be made to many different members within the compass of a single room, and each of those members will have but the labour of a single journey. A further economy is secured in the settlement by book entry of the final balances resulting from the claims mutually admitted. With this arrangement the use of currency is eliminated from the whole chain of transactions, from the first drawing of a bill or draft to its final payment. The system is effective entirely in proportion to the economy obtained, and our estimate of its value must depend upon (a) the completeness of the chain of adjustment; (b) the magnitude of amounts discharged; (c) the number of drafts presented; (d) the number of parties making and receiving presentation; and (e) the difficulties of separate presentation, otherwise necessary. Great diversity may exist in the arrangements. It will therefore be desirable to describe the methods adopted at some of the chief clearing houses of the world.

The LONDON BANKERS' CLEARING HOUSE, established between 1750 and 1770, now includes (1891) twenty-six members, all being bankers, doing cash deposit business in the city. The clearing-room is a large apartment of irregular shape, lighted from the roof. Around the walls and in a double row in the centre are placed desks allotted to each bank, according to the extent of its business. The banks are placed in alphabetical order, so that the clerks can pass around the room and deliver the "charges" without confusion or risk of error. In describing the operations it is necessary to use technical terms and to remember that the "out" and the "in" clearing comprise the same items, having regard to their presentation by one bank and their reception for payment by another. Thus the "out" clearing of each bank, *i.e.* the cheques, etc., for which each bank has to receive payment, becomes part of the "in" clearing of every other bank, *i.e.* the cheques, etc., which every other bank has to pay. The "out" clearing is taken down at the bank offices in sheets or books in separate "charges," according to the bankers drawn upon, whilst the "in" clearing is taken down in the same way at the clearing

house by clerks who go there for the purpose.

The first "clearing" is held from 10.30 A.M. till 12.0 noon, all drafts having to be delivered at the desks by 11. The clerks receiving the "charges" enter the items in their "in" clearing-books, and cast them, agreeing the totals with amounts placed on the back of the last cheque. When this is completed the clerks leave the house, taking the drafts to their respective offices. No balances are struck for this clearing, the total of each "charge" being carried forward to the beginning of the second clearing. This opens at 2.30 P.M., and continues until 4, when the last delivery must be made. The arrangements differ from those of the morning clearing only in the fact that the deliveries are continuous and frequent throughout the afternoon. At 4 the doors of the house are closed, and no more drafts can be presented. As soon as the last drafts have been despatched from the banks, the "out" books are cast close and sent down to the house to be agreed with the "in" books of the other banks. Differences in adding the figures together are rectified by the bank in error, but differences in items are altered by the "out" clearers to agree with the "in" clearers. Subsequently the difference may be reclaimed by production of the draft. Drafts refused payment are returned at any time during the afternoon by inclusion in the "out" charges to the banks by whom they were presented. "Returns" are also received at the house after the close of the clearing, and up to 5.0 P.M. The totals having been agreed, the balance between the "out" and "in" amounts is struck by each bank with every other one, and the last "returns" are charged and allowed on either side. All these balances then form items in a general balance-sheet, which is prepared by the head clearer of each bank, and shows at foot the final balance which his bank has either to pay or receive. This balance is settled with the clearing house by means of transfers made at the Bank of England between the clearing house account and those of the various banks. Of course, if the final balance-sheets are all correctly made out, the total of the transfers to the credit of the clearing house will exactly equal the total of the amounts transferred from that account to those of the creditor banks. Errors are charged or credited to the banks in the next day's clearing.

Country Cheque Clearing.—Besides the clearing between the city bankers, a clearing for drafts drawn upon banks throughout England and Wales is held daily at the London clearing house. In economy of labour this is the most complete example of the advantages of the system, its net result being, shortly, this—that every country banker can make presentation of any number of cheques, drawn on any of about 2100 country banking offices, by sending one

letter to his London agent; he can receive payment therefor by one line in his London banking account, and can in the same manner make due payment for any number of cheques drawn upon himself. The clearing is limited to cheques or drafts on demand, and by the boundaries of England and Wales, being one day's post from London. With only the most insignificant exceptions it embraces every bank outside the metropolis, from Land's End to the Tweed.

The particulars of the arrangement are as follows. Every country bank has as London agent one of the London clearing bankers, who conducts on his behalf the clearing now referred to, as well as other business that he may require to do in London. Each country banker makes up daily all the cheques drawn on other country banks which he has received, and forwards them by the evening mail to his London agent, accompanying the parcel with a detailed list of the items. The London banker, receiving them on the following morning, after examination of the parcel, sorts the cheques according to order of the various clearing bankers, as agents of the banks drawn upon, charging them in "out" clearing books, and delivering them at the clearing house. The meeting for this purpose is held daily from 12.0 noon till 2.15 p.m., the cheques being entered at the house in "in" clearing books, and the totals agreed in the same manner as in the town clearing. No balances are struck until the day next but one, when the head clearer of each bank prepares a balance-sheet, composed of the various balances he has to pay or to receive, on account of the cheques exchanged two days before. The final balance shown between his own bank and the clearing house is carried forward as an item in the general balance-sheet prepared at the close of the day's town clearing. On the first day, when the exchanges are made, the cheques received by each bank as "in" clearing are taken to the office and sorted afresh in order of the country banks on which they are drawn. They are then entered in books, and sent down by the evening's post, accompanied by lists. The country bankers, receiving them the next morning, have the whole day for examination, and then, in the daily letter to their London agents, advise them to debit their account with the total. On receipt of this advice the London bankers are able to make payment at the clearing house as already described. Unpaid cheques are returned through the post by the banker refusing them, direct to the banker whose name is stamped across them, and the particulars are communicated (technically advised) to the London agents, who claim the amounts from the agents of the bankers to whom they have been returned.

No official figures are available to show either the number, or the total amount, of the cheques

included in the country cheque clearing. Calculations appear to show that the number of cheques passing thus through London has probably reached 20,000,000 in a single year, with a total value of about £450,000,000. In this case the economy of currency is considerable, but the economy of labour is even greater, and still more important is the expansion in the business of the country bankers rendered possible by it, as it has enabled them to offer to their customers facilities, in respect of the negotiability of their cheques, almost equal to those enjoyed by customers of London banks.

PROVINCIAL CLEARING HOUSES. There are clearing houses or clearing systems at Manchester, Liverpool, Birmingham, Newcastle-on-Tyne, Leeds, Sheffield, and Bradford. In some cases the arrangements have not gone as far as the establishment of a clearing house, but the members obtain facilities in other ways. In several instances the clearing includes cheques drawn not only on the members actually presenting, but also on their branches within a specified distance of the centre. At Sheffield the local clearing circle has a radius of some twenty-five miles. There are also various degrees of economy and convenience in the manner of paying the balances due. Sometimes they are settled by bank notes, sometimes by transfers between their accounts at the Branch Bank of England, or by payments made and received through the London agents. In Scotland there are clearing houses at Edinburgh, Glasgow, Aberdeen, Dundee, Greenock, Inverness, Leith, and Paisley. The arrangements generally include note exchanges, and also a highly organised system of clearing for drafts on any or all of the numerous branches. In Ireland the only clearing house is at Dublin. In Canada there are clearings at Montreal, Toronto, and Halifax; in Australia, at Melbourne and Sydney. As all the Australian banks have many branches their internal transactions do much to diminish the necessity for clearing houses.

FOREIGN CLEARING HOUSES. In the United States great use has been made of the clearing system. Although not introduced there till 1853, when the New York Clearing House was established, the number of such institutions, and the extent of their transactions, already exceed those of Great Britain. This is due not only to the general readiness with which the Americans avail themselves of every economic arrangement, but more particularly to the peculiarity of their banking system. None of the banks in the United States have any branches, nor is there any considerable number of large banks. Even in New York there are only two banks whose net deposits amount to four millions sterling, whilst the whole banking deposits of the country, which may be put at about 500 millions sterling, are divided among about 6900 banks. Each bank being

an entirely separate institution, there is little of that internal clearing performed in every large bank by the cancellation of drafts appearing on both sides of the books. In these circumstances the clearing house becomes a necessity, even where the total amount of banking business is comparatively small. In 1890 there were 60 clearing houses operating in the United States, comprising about 700 members. All these institutions have arrangements much alike, conforming generally to those of the New York Clearing House, where the method of transacting business differs entirely from that adopted in London. The New York Clearing House includes 65 members, whose representatives meet once a day only, at 10 A.M. Each bank sends two representatives, a clerk and a messenger, who arrive before the hour named, at which time every clerk is required to be at his appointed desk, with his messenger standing outside it. At a signal from the manager, who is stationed in an elevated desk overlooking the room, every messenger moves forward to the desk next his own and presents to the clerk there a sealed envelope containing the cheques drawn on the bank for which that clerk acts, with a slip pasted outside showing the particulars of the items and their total amount. He presents also a list printed with the names of all the banks, and having the amount presented entered against each of them. The clerk receiving the envelope signs for the amount and returns the list to the messenger, who goes to the next desk in the same manner, and so on until he has made the circuit of the room, and delivered all his envelopes. The whole operation of exchange is thus performed in about ten minutes. The clerks receiving the envelopes, without opening them, enter the amounts on printed lists, and make up the total, which, compared with the total of the list of envelopes delivered by their own messengers, gives a balance to be paid to, or received from, the clearing house. The messengers then take back to their respective offices the envelopes received, and the clerks remain behind to report their amounts to the managers, and to agree on the balance due. This done, the clerks leave the house; the whole clearing having occupied probably less than one hour. The debtor banks have then to pay over to the clearing house, by 1.30 P.M., the balances due from them, after which the creditor banks can receive, at the same place, the balances in their favour. Neither in New York nor in any city in the Union is there any bank occupying a position similar to that of the Bank of England, and therefore the balances cannot be paid by transfer. Formerly they were paid in legal-tender notes, or in gold coin, but this entailed a vast amount of labour. On one day, in 1879, the value of coin passing through the clearing house was £1,660,000, and its weight was about 15½ tons.

Besides cost of time and labour involved in handling the coin, much loss was suffered by abrasion. Subsequently the clearing banks made a deposit of gold in the vaults belonging to one of their number, and certificates were issued against it for \$1000, \$5000, and \$10,000 each, which were passed in payment of balances. Recently this plan has been abandoned, and payment is made, as to the chief amounts, in certificates issued by the United States Treasury for gold coin deposited there, and as to lesser amounts, in legal-tender notes and minor coins.

There is not at present any system similar to that of our country cheque clearing, and the inconveniences suffered by the banks in the United States for want of such a system afford a good illustration of the advantages derived from it here. In the absence of due facilities the banks have a custom of forwarding cheques drawn on one town to any town in its vicinity to which they may be making remittance, on the chance of the bank there having to remit to the town on which the cheque is drawn. Frequently, however, this turns out not to be the case, and the cheque is sent backwards and forwards between one town and another, sometimes remaining out for many days before finally presented, and, if unpaid, taking as many days more in return. The enormous distances comprised within the limits of the Union would render it difficult, if not impossible, to arrange for a general system of clearing through a single centre. The course of development will therefore probably be in the direction of the establishment of local clearing circles.

On the continent of Europe, the entirely different degree in which banking has progressed has tended greatly to restrict the use of clearing-houses. Although the earliest system of clearing of which anything is known was that which existed for some centuries at Lyons, France has even now made but little progress towards adopting this economy. The Paris Chamber of Compensation, established 1872, is the only one in the country, and its transactions are very small. Several causes have led to this, chief among which is the small extent to which the daily transactions of trade are carried out through banks. Cheques were quite unknown before 1859, and their use has not even now become general. Business is chiefly carried on by means of notes, coin, and small bills, the latter being generally payable at the offices or residences of the drawees. On one day, 31st Jan. 1891, the Bank of France collected in Paris 235,669 bills, payable at 75,455 dwellings, the total value being £6,169,640. The Bank of France itself through which by far the greater part of the banking operations of the country are carried on, had, in 1891, only 4992 current accounts open at Paris, and 9229 among its 94 branches. The need for a clearing house is still further lessened by the fact that the greater

part of such business is carried on through three banks only, namely the Bank of France, the Société Générale, and the Crédit Lyonnais. As these establishments have between them some 100 branches, they are able to settle a large proportion of their transactions within their own offices. The Bank of France has special arrangements for this purpose, and the amount annually "cleared" within its walls is seven or eight times as large as the total passing through the Chambre de Compensation. A still greater amount is probably that which is affected by the arrangement under which the operations of the Bourse, not only in Paris, but in the other chief cities, are liquidated within the Bourse itself by means of the "Compagnie des Agents de Change de Paris." These remarks apply with little variation to the banking arrangements in the other countries of Europe. Where there is no general use of cheques there is no great necessity for a clearing house, and throughout the continent a "bank" exists more as an establishment of credit than as a medium of currency. In Berlin, the clearing was established by the Reichsbank so recently as 1884, as part of a general movement to extend the use of cheques. There, also, the transactions of the stock exchange are, and have been since 1871, liquidated by "set-off" in a separate institution, the Bank des Berliner Cassen-Vereines. A clearing house exists at Hamburg, continuing arrangements long carried on by the Bank of Hamburg; and there are similar institutions conducted by the branches of the Reichsbank at Frankfort, Cologne, Bremen, Leipzig, Stuttgart, Breslau, and Dresden. At Vienna, arrangements which previously existed among several banks, were consolidated, in 1872, into a regular clearing house. Its operations have not been very considerable, nor have they shown any tendency to increase. The operations of the Bourse are liquidated separately by the Wiener Giro- und Cassen-Vereine. In 1881 the amounts so liquidated were fourteen times as great as those passed through the clearing house. In Italy, thirteen clearing houses were established by royal decree in 1881, to assist the resumption of specie payments, but the development of banking there did not require their continuance, and only those of Rome, Milan, Florence, Genoa, Catania, and Bologna still exist, besides that at Leghorn, established long previously.

STATISTICS. Full tables of the amounts passing through the various clearing houses of the world cannot be given here, but a few of the most important figures will show the extent to which currency at least is economised by the system. Some considerations should always be borne in mind in connection with tables of clearings which are otherwise likely to mislead. The amounts cleared at one time or place, as compared with other times or places, do not

directly indicate the relative extent of trade or of banking development. They may vary with (1) the number of separate members included in the clearing; (2) the proportion they bear to the whole banking system of the place; (3) the existence there of other institutions having similar objects; (4) the manner in which returns are made. In connection with point 1, it is evident that the greater the number of banks in the clearing the greater will be the proportion of their whole transactions passing through the house. The larger any individual business is, the larger will be the proportion of its transactions cancelled in its own office. The same applies to point 2, because banks outside the clearing, though they may clear through members of it, have still a large number of transactions settled internally, and thus removed from view. This also applies with still greater force to banks with many branches. Point 3, the extent to which arrangements are in existence for liquidating separately any particular class of financial engagements, must obviously materially affect the amounts cleared. The remarks already made on this subject as to the clearings at Paris, Vienna, and Berlin sufficiently show its importance. On the other hand, the absence of special settling days for bargains between members of the Stock Board in New York tends to increase the amounts passing through the bankers' clearing. Point 4, the totals of one side only are usually quoted, but in the earlier returns of some American clearings, and in some continental clearings at the present time, both cheques brought in and those taken away are included, thus doubling the figures.

With regard to the proportion between amounts cleared and balances paid over in settlement, their relation will depend generally upon the number of members in the "clearing," but it may also be affected by other circumstances. Thus the balances paid in the London Clearing House are very largely increased by the Bank of England clearing on one side only, the debtor balances of all the other banks being thus increased to the extent of the whole of their claims upon the Bank, which are by the present arrangement paid in as "credits" at the Bank

counter. In point of economy of currency, however, this is immaterial as the final settlement is made by book entry.

OTHER CLASSES OF CLEARINGS. The principles of clearing have been applied, with more or less completeness and success, to the settlement of transactions in commodities other than money, and some examples of those arrangements must now be briefly referred to. Whilst the clearing houses described above have differed only in the degree of their organisation, institutions for dealing with commodities are capable of variation in another direction. They may deal with either or both of two terms instead of with the single term, money. A number of bargains in any movable property may be settled by the principle of "set-off," either as to delivery of the property or as to payment of its value, or as to both of these points. One feature, however, is common to all clearings, and that is uniformity of the article dealt in. A clearing can only be held under these circumstances, as it is the essence of the principle that the last buyer or receiver is equally satisfied by delivery from the first seller as he would be by delivery from the person of whom he actually bought.

These conditions are present in bargains in stocks and shares, and it is in connection with stock transactions that the most extended application of the clearing system to dealings other than those in money has been made.

The STOCK EXCHANGE CLEARING has been in operation in London since 1874, and though its use is neither obligatory nor universal among the members of the stock exchange, it has undoubtedly effected a very material saving of labour. Nothing whatever is known of the amounts settled by its means, although, no doubt, they are already very considerable, but it cannot be said to effect any economy in currency, as the transactions liquidated there would otherwise be settled by cheques. Still, those amounts, whatever they may be, are so much withdrawn from the returns of the Bankers' Clearing House.

The clearing is held within the precincts of the stock exchange, and is under the sanction and control of the committee. It is not applied to the settlement of general business, but only to bargains in certain stocks, and those such as are the subject of frequent speculative transactions. These comprise most classes of foreign government bonds and some particular English railway stocks. As it is not in universal use among the members of the exchange, any dealer who desires to settle his bargains through the clearing is able to do so only with regard to certain stocks, and even in those is limited to his bargains with such other members as also clear. The clearing is carried on entirely by means of balance-sheets and tickets; neither stock nor money in any form being received at the clearing house. On the settling day each

member forwards to the clearing house a balance-sheet for each particular stock, giving on the one side the amounts of the stock purchased and to be received by him, and on the other the amounts he has sold and has to deliver, together with, in each case, the name of the seller or buyer. At foot is shown the net balance which he has to receive or to deliver. At the clearing house each item in this list is ticked off or cancelled against the corresponding item in the sheet furnished by the other party, until the balances only remain outstanding. The total of the balances of stock deliverable will then exactly equal the total of the balances of stock receivable, although the items making up each total will be different. Those who have to deliver stock are then furnished with tickets giving the separate amounts into which their balance has to be divided and the parties to whom they are to be delivered; whilst those who have to take in stock receive tickets showing by whom it will be delivered. The receiver pays to the party delivering the stock its value at a fixed price, which is settled on the account day, and is called the "making-up price." All differences between this price and those at which the various bargains were made are settled directly between the dealer and those with whom he has dealt. No particulars are obtainable of the transactions which are settled in this manner, but as the clearing is chiefly used by those dealers and brokers who transact speculative business, and the stocks which clear are only the most speculative and "active" classes, it is probable that the bargains "cleared" are among the heaviest in each "account." The existence of this arrangement is therefore a consideration of some importance in any comparison of the returns of the London Bankers' Clearing House before and after 1874. The liquidation of transactions on the Bourse at Paris is much more complete in its organisation, and applies to all the operations of the Agents de Change. In Vienna and Berlin the compensations effected by the institutions already mentioned also cover the greater part of the Bourse transactions.

THE BEETROOT SUGAR ASSOCIATION OF LONDON established (in 1888) some arrangements for clearing bargains in beetroot sugar upon the following basis. The bargains to be cleared must always have reference to sugar of a certain range of quality, and to lots of 500 bags, each containing a certain weight. A broker having sold a quantity of sugar, starts a *filière* for each 500 bags, describing thereon the ship or warehouse marks, and all other necessary particulars. The *filière* is a sheet of paper printed at the head with the conditions of sale, and with spaces for insertion of the particulars referred to. It contains also a series of transfer forms which are filled up and signed by each successive holder, transferring the property to a new

urchaser. At the same time the purchaser signs a coupon form which is printed at the side of the transfer, quoting the date and hour of the sale. This is detached, and retained by the seller as evidence to determine any liability consequent on delay in passing on the *filière*. Any purchaser requiring delivery of the sugar can send the *filière* to the clearing house, instead of passing it on, and his name is then communicated by the officials to the first seller who tenders him the warrant direct. The *filieres* may pass from hand to hand within a limit of six days, at each transfer a stamp being affixed for the clearing fee. The differences between each of the successive bargains are calculated to the profit or loss of the seller. In the former case, the clearing house issues a cheque in his favour; in the latter case notice is sent of the amount due, which he is required to pay immediately to the bankers of the association. All the intermediate parties being struck out, any difference in the quality or weight of the sugar ultimately delivered concerns only the first and last parties, who settle it between themselves. The arrangement appears to be very complete, and as the advantages are considerable, it is already largely used. It must therefore make a great difference in the amounts of money passing in the trade. It is not unusual for *filieres* to pass through twenty hands before delivery of the sugar, and as a lot of 500 bags is worth, roughly, about £600, the transactions represented in such a case would amount to £11,400, of which eighteen transfers amounting to £10,800, would be struck out, leaving only one amount of £600, and sundry small differences to be settled by actual payment. Besides this economy, there is the saving in clerical work, the avoidance of risk in delivering warrants from hand to hand, and of delay in tendering warrants, with a consequent saving of much expense in demurrage.

LONDON PRODUCE CLEARING. An institution under this name was started in 1888, to regulate and adjust bargains in colonial and foreign produce. At first its operations were confined to coffee and sugar, but they have since been extended to wheat and silver. The chief object of the company is to guarantee both to buyer and seller the fulfilment of bargains for future delivery. This it does upon payment by the contracting party of a margin sufficient to secure the company from loss. Indirectly, a certain amount of economy by clearing is effected, because transactions accumulate on either side during the month, and are settled at the end by payment of balances only. In this case also bargains are for commodities of a certain quality, and in specified quantities, or multiples thereof. If the clearing came to be extensively used, there would be a great saving in the amounts of cheques drawn. Other institutions upon the same lines are the "Caisse

de Liquidation" at Havre, and the "Waaren Liquidations Casse" at Hamburg. For the "Cotton Brokers' Bank" in Liverpool, *v. COTTON CLEARING*. In the tea-trade, the Tea Clearing House is only for economy of labour, by providing a central office for the lodgment and delivery at the various docks and warehouses of warrants, and orders for various purposes. Further, it is to be observed that by the extension of the warehouse system, a species of clearing is effected as regards the handling of goods, by warrants, which are used for intermediate transfer, whilst delivery is only made to the last buyer. Among the most important examples are the warrants of Connal's Stores at Glasgow, for pig-iron; and, in the United States, the certificates of the United Pipe Line for petroleum, and the system of grading and storing wheat as adopted at Chicago.

Finally, the RAILWAY CLEARING HOUSE requires some notice, although it has other objects than settlement by "set-off." Its main purpose is to settle all the balances that arise out of through-booking, and to split up into different proportions the sums that are received for transport of goods or passengers, where they pass over different lines. For this purpose the railways send to the clearing house daily reports of all compound tickets issued at each station, and of all amounts charged for through carriage of goods. All spent tickets collected are also sent up to be compared with the accounts rendered. From these particulars the various companies are debited with the amounts received by them, and credited with their proportion of the work done according to the mileage of their line covered, the haulage, and the ownership of coaches, trucks, or tarpaulins used. Of course the principle of clearing is brought into play in effecting the settlement of all these claims. A regular debit and credit account is kept with every railway, and it is only called on to make payment when a considerable sum is owing, or when the set of the balances is all one way.

[For full details and statistics see *Our Clearing System and Clearing Houses* (Howarth).—*Clearing Houses et Chambres de Compensation* (François); and also various papers in *Journal, Institute of Bankers*, vol. iii. 1881-82, and subsequent years. As to amounts settled outside of clearing houses, see "Proportionate use of Credit Documents and Metallic Money in English Banks" (Pownall), *Journal, Inst. Bankers*, vol. ii. 1880-81.] R. W. B.

COTTON CLEARING (COTTON BROKERS' BANK). The principle of payment by "set-off" of differences has been applied to the very heavy monetary transactions arising from dealings in cotton at Liverpool. The system employed is fully described in the *Bankers' Magazine* for July 1887. No fewer than forty-six different forms for contract, orders for delivery, etc., may have to be employed in the process, and eleven

more connect the "Cotton Brokers' Bank, Limited," as the association through which the business passes is termed, with the clearing conducted by the branch Bank of England at Liverpool. The numerous forms mentioned are required to meet the various requirements arising out of the re-sale of the bales of cotton dealt with. These may pass through many hands after being in the possession of the original purchaser, before being finally disposed of. Insurance against risk by fire, the possibility of need for arbitration, in case of dispute and of appeal against an award, the different methods of dealing according to the special rules in force, whether the cotton comes from America or India, all the various incidents which may arise in the conduct of a very complicated business, are provided for through these arrangements, as well as the ultimate disposal of the money arising therefrom. The result has been a vast economy in labour, as well as in the use of the circulating medium. "Formerly all cotton was paid for in cash. Now all the effects, whether cash, cheques, bankers' drafts, or transfers (both by post and telegraph) are lodged with the Bank of England for the credit of the Liverpool Cotton Bank, Limited, clearing account. The members of the cotton bank then transfer the amounts required from one to another at the cotton bank, and at the end of the day the cotton bank sends the completed pay list to the Bank of England, and the ultimate receivers have cheques for their amounts. The object of the clearing house of the Cotton Association is to settle the very numerous sales and re-sales of an individual parcel of cotton by collecting and distributing the 'differences' due by, or to, the respective buyers and sellers. Formerly each transaction was settled, as any ordinary purchase or sale is, by the parties concerned; a very great economy in the labour of the process, as well as in the use of the circulating medium, is obviously effected by means of the 'cotton bank' and its connection with the Bank of England" (*Bankers' Magazine*, 1887, p. 591). The arrangements, though apparently simple, must have required an immense amount of technical knowledge and intelligence to put into shape.

CLEMENT, AMBROISE, born at Paris 1805, died there 1886. From 1838 to 1848 and from 1850 to 1860 A. Clément was secretary to the mayoralty of Saint Étienne, and, in this capacity, rendered important services to that city, for example, successfully opposing, the establishment of store houses for grain (GRENIERS D'ABONDANCE, *q.v.*) desired by the imperial prefect of the Loire. He was one of the organisers and workers from the beginning in the *Dictionnaire de l'économie politique*, and wrote many articles in the *Journal des économistes*. His works are noteworthy on account of the firmness of their principles and

their logical accuracy. He was faithful all his life to the principles of his master, J. B. Say, as his following works show; *Recherches sur les causes de l'indigence* (1846 in 8vo).—*Des nouvelles idées de réforme industrielle*, referring in particular to the project for the Organisation of labour by M. Louis Blanc (1848 in 18mo); *Essai sur la science sociale* (1867, 2 vols. in 8vo).—*Le bon sens dans les doctrines morales et politiques*, or the application of the experimental method to philosophy, moral sciences, and political economy (2 vols. in 8vo); finally, *La crise économique et sociale en France en 1886* (large 8vo), his last work. A. C. F.

CLÉMENT, PIERRE, born at Draguignan 1809, died 8th November 1870. He held a high official post in the ministry of finance, and entered the Institute (*Académie des Sciences morales et politiques*) through the imperial decree of 14th April 1855.—All Pierre Clément's works consist of historical investigations conscientiously written, laboriously treated, and touching on financial questions, approached on the economic side. The following is a list of his principal works in order of publication: *Histoire de la vie et de l'administration de Colbert précédée d'une étude sur Nicolas Fouquet*, 1846 in 8vo (his best work, which obtained a prize from the *Académie Française* in 1848); *Le Gouvernement de Louis XIV.* (1683 to 1689), a continuation of the preceding (honoured with the second Gobert prize by the *Académie des Inscriptions et Belles-lettres* in 1848).—*Jacques Cœur et Charles VII.* (1853 in 18mo, prize from the *Académie Française*).—*Histoire du système protecteur en France de Colbert à 1848* (1854 in 8vo), a work written in the spirit of free trade; *Portraits historiques* (1855 in 18mo).—*Trois drames historiques* (in 18mo).—*Enguerrand de Marigny, Beune de Semblançay et le Chevalier de Rohan* (in 8vo and in 18mo); lastly *M. de Silhouette, Bouret et les derniers fermiers généraux* (1872 in 18mo), this work was completed by Alfred Lemoine and published after the death of P. Clément. It was due to the labours of Pierre Clément that an important publication, *Les Lettres, Instructions, et Mémoires de Colbert* (1861-73, 7 vols. large 8vo), undertaken by the imperial government was successfully completed. The *Académie Française* voted its highest honours to this collection. A. C. F.

CLEMENT, SIMON (fl. 1695-1720), merchant of London. In 1696 he was concerned, along with other merchants, in an infringement of the NAVIGATION ACT (*q.v.*) by allowing a ship to be worked with a crew less than three-fourths of whom were English sailors. A plan which he proposed in 1708, for the importation of pitch and tar, was favourably considered by the government. From 1712-1714 he appears to have resided at Vienna; and in 1720 we find him presenting a memorial on behalf of the widow of William Penn, whose will was

disputed. He published *A Discourse of the General Notions of Money, Trade, and Exchanges as they stand in relation each to other, attempted by way of Aphorism, etc.*, by a Merchant, London, 1695; and *The interest of England as it stands with relation to the trade of Ireland considered, etc.*, London, 1698, 4to. Clement's pamphlets are well worth studying. Though not free from mercantilist errors, he anticipated in some respects the conclusion of later writers. He pointed out that "silver and gold . . . are to be considered but as a finer sort of commodities; and as such are capable of rising and falling in price, and may be said to be of more or less value in divers places, according to their plenty or scarcity. Bullion then may there be reckoned to be of the higher value, where the smaller weight will purchase the greater quantity of the product of manufacture of the county." In an appendix, "offering some further reasons against raising the value of our coin," he opposed the views expressed by WILLIAM LOWNDES (*q.v.*) in his *Essay for the Amendment of the Silver Coins* (1695). Davenant quotes with approval Clement's "judicious observation," in his pamphlet on the trade of Ireland, "that if any one offers his goods cheaper than the usual price, that will then become the market price; and every one else must sell at the same, or keep his goods."

[*Cal. of Treasury Papers*, xxviii. 56; cvii. 40; cix. 22; clxxii. 37; ccxviii. 18.—Davenant, *Essay, etc. on the Balance of Trade* (1699), 123; *Brit. Mus. Catalogue*; *Cat. Bibl. Bodl.*] W.A.S.H.

CLERGY, BENEFIT OF. "Originally consisted in the privilege allowed to a clerk in orders, when prosecuted in the temporal court, of being discharged from thence and handed over to the Court Christian, in order to make canonical purgation."—(Stephen's *Commentaries on the Laws of England*, vol. iv. bk. vi. ch. xix.)

CLIENT. This word is derived through the French from the Latin *cliens* (*cliens* from *cluere*, to hear), which in one of its derivative senses signified a person who employed a *patronus* or *advocatus* to assist him in his cause (see Smith's *Dict. of Antiquities*, s. v. *cliens*).

A client is a person who engages a barrister or solicitor for the purpose of obtaining their professional advice or assistance. It is a rule of professional etiquette that a barrister should be engaged through the agency of a solicitor. Hence the solicitor is called the client of the barrister he briefs. The person whose cause is in question is also said to be the client of the barrister. The relation between barrister and client is not, like that of solicitor and client, a contractual one, a barrister not having a right like a solicitor to sue his client for his fees. This rule, that only an honorarium is due to a barrister, is derived from Roman law. E.A.W.

CLIENT, STOCKBROKER'S. The stockbroker

regards his principal very much as a solicitor regards his client. In most cases a novice has to be advised as carefully about his investments as a litigator is advised by his solicitor. A.E.

CLIFFE LESLIE. See LESLIE, J. E. CLIFFE.

CLIPPED MONEY. Until 1663, English coins were not marked or milled on the edges, and the practice arose of clipping small pieces off the coins. By 3 Henry V. c. 6, clipping washing, or filing the coin of the realm was declared high treason. This act was repealed by 1 Mary, sess. 1, c. 1, but its provisions were re-enacted and extended by 5 Eliz. c. 11, and 18 Eliz. c. 1. The introduction of milling tended to prevent clipping, but during the 17th century clipping was a common offence owing to the large gains resulting. Notwithstanding the re-coining of Elizabeth and the issue of new coins in subsequent years, the amount of clipped coins steadily increased, the new coin being melted down or exported. It was estimated that the coinage had lost one-third its weight. In 1695, provision was made for restoring the coinage to its full weight: the cost, amounting to £2,703,164, being met from the hearth-tax.

[Lowndes' *Essay for the Amendment of the Silver Coins*, 1695.—Macaulay's *History of England*, vol. iv.—*First Nine Years of the Bank of England*, by J. E. T. Rogers, Oxford, 1887.] J.E.C.M.

CLOFF OR CLOUGH. An allowance of 2 lb. in every cwt. after tare and tret have been deducted. It is given to cover small losses in retailing.

COALITIONS. See TRADES' UNIONS.

COASTING TRADE. Coasting trade is trade carried on by sea between the various ports of the same country or state, and therefore in the case of this country includes the intercourse between Great Britain and Ireland (39 & 40 Vict. cap. 36, § 140). From the time of Elizabeth, if not before, the coasting trade was reserved to British subjects by various acts of parliament including the navigation acts of 1651 and 1660; but by the act of 17 Vict. cap. 5, this restriction was swept away, and all nations have since participated in our coasting trade. As, however, only 121,000 tons of foreign shipping were entered in 1888 in the coasting trade, compared with the 27,000,000 tons of British shipping, the effect of this free trade measure may be regarded as more moral than material. Many foreign countries have followed our example in this respect, allowing ships of other nations to share in their coasting trade, but there are still several notable exceptions, such as France, Russia, Spain, Greece, and the United States, where this trade is still reserved to the national flag. If the policy of allowing the utmost competition in carrying goods to and from our shores is a right one, it is difficult to maintain that the same competition is undesirable in trade between the various ports. The great bulk of the articles so

carried are raw materials, such as coals, bricks, timber, and the like, for which the cheaper carriage of the sea compared with that of the railway is a necessity, and we do not wish to endanger this cheap carriage by excluding competition. The regulations imposed on ships and cargoes in coasting trade are much less stringent than those on foreign-going ships. The following are the principal regulations prescribed by the act 39 & 40 Vict. c. 36. Foreign ships are subject to the same regulations as British as to stores, etc., and may not be subjected to higher local dues (§ 141). Under the following section (142) no goods are to be carried coastwise except those laden at some port or place in the United Kingdom, but under recent regulations in pursuance of the Revenue Act of 1884, a ship arriving from abroad is allowed to ship non-dutiable goods for coasting after discharging part of her cargo, and conversely a vessel which has been conveying goods coastwise is allowed to retain part of the cargo on board for exportation abroad. The master of the coasting ship has to keep a cargo book in which he enters particulars of the goods taken on board and discharged at the various ports, for the correctness of which he is liable under a penalty of £20 (Customs and Inland Revenue Act 1879, § 9). Before leaving any port, a document called a *transire* has to be signed by the collector of customs, and is the authority to the master to clear for the next port (39 & 40 Vict. c. 36, § 145). Fishing boats are exempt from even the light regulations of the ordinary coasting trade, and are entitled to carry from one part of the coast to another, besides their own fish and fishing appliances, a variety of bulky goods, such as ashes, bavons for bakers, bricks, stones, slates, clay, sand and gravel, lime, tiles, timber, and hay and straw. Fishing boats, however, exceeding 15 tons burthen must be registered under the Merchant Shipping Act of 1854.

The following table shows the growth of the coasting trade of the United Kingdom since 1850, at intervals of ten years.

	1850. ¹	1860. ²
	Tons.	Tons.
<i>Tonnage employed in the general coasting trade—</i>		
British	10,979,574	11,342,532

In France the tonnage of vessels cleared with cargoes in coasting trade has been as follows, all the vessels being of French nationality :

1847-56	2,678,572	1884	3,914,127
1857-66	3,063,896	1885	4,158,064
1867-76	2,934,659	1886	4,443,486
1882	3,633,039	1887	4,856,585
1883	3,822,929		

(Tableau général du Commerce de la France.)

A. E. B.

COBBETT, WILLIAM, born at Farnham, Surrey, 1762, passed his early years in farm-labour, and, after a few unhappy months in a lawyer's office in London, enlisted (1784) in the 54th regiment of the line, and served with it seven years in Nova Scotia. Retiring as sergeant-major, in 1792 he began his literary career as well as his married life. He settled in Philadelphia, but he was too stout a champion of England against France to be left in peace, and in 1800 he found himself again in England. He was at first well received by Pitt and his supporters, but soon broke off connection with all political parties, becoming convinced that corruption, and place-hunting, and waste of public money prevailed with little difference among Whigs and Tories. He was thus a radical reformer ; but neither republican nor revolutionist. His ideals lay as much in the past as in the future. He deplores the Protestant Reformation, but, since there is now no hope of return to monastic charity, he lauds the old poor law, as being with Magna Charta the foundation of English liberties (see *Manchester Lectures*). He talked not of abstract rights of man, but of rights of Englishmen, founded on the old laws of England ; his desire was to make the poor labourers as comfortable as in his father's time. This was his strain in the *Political Register*, which he issued week by week for over thirty years (1803-1835). There was only one serious break, from 1810 to 1812, when the editor lay in Newgate, under punishment for a severe article on flogging in the

³ Before 1873, vessels employed in conveying ashes, bavons, bricks, tiles, clay, lime, gravel, iron ore, fresh meat and fish, hay and straw, timber and wood, and various other raw materials were omitted in the returns of tonnage.

army. In prison, besides studying Tull's *Husbandry*, he wrote his letters to the people of Salisbury, best known by the title *Paper against Gold*.

On his release he continued from his Hampshire farm to edit the *Register*. Embittered in spirit and reduced in fortunes, he was never more full of vigour in mind and body. The "White Terror" under Lord Sidmouth drove him in 1817 again to America, but he kept up his *Register* from his farm in Long Island, and returned in 1819 to his native country, with the bones of Paine as proof positive of his political conversion. Bankrupt through lawsuits in 1820, he quitted Hampshire for Kensington, still keeping tight hold of his pen. In the reformed parliament of 1832 he sat as member for Oldham till his death in June 1835.

His work in parliament was far surpassed in brilliancy and originality by his earlier achievements as a journalist. He was right in thinking that he was "of most weight as a spectator and commentator." As an agitator or man of action he showed little tact, taste, or knowledge of men; he was not a man of the world any more than he was a worldly man. The great obstacles to social reform seemed to him to be political, and it was because of what he thought to be their evil political influence, that he disliked the growth of the stock-jobbing commercial aristocracy of his day. He was in his eccentric way a labourer in the cause of popular education; he was an agricultural improver, importing the "locust tree,"¹ and trying to induce English farmers to grow Indian corn; he tried to revive cottage industries, especially straw-plaiting. He was intensely national, and yet his writings did more than most men's to make the American nation, and in a less degree the French, better understood by his countrymen. His strength lay in his clear logic and wonderful command of good homely English, as well as in his happy epithets. His chief failing was his vanity, pardonable in one who owed all his success to his own pertinacity, and all his education to his own diligence.

The discussion of economics apart from politics had no interest for him. Even his favourite subject, taxation, is treated simply with the sturdy common-sense of one whose views are limited, but whose powers of expression are boundless. Like Swift, he made excursions into economical regions, not because he was at all anxious to find truth there for its own sake, but because some prevalent economic error or other seemed to be hindering some project of reform which was dear to him. His antipathy to the economists of his time was not due to any general economic theories of his

own fundamentally different from theirs. He denounced Malthus, and he denounced Ricardo, because he saw their doctrines afforded too easy a handle to his political enemies, the "borough-mongers." But, in his diatribes against a potato-diet, he uses arguments identical with those of Malthus; and, in protesting against the new corn law of 1815, he states the case as Ricardo or any free-trader would have stated it. "There are few articles" (he says in his letter "To the Journeymen and Labourers of England, Wales, Scotland, and Ireland") "which you use, in the purchase of which you do not pay a tax. On your shoes, salt, beer, malt, hops, tea, sugar, candles, soap, paper, coffee, spirits, glass of your windows, bricks and tiles, tobacco. On all these and many other articles you pay a tax, and even on your loaf you pay a tax, because everything is taxed from which the loaf proceeds. In several cases the tax amounts to more than one-half of what you pay for the article itself; these taxes go, in part to support sinecure placemen and pensioners; and the ruffians of the hired press call you the scum of society." For the most part, when Cobbett has hold of an economical truth, he can put it more clearly than another man, and there is little fault to find except the exaggeration which seems to be inseparable from all political writing. The "Letter to the Luddites" (30th November 1816, *Weekly Political Register*) is not only one of Cobbett's most characteristic and ingenious papers, but it contains one of the clearest popular descriptions ever penned of the economical benefits of the invention of tools and machinery. If he treats taxation as if it were the only cause of distress, we must remember that in his days, and indeed till the repeal of the corn laws, it was probably the most potent cause. Even during the course of the French War, when there was more apparent reason for high taxes than in 1816, he was never tired of declaiming against excessive expenditure and over-taxation; and his letters on *Paper against Gold* are simply one skirmish in his general attack on these evils. The letters in question are a lively, and in the main an accurate history of the suspension of cash payments by the Bank of England in 1797, and the effects of it on the currency. He gets his principles not directly from the economists, but from Paine's *Decline and Fall of the English System of Finance* (1796); he compares the English inconvertible notes to the French assignats; and is not careful to avoid the exaggerations of the "Ultra-bullionists," who explained all the high and low prices of those times by the state of the currency. His assertion that the bank neither would nor could ever return to cash payments was not confirmed by facts. But, with all its defects, the book is valuable for its pictures of the opinions and conduct of average Englishmen at a momentous

¹ The acacia, which was then better known under its American name of "locust tree."

period in the economical history of the country. In the same way we owe much to the *Register* for its glimpses of English working men, and their views in the darkest years of this century.

Of Cobbett's numerous works the following are of most importance economically :—

The Weekly Political Register, 1803 to 1835.—*Paper against Gold*, 1810, 1811, reprinted 1817.—*Rural Rides* (reprinted from the *Register*), 1830.—*Two-penny Trash*, 1831.—*Tour in Scotland and in the four northern Counties of England*, 1833.—*A Year's Residence in the United States of America*, 1818.—*Cottage Economy*, 1821.—*Manchester Lectures*, 1832.—*Surplus Population and Poor Law Bill*, 1835.—*Legacy to Labourers*, 1835.—*Legacy to Peel*, 1835.—*Legacy to Parsons*, 1835.

[His biography is given by himself incidentally throughout his works (for example, in *Advice to Young Men*, 1830, and in the *Year's Residence in America*).—See also *William Cobbett, a Biography*, by Edward Smith, 2 vols. (Sampson Low, 1878).—George Gilfillan, (second) *Gallery of Literary Portraits*, 1849.—Adolf Held, *Soziale Geschichte Englands*, 1881.] J. B.

COBDEN, RICHARD, born 1804, died 1865. In 1841, being already a well-known and vigorous writer on public questions as well as an active advocate of free trade, he entered parliament, having contested Stockport, the borough which first returned him, in 1837. In 1857 he was not returned. In 1859 he was returned, while absent in America, for Rochdale, and sat for this constituency till his death. In these pages it is impossible to enter into the details of his public life.

Cobden was supposed, especially by those who did not know him, to be a mere advocate of *laissez faire*; and the school which he was reputed to have founded was nicknamed the Manchester school, chiefly by Germans, and especially by German socialists. He might have been excused if he set great store on the liberation of industry from fiscal absurdities and shackles, and thought that the best service government could do to society was to let it alone, for he had abundant experience of the mischief which the meddlesomeness of government does. But he was far too wise and experienced a man to be satisfied with mere negations, and there were few persons who interpreted the constructive side of politics with more acuteness and more perseverance. Perhaps one of the most obvious illustrations of this statement, made by the writer who probably knew him more intimately than any other person, was his negotiation of the commercial treaty with France. A commercial treaty is in direct antagonism to *laissez faire*, and at the time was criticised on this ground. Similar to this was his attitude on national education, on which he entertained opinions which have not yet been accepted, though the country is manifestly bent on accepting them in the end. His views on foreign politics too, and especially the politics of

trade, are gaining ground among the most thoughtful and intelligent public men. Cobden always refused public office, mainly owing to his antipathy to a statesman who was then in the ascendant. J. T. B.

[In this reference the notice of Cobden's sensitiveness preserved by Bagehot is interesting. Bagehot remarks in his vivid sketch of Cobden and his work: "He said at Drury Lane Theatre, in tones of feeling, almost of passion, curiously contrasting with the ordinary coolness of his nature, 'I could not serve with Sir Robert Peel.'" Bagehot's *Biographical Studies*, 1881, p. 336.]

Cobden's early life was in many ways a fit training for his later career; he passed from his father's farm at Dunford near Midhurst in Sussex to a London warehouse, and became traveller for his firm; in 1832 he began business in Manchester on his own account, and his cotton printing works at Manchester and Salden brought him the wealth which enabled him to conduct the long campaign against the corn laws.

Cobden is associated with three great political movements, the first for the repeal of protective duties, especially the repeal of the corn laws, the second against wars and military expenditure, and the third in favour of commercial treaties. The two first of these were parts of a comprehensive but simple political programme, which he held consistently through life. Like his friend Bright, he looked at political questions with the eyes of a man of business, and without much (if any) respect for tradition. In two early pamphlets, *England, Ireland, and America* (1835), and *Russia* (1836), he gave his ideas to the world substantially in the shape which they ever afterwards retained in his mind, though the necessity of negotiating commercial treaties seems to have been recognised by him only after the force of England's example had proved evidently insufficient to convert other nations to free trade. The general spirit of his whole policy is well expressed in the motto quoted by himself (in *England, Ireland, and America*) from George Washington:—"The great rule of conduct in regard to foreign nations is, in extending our commercial relations, to have, with them, as little political connection as possible." We, he contends, have no commission to administer justice to the whole world; and our interference will do more harm than good. We must set our own house in order and provide for our own people first. Further, if we are to pay our great national debt we must have a larger population and a larger trade; and, if we are to have these we must throw off our feudal traditions and our habits of excessive military and civil expenditure, and above all our protective duties. After the repeal of the corn laws, Cobden's opposition to all indirect taxation became more, and not less, pronounced; and his failure to prevent the war with Russia (1854), and the war with

China (1857) only increased his ardour in preaching a policy of what has been, not very happily, called non-intervention, or, not truly, peace at any price. His efforts to secure commercial treaties have been sometimes supposed inconsistent with his general principles (see Mallet's *Free Exchange*, 1891, where this objection is well rebutted). The "Manchester School" of politicians has ceased to play a distinct part in our parliamentary life, partly no doubt because its programme was inadequate to the problems of the new era, and largely also because many of its most important principles from being paradoxes have become truisms.

Besides the "Cobden Club," the Financial Reform Association, advocating direct taxation and the abolition of all taxation of goods, may be considered to represent his disciples. In matters of economic theory he drew his inspiration from Adam Smith; and, though he added little or nothing of his own, he had a remarkable power of making clear to a popular audience the several steps of an economical argument. As Bagehot said of him, Cobden "was not the discoverer of the free-trade principle. He did not first find out that the corn laws were bad laws. But he was the most effectual of those who discovered how the corn laws were to be repealed, how free trade was to change from a doctrine of the 'Wealth of Nations' into a principle of tariffs and a fact of real life" (Bagehot's *Biographical Studies*, 1881, p. 337). His association with Bastiat was of first-rate importance for the cause of repeal, but it has induced too many of his followers to adopt the economics of Bastiat as a whole (see e.g. Mallet's *Free Exchange*, p. 23, "without Bastiat, Cobden's policy would not have been elaborated into a system"). The economical writings of Perronet Thompson had an influence on Cobden of which he gave practical recognition by editing them for the League.

[*The political writings of Richard Cobden, with an introduction by Sir Louis Mallet, C.B.* (1878). This includes the pamphlets of 1835 and 1836 above mentioned, the four later pamphlets (1) "1793 and 1853" (2) "How wars are got up in India" (3) "What next, and next?" (4) "The Three Panics," and letter on "Rights of Belligerents."—*Speeches on Questions of Public Policy* (ed. John Bright and J. E. Thorold Rogers), new ed. 1878.—Translation of the treatise of M. COCHUT, PIERRE ANDRÉ, who was born at

Paris 1807, and died there 1890, was from 1836 to 1869 one of the most laborious and valued contributors to the *Revue des deux Mondes*. His style was brilliant, his mind firm and independent. His articles were much valued, particularly those on Algeria. The *Rapport général sur l'Algérie*, which was altogether his work, was about to be distributed officially to the chambers at the time when the revolution of 1848 broke out. It was then that he published *Les associations ouvrières* (1 vol. in 8vo, 1851), a work which is still not out of date. Soon after appeared, *Law, son système et son époque* (1 vol. in 18mo, 1853) which, while brilliant in style, shows itself to be the work of an economist and a financier of the best school. Long a contributor to the *National*, he wrote afterwards in *Le Temps*. Questions of price and money occupied his attention much, and his opinion in these matters carried great authority. From 1870 to 1885 he was a director of the *Mont de Piété* at Paris, a post which had been offered him as far back as 1848. He was president of the *Société de Statistique de Paris*, 1888, and also vice-president from 1881 of the *Société d'économie politique*. A. C. F.

CODE NAPOLEON. Before the French Revolution there were two kinds of law in France, the *droit écrit* or written law, and the *droit coutumier* or customary law; and the latter varied so much from place to place that Voltaire said a traveller changed his law as often as he changed his post-horses. Consolidation was attempted from time to time; the most successful effort in that direction was Colbert's Ordonnance; but practically the chaos remained until, on 4th August 1789, the Constituent Assembly ordered a code common to the whole kingdom to be drawn up; but Cambacérès failed for various reasons to accomplish the task then set him. Napoléon ordered the work to be taken up; he appointed a commission, consisting of Tronchet, Bigot de Préameneu, Malleville, and Portalis to prepare a code. They did so, basing their labours largely on the then existing French legal traditions, together with the Institutes, the Pandects, the Codex, and the Epitome Juliani. The successive portions were subjected to public criticism; the suggestions of the various tribunals and *tribunaux de commerce* were invited; the *Tribunal* of the year X. then discussed the clauses, but when they had got as far as the end of part iii. of the civil code, Napoléon found them troublesome and withdrew the code, expelled the opposition, and broke up the remainder into committees which were to discuss the clauses with the *Conseil d'Etat*. This was done; and the various portions, as they successively passed the *Corps Législatif*, were separately promulgated between the years 1804 and 1810. These portions, independent of one another, are (1) the *code civil*, (2) the *code de procédure civile*, (3) the *code de com-*

merce, (4) the *code d'instruction criminelle*, and (5) the *code pénal*. This code superseded all previous legislation, and where it does not provide for every case, much is left to the equity and good sense of the judge. This, with the multiplicity of co-ordinate jurisdictions in France, has brought about considerable conflict of decisions, and as precedents have there but little binding force, there is some considerable uncertainty as to what in a doubtful case the decision may be. The brevity of the code is condemned by Savigny and Austin, the latter of whom points out that there is an absence of definition of terms and of statement of guiding principles. The result of this has been the growth of a very full literature of the commentary order. On the civil code, which treats of civil rights under the three main heads of persons, property and its modifications, and the modes of acquisition of property, the commentaries of Duranton, Troplong, Toullier, Demolombe, Sirey and Gilbert, and (German) Zachariä may be consulted. The *code de commerce* treats of commercial law under the following heads:—(1) commerce in general: traders, traders' books, partnership and companies, partition of property, stock exchanges, stockbrokers and brokers, pledges, agents and common carriers, sales and purchases, bills of exchange, promissory notes and limitation; (2) maritime commerce: ships and other vessels, seizure and sale of ships, shipowners, the captain, hiring and wages of crews, charter parties and freight, bills of lading, the freight, bottomry, insurance, average, jettison and contribution, limitations of actions, exceptions or bars to actions; (3) bankruptcies and fraudulent bankruptcies: dealing with bankruptcy, fraudulent bankruptcy, reinstatement; and (4) jurisdiction in commercial cases: the organisation of the *tribunaux de commerce*, their jurisdiction, their procedure, and the procedure in courts of appeal. With reference to the *code de commerce*, the following works may be consulted:

Napoleon Argles, *French Mercantile Law*, 1882, and references therein, pp. xvii-xxiv; Mayer's *French Code of Commerce*, 1887.—Alauzet, *Commentaires*;—and with regard to the development of French law and legal tradition, Laferrière, *Histoire du droit français*.

A. D.

CODICIL. A document executed for the purpose of modifying the directions of a will, and subject to the same requirements as to form as the will itself (see *WILL*).

E. S.

COINAGE, THE RIGHT OF. "In constitutional law the right of coining has always been held to be one of the peculiar prerogatives of the Crown, and it is a maxim of the civil law that *monetandi jus principum ossibus inhaeret*" (Jevons, *Money*, p. 65). A hard use has often been made of this prerogative. A. Smith says (*Wealth of Nations*, book i. ch. iv.) "In every country of the world, I believe, the avarice

and injustice of princes and sovereign states, abusing the confidence of their subjects, have by degrees diminished the real quantity of metal which had been originally contained in their coins." J. S. Mill has expressed himself much to the same effect (*Principles of Political Economy*, book iii. ch. vii. § 2). Governments found it their interest "to interdict all coining by private persons; indeed their guarantee was often the only one which would have been relied on, a reliance, however, which very often it ill deserved." The English standard for the gold coin has remained unchanged in fineness since 1600, and the number of grains of fine gold in the pound sterling since 1717, when Sir Isaac Newton was master of the mint. The process of coining requires to be carried on with great scientific care. See **ALLOY**; **ASSAY**; **BETTERNESS**; **BRASSAGE**; **BULLION**; **MINT**.

[W. S. Jevons, *Money*.—Lord Liverpool, *Letter to the King on the Coinage*.—F. A. Walker, *Money*.—E. Seyd, *Bullion and Foreign Exchanges*.—W. Bagehot, *A Universal Money*.—*Select Tracts on Money*, printed for the Political Economy Club, etc.]

COINAGE, DECIMAL. See **DECIMAL SYSTEM**.

COKE, ROGER (fl. 1643-1696) was the third son of Henry Coke of Thorington, by his wife Margaret, daughter and heiress of Sir Richard Lovelace of Kingsdown, Kent, and grandson of Sir Edward Coke. He was educated at the University of Cambridge, where "he became well-versed in several parts of learning, and wrote a treatise against Hobbes' *Leviathan*." His principal study for some time was mathematics, but he also took great delight in commercial questions. "Tho' in his day he had good speculative notions in trade, he was not so successful in the practice of it." He fell into distress, and the "best support he had" was an annuity of £100, which was settled upon him by his nephew. "He lived for some years within the rules of the Fleet, and died a bachelor about the 77th year of his age." In his writings Coke, erroneously assuming the accuracy of SAMUEL FORTREY'S (*q.v.*) statistics, maintained that English trade and commerce were decaying; but he made many sound suggestions for their improvement. He denounced the trading corporations, which had "the artificers at their mercy," and suggested that they should be made free to all English citizens. The Statute of Apprenticeship (see **APPRENTICESHIP, STATUTE OF**) in his view prepared materials for the Poor Law to work upon. He advocated the repeal of the laws of naturalisation and of the acts restraining the importation of Irish and Scotch cattle. The exclusive privileges of the trading companies (see **FOREIGN TRADE, REGULATION OF**), which restrained English foreign trade within narrow limits, should be abolished. The **NAVIGATION ACT** (*q.v.*) had, in his opinion, secured the monopoly

of the foreign trade of the country to a few merchants, to the detriment of the producing classes. Similar laws had been found by experience to be mischievous in their operation, and, in support of his objections, he quoted the evidence laid before the committee on trade in 1668 (v. FREE TRADE). He maintained that the free importation of raw material and of foreign manufactures should be permitted. This would lead to "plenty and cheapness" of all things needed by "the poor artificers," and to the increase of trade and commerce.

Amongst Roger Coke's works may be mentioned—1. *A Detection of the Court and State of England during the four last reigns and the interregnum, consisting of private Memoirs, etc.* . . . Also an Appendix discovering the present state of the Nation, 2 vols., London, 1694, 8vo.—2. *A Discourse of Trade, in Two Parts. The first part treats of the reason of the decay of the strength, wealth, and Trade of England. The latter of the growth and increase of the Dutch trade above the English*, London, 1670, 4to.—3. *England's Improvement. In two parts: in the former is discoursed how the Kingdom of England may be improved in strength, employment, wealth, and trade: in the latter is discoursed how the navigation of England may be increased*, London, 1675, 4to.—4. *A Treatise wherein is demonstrated that the Church and State of England are in equal danger with the trade of it: Treatise 1. Reasons of the increase of the Dutch trade: Treatise 2*, London, 1671, 4to.—5. *Reflections upon the East Indy and Royal African Companies: with animadversions concerning the naturalisation of foreigners*, London, 1695, 4to.

[Coke's *Detection*, etc., 4th ed. (1719), i. xiii.—MacCulloch's *Literature of Political Economy* (1845), 4to.—Adam Smith's *Wealth of Nations*, ed. MacCulloch, 4th ed. (1853), xxxvii. 536.—Carthew's *Hundred of Launditch*, iii. 109.—*Brit. Mus. Catalogue*.] W. A. S. H.

COLBERT, JEAN BAPTISTE, born at Rheims 1619, died at Paris 1683. The son of a wool-merchant, Colbert became one of the greatest ministers France has ever seen; he formed part of the establishment of Cardinal Mazarin from 1649 to the death (9th March 1661) of that statesman, who on his deathbed recommended him to Louis XIV. Appointed immediately, 16th March 1661, intendant of the finances, he succeeded, on the day of the arrest of Nicolas Fouquet,—5th September 1661,—to him as superintendent, directing the finances from that date, originally under cover of a financial council, afterwards, from 1666, as comptroller-general. His first step was to reduce the *TAILLE* (*q. v.*), a direct property tax; he then established a departmental office (*chambre de justice*), which carried on its operations from 1662 to 1665, and was only definitely closed in 1669, after having brought in 110 millions (say £4,400,000) to the state. After some trifling reforms, he promulgated the customs tariff of September 1664, which, establishing a more complete unity

of plan, was certainly an improvement on the preceding order of things. It might even have produced real progress had Colbert, supported as he was by Louis XIV., been more confident in his own strength, and had he abolished, as the *États généraux* of 1614 desired, all internal customs restrictions, and removed the fiscal barriers to the frontier. But beyond this there remained still to be carried out the settling of the rate of duties. Colbert's regulations, certainly severe, though preferable to those of his predecessors, were rendered more strict, first in 1667, then again in 1672, when they even were the cause of the war with Holland.

Colbert, we must admit, while he put down with laudable strictness, and even severity sometimes, financial dishonesty, was carried away by his love of system and of making regulations for the control of commerce and industry. Thus he established, 1664, the two commercial companies of the East Indies (Hindustan), and of the West Indies (America). Notwithstanding his support, and in spite of the liberality of Louis XIV., these two associations, based on monopoly, gradually sank. The first vegetated on even to the times of Law (1719), but the second died in 1674. The ordinance of 1666 on manufactures and corporations was a new manifestation, and a more regrettable one, of his tendency towards regulation. To organise an industrial movement, to sustain it by custom-house regulations, always protectionist, at times prohibitive, to create model manufactures—or at least manufactures having those pretensions, sometimes through the intervention of the state and with the money of the taxpayer (Beauvais, 1664, the Gobelins, 1667), at other times (St. Gobain, 1665) through a privileged concession; this is the whole of the economic method which goes by the name of the system of Colbert. This great minister was not, after all, systematic enough to have deserved to give the name of Colbertism to his system. His methodical mind only occupied itself with overcoming difficulties, with adopting reforms one by one, after having maturely studied the consequences, particularly the immediate consequences. Though a hard worker, energetic in character, supplying the deficiencies of ignorance through supremely good sense, Colbert was never able to rise to the level of a general idea.

His activity gradually extended itself to the shipping interest, the care of which was added, 1669, to his duties; and to the arts, which he encouraged both in France and even in other countries by presents, pensions, or payments, considerable in amount, especially when the date is considered. He founded, 1663, under the title of the *Petite Académie*, the Academy of Inscriptions and Belles-Lettres; then, 1668, the academy of the sciences. He encouraged the taste and the expenses of luxury, particularly in the way of building, in Louis XIV., and

even spent large sums on festivities in the furtherance of that economic error, *faire aller le commerce*, to "make trade go." He founded the opera in 1667. He presented Riquet—and this was more useful—with the concession of the canal to join the two seas, constructed between 1665 and 1681, by means of the subsidy voted by the states of Languedoc. The canal of Orleans (1679) was also undertaken about the same time, and the canal of Burgundy projected.

Colbert thought it his duty also to give encouragement to the growth of the population by pensions to large families—but all that he did by this was to supply misery with fresh victims. Unfortunately all this activity turned capital aside from employment in agriculture, which suffered the more under the administration of Colbert because he put hindrances on the circulation of corn by regulating both the inland and foreign trade in it.

Besides this, the passion for extravagant expense took, with Louis XIV., a development which ended by making Colbert uneasy. A more serious consequence followed. The taste for war seized the king, and Louvois, secretary of state for the war department, 1662-1691, overweighed the influence of Colbert in the mind of the king, and contributed powerfully to develop this taste, to the misery of France. A few hard words addressed by the king to Colbert completely overwhelmed him and resulted in the illness which brought him to the tomb. An honest soul, deeply attached to his country, he sought its prosperity by purely practical means. He loved his king, and favoured peace. When the condition of affairs which surrounded him is considered—the difficulties he had to overcome—the indomitable energy with which he endeavoured to institute reforms, and the perseverance he displayed in bringing them about, no doubt can exist that posterity has been right in giving him the title of the *Great Colbert*.

[The "*Lettres, instructions, et mémoires de Colbert*" were collected and published by M. Pierre Clément (1861-1873 in 7 vols. gr. in 8vo). Besides this, among other works on this great minister, there may be read: *Histoire de la vie et de l'administration de Colbert*, par Pierre Clément (1 vol. in 8vo, 1846).—*Etudes sur Colbert*, par Félix Joublean, ouvrage couronné par l'Académie des sciences morales et politiques (2 vols. in 8vo, 1856).—*Colbert et son temps*, par M. Alfred Neymarck (2 vols. in 8vo, 1877). We may quote among biographies of Colbert those of Forbonnais, Bailly, Montyon, Necker, Lemontey, Ad. Sievitz, and Jean Reynaud.] A. C. F.

COLLATERAL SECURITY. See CAUTION.

COLLATION. See SUCCESSION, SCOTLAND.

COLLECT. To obtain payment of a bill of exchange or cheque as agent for another person. An indorsement "for collection" does not transfer the property to the indorsee; it is merely an authority to encash the amount at maturity.

If the indorser becomes insolvent before maturity, the indorsee has to account for the proceeds to the estate, and cannot set them off against a debt due to him from the indorser. E. S.

COLLECTIVE GOODS include all those desirable things which are not appropriated by particular individuals to the exclusion of others, but are available to all members of the community, e.g. turnpike roads, great rivers such as the Thames, public museums, free libraries, the right to a free education. Such goods constitute a very important element of national wealth. Compare Marshall, *Principles of Economics* (2d ed.), bk. ii. ch. ii. § 4. J. N. K.

COLLECTIVISM is the theory which teaches that land and capital, or the means of production, should be the property of the whole community in order to secure effective production and equitable distribution. It is thus not a different doctrine from that which is now usually meant when the word socialism is used. "The word is new, but the idea is found in every system of radical socialism" (É. de Laveleye, *Le Socialisme Contemporain*, 3^{me} éd., 1885, p. 285). M. Paul Leroy Beaulieu, in his book *Le Collectivisme* (1884, 2^{me} éd., 1885), which is in large measure a criticism of Schäffle's *Die Quintessenz des Socialismus*, defends the neologism on the ground that it is more definite than *Socialisme*, which he understands in a large and vague sense as nearly equivalent to what is in England called state interference. The name "collectivist" was at one time appropriated by the socialists who opposed what they called the authoritative communism of Marx. BAKOUNIN (*q.v.*) declared himself "a collectivist and not a communist" at the fourth general meeting of the INTERNATIONAL (*q.v.*) in 1869 (J. Garin, *L'Anarchie et les Anarchistes*, 1885, p. 79). The whole subject will be found fully treated under SOCIALISM and ANARCHISM.

[Authorities quoted in the text.] E. C.

COLLEGIUM. This term in ancient Rome signified a corporate body composed of individuals in partnership for the pursuit of some common end. *Collegia* existed at different times for the pursuit of the most various ends, religious, social, and political, but the *collegia* of most interest to the economist were the *Collegia Artificum* and the *Collegium Mercatorum*. The free workmen in Rome from very early times were organised according to their respective trades into *collegia*. The foundation of the system is variously ascribed to Numa Pompilius and to Servius Tullius. Authorities agree, however, in fixing the original number at nine, and the extreme antiquity of the system is vouched for by the fact that among the nine was a *collegium* of workers in bronze, but none of workers in iron. Early in the 4th century B.C., a *collegium* of merchants was added to the number, and in later times the

publicani appear to have formed a collegium. There is, unfortunately, very little positive evidence as to the precise constitution and importance of these collegia. Like the medieval craft-guilds they appear to have combined a social and religious with an industrial side. It cannot be ascertained to what extent their organisation applied to the provinces; but they apparently resembled the craft-guilds in being local organisations. The collegium of the sailors, however, resembled the *Compagnonnages* (*q.v.*) in possessing local branches in the provinces. The original nine collegia of craftsmen were always exempt from the repressive legislation which was from time to time promulgated against other collegia, and they continued to exist in Italy until the Middle Ages, when the *compagnonnages* and craft-guilds were developed from them. Owing no doubt to the preponderance of slave over free labour in Rome, the collegia of workmen had little direct influence on history. They never appear to have attained an importance at all comparable with that of a Trade Union in modern times.

COLONIES.

Colonies, description of, p. 321; Colonial Policy, p. 322; Colonial Lands, p. 323; Public Debts of Colonies, p. 324; Methods of Government, p. 326; Currency in British Colonies, p. 326; Denominational Currency in, p. 328; Government of, by Companies, p. 329; Colonisation, Systems of, p. 333.

COLONIES. The definition of the term "colony" is elastic, and its use is much governed by accidental circumstances, *e.g.* Ceylon is styled a "colony," and Burmah not, because they are directed by different departments of state at home.

Modern colonies, which are those treated of here, have been founded by the nations of western Europe since the time when their energy sent them one after another in quest of profit and adventure away from the Mediterranean lands which had fallen into the power of the Mohammedans. They fall into four economic types:—(1) *Factories*, those established for trade with natives; (2) *Provinces*, for exploiting, more or less explicitly, the countries taken possession of; (3) *Plantations*, for industrial occupation through employment of capital; and (4) *Colonies proper*, for complete industrial occupation. Other than economic motives have influenced the origination of modern colonies: religious liberty sent out the Jews of Portugal to Brazil; the Puritans to New England; religious enterprise the Jesuits to Paraguay; political disaffection sent cavaliers to Barbados; social offences supplied Australia with her first colonists.

1. The *Factory* system was the earliest, and

III.

was prosecuted with great vigour by the Portuguese, who, in rivalry with Venice and Genoa, drew a chain of factories from Madeira to Japan. When Portugal fell (1580) for a time into the clutches of Spain, the Dutch stepped in and secured many of their positions; in time the French and British followed up the Dutch. The Portuguese factories were royal enterprises nominally, but were farmed out; the Dutch were purely commercial undertakings, governed by the approved methods of trade found successful in Holland, and adopting a method known in present days as limitation of output, where thought necessary. The concentration of aim upon profit proved eventually their weakness. The yielding of heavy dividends promptly and regularly can hardly be an adequate basis for great human movements such as colonisation, and a clear example of the failure of such an attempt is to be found in the brief duration of the Dutch power in Brazil, 1624-1654.

2. *Provinces.* In these the inhabitants already in possession are governed and, in most cases, made use of for industrial employment. The story of Spanish colonisation is found in the histories of Mexico and Peru. The Spaniards were misled by the idea that gold and silver were identical with wealth, and fanatical in their preference for ecclesiastical system over humanity. The end of their dominion was sudden. In thirty years the Spanish empire in the new world was gained; it lasted two hundred and fifty years; in another thirty years it fell, leaving behind but Cuba, Puerto Rico, and the Philippine Islands. Still, the Spaniard did a little for the economic development of those countries; he taught the use of horses, of ploughs, and of money. France has recently formed a new province in Africa, but its interest is mainly military, and the economical value of their rule in Tonquin and Cochin China, to either party, is at present obscure. The greatest example of the province in the history of the world is undoubtedly that agglomeration of peoples, nations, and languages called "India." The economic and the educational value of the relationship between Britain and India has continually become more and more important, as that relationship has gradually taken its legitimate form.

3. *Plantations.* This type of colony has furnished a varied and interesting chapter in the history of each of the colonising countries of western Europe. When regions entered upon were inhabited by races in primitive stages of industrial life, these were either brought into service, as in Brazil, Ceylon, and the mines of Mexico and Peru, or pushed aside, as in North America. The primary purpose of these plantations was the employment of capital, not the application of the planter's labour—which indeed the climate as a rule rendered impossible. Native labour was brought into subjection.

Y

Gaols at home were emptied of their lawful inhabitants to furnish labourers for Virginia, and the sad history of the extermination of the natives of the West Indies by the Spaniards, and the crushing of the natives of Mexico, Peru, and Brazil by Spaniards and Portuguese was marked by the most disgraceful subordination of moral principle to industrial circumstances ever practised on such a scale and in so gross a manner—the deportation and enslavement of African negroes (see *SLAVERY and SLAVE TRADE*).

This extraneous supply was resorted to on the extermination of the inhabitants of the West Indies, the proof of ineffectiveness of those of Brazil, and of the inability to domesticate the Red Indians of North America; and it has resulted in the settlement of an important fraction of the Negro race in the western hemisphere. Recent years have witnessed the development of a system of regulated voluntary migration of tropical labourers from the east to the west under the name of Coolies (see *COOLIE SYSTEM*).

In spite of the mediæval character of the Virginia or Jamaica planter in many respects, he was more the prototype of the modern agriculturalist or manufacturer in England than was the New England or Pennsylvania farmer who owned his land, employed his own capital, and with his family supplied a considerable part of the labour. And as time went on plantation-owners were only represented by "attorneys" and managers, and yet their revenues, being derived from invested capital, were always regarded as profits, not rents. What has changed is the political and social status of the labourer; but he still remains economically dependent so long as he has no capital.

4. *Colonies Proper.* England only, of all European countries has been in a position to continue to put forth vigorous reproductions of herself throughout the 18th and the 19th centuries. Since the settlement of northern Europe and the formation of the German empire, Teutonic emigration has been very extensive; but it has come too late to found its own colonies, for the simple reason that the available territory is all appropriated (see *EMIGRATION*).

All that these nationalities can do is to contribute an element to the primarily English life of the United States, and the English colonies of North America, South Africa, and Australasia. The Dutch settlement in South Africa, and the French remnants in Canada and Mauritius, show a certain persistence. A conspectus of the present situation shows a varied spectacle. Relics of four empires, Spanish, Portuguese, Dutch, and French, strew the seas; but all of them are of the factory, province, or plantation type. Nations, once European colonies, occupy the western con-

tinents from the St. Lawrence to Cape Horn, British, Spanish, or Portuguese in origin and in economic character. The British empire stands out unique in magnitude, in variety, and in promise. It shows every type in full working order. Factories flourish, as Lagos, Hong-Kong, and Singapore; provinces, as India, Burmah, Fiji; plantations, as Ceylon, Mauritius, Guiana, and the West Indies; and reproductions of the British nationality in the dominion of Canada, and the seven colonies of Australasia. Besides these, are the military, naval, and commercial out-stations of Gibraltar, Malta, Cyprus, Aden, St. Helena, Bermuda, and the Falkland Islands.

[For full accounts of the present condition of European colonies, see the list of books at the end of this article, and also "British and Foreign Colonies," Sir R. Rawson, address to Statistical Society, London, 1884.—For a continuous history, see E. J. Payne, *European Colonies*, Macmillan, London, 1877.]

COLONIAL POLICY. The economic policies which have prevailed have been applications in new fields of policies already in vogue in the home countries. To reap the advantages of the new territories either by direct acquisition of their products or by exchange at enormous profit, and to appropriate these advantages as against other European nations, was the chief aim of the attention devoted to colonies throughout, and is to some extent in active operation at this day. Holland still derives a substantial revenue from her remaining possessions, and the reiteration of the question "of what use are the colonies to us?" shows that in England economic advantage is still a prominent factor in the Englishman's care for the "empire." The chief differences in policy lay in the exact relationship of the home government to the new communities; some reserved full control, as Spain and Portugal; some reserved only partial control, and delegated considerable power to the original companies, and afterwards to the colonial governments; but all agreed in regarding them as fresh sources of supply, or fresh markets for home products. It seemed to contemporary statesmen plain common sense to provide that the colonies should be content to supply what their territory was able at once to produce, to buy and sell in the markets of the home-country alone, and not to compete with her in foreign markets. The aggregate of these restrictions, monopolies, and privileges constitutes what is usually set forth as the "colonial system," which prevailed for some three hundred years. But this system must not be considered as consisting only in these restrictions. A brief consideration of it as designed by Colbert, for example, or as nursing the young colonies of North America, shows that at its early stages the advantage was not all on

one side. If Great Britain monopolised the products of her colonies, and restricted them to herself for their purchases, this was in some important respects only confining them to their best customer and their cheapest market. And besides this, the imperial army, navy, and credit were behind them, and left them free to their industrial pursuits. But as the colonies grew stronger the necessity for fostering lessened, and the situation began to be disadvantageous. Practical protests in the way of smuggling began to shake the legal position, and the eventful year 1776 saw both the declaration of independence of the thirteen British colonies in North America, and the reasoned demonstration that restrictions were operating perniciously, in Adam Smith's criticism of the whole system. It may be said that his condemnation is based on the cessation of the idea that the colonies were property, and the substitution for this of the economic idea that we and they were concerned in the production of as much material wealth as possible, and that it was not to the advantage of either that restrictions based on "artificial" (or non-economic) relations should continue.

In the general movement towards free trade as British economic policy, the Navigation Act was modified, and eventually abolished (see FREE TRADE). The differential duties in favour of her colonies were relinquished, and the country which was the latest to apply the restrictive method strictly was the first to abandon it. The issue has been a complete dissolution of the old relationship, relaxation of control has proceeded to the bitter end, and the spectacle is now seen of colonies, not only not tied to the mother country, but setting up tariffs which put her on the same footing as every other nation—in some cases even carefully excluding her products as much as theirs. Some, indeed, are only accidentally protectionist, raising their customs duties for revenue, as South Africa and New Zealand, but two at least, Canada and Victoria, are avowedly prohibitive in their intentions. This situation has given rise to many proposals for a resumption of economic relationship by means of a commercial union of the empire, a British "Zollverein," and this constitutes the most burning question of economic colonial policy at this day. It should be noted that the various members of the United States of America form a compact union with free intercourse within, and protection against outsiders; that neither Holland nor Spain have allowed their colonies commercial independence, while France is moving towards restriction again for hers; and that the German political economist List in urging Germany to begin colonies, did so on the supposition that the old system of union rather than the new system of absolute freedom would be the basis of relationship.

The effects on the economic growth of a community of its being a "colony," depend largely upon the relative force of the national and cosmopolitan feelings. In early days of rivalry and hostility between nations, the connection was of vital importance, because people would not incur expatriation, nor would capital venture itself beyond the nation's protection.

But now what colonies secure is only some advantage in the movement of capital, not an exclusive advantage. The feeling that the Government of the empire is, somehow, behind them, that they are in some ways still under a department of state, operates with considerable effect in their favour, and is preparing the public mind for the extension of the investments of trust funds to colonial government securities. As to advantage in the movement of labour, the colonial relationship cannot be said to count for very much in the face of the preponderance of emigration from Britain and Germany and Sweden to the United States; but probably less skilled and professional labour would go to Australia were it not a part of the Empire. Looked at broadly, it may be seen that to the ex-colonies of North America, and the present colonies in Australia, there has been a movement of capital and labour which has enabled Chicago, Melbourne, and Montreal, to attain their population and opulence with a rapidity far outstripping anything known in the old world with all its inheritance of endowments and equipments for industrial development.

The effect on the home countries of having colonies was more important under the old system than now. Then they were direct sources of revenue, or monopolised spheres of trade. The increase of intercommunication through facilities in travelling, the settling down of the new free trade policy, and the rise of competitors in manufacturing industry on the continent, have brought into full view what the outer empire means for British industry to-day. We can see clearly how it has been a field for emigration, and so has assisted in the rise of wages; an outlet for capital, and so has helped to check the fall of interest and of profits; a market for manufactures, and so has called into action the law of increasing returns, and effected a cheapening of commodities in spite of the rise of wages; and a source of agricultural supply which has checked the operation of the law of diminishing returns. It has contributed largely to the development of our manufacturing powers, and has thus helped to pay back the debt which List says it owes when he bases the British empire on the capacity of Great Britain for becoming a predominantly manufacturing nation.

Some individual topics remain to be noticed.

COLONIAL LANDS. The tenure of land has

in the main been on the simple basis that the crown was possessor, and could grant lands *in perpetuum* or on leases, and in colonies which acquired responsible governments these governments have taken over the rights of the crown. The raising of revenue by the sale of land has been common, especially in order to allure immigration. Gradually a more far-sighted policy is being adopted; the colonies are ceasing to live on capital in this way. Victoria now carries the proceeds of public sale of lands to a reserve fund; New Zealand, since 1879, has reserved the whole, Tasmania about one half. An important question of policy is raised by the supposition that the colonists at any given time are, corporately, the possessors of the lands of their territory—a supposition which, on its face, is barely reasonable for Victoria with a population of a million in a region larger than England and Wales, and incongruously absurd when the 50,000 people at present in Western Australia lay claim to a third of the Australian continent. The importance of this to the mother-country lies in the consequent claim of the colonists to restrict farther emigration at their discretion.

THE PUBLIC DEBTS OF THE COLONIES. The colonies have borrowed capital, as corporations, to the extent of something like 250 millions at present outstanding. But exception is taken, and with justice, to this being regarded as analogous to the national debts of European countries rather than to the debts of traders who have legitimately borrowed for use as capital. The chief portions of the national debts of the continental nations, of Britain, and even of the United States, have been borrowed for the expenses of war; the chief portions of these colonial government debts have been borrowed for public works, especially railways. The interest on the debts is largely provided by the receipts from these public works, and from this source much of the debts themselves will gradually be paid off. It is maintained by some, but denied by others, that New Zealand colony has been too sanguine, and has drawn somewhat in excess of what is easily repaid, but only because it has constructed more public works than the colony has yet proved able to make remunerative.

[See papers by Sir F. Dillon Bell, "Indebtedness of the Australian Colonies in relation to their Resources," with discussion, *Roy. Col. Inst. Proceedings*, vol. xiv. thereon; and by H. F. Billingham, "Colonial Indebtedness," *Journal of Inst. of Bankers*, March 1889, and discussion.—W. Westgarth, "Australasian Public Finance," *Colonies and India*, March 27, and discussion, April 3, 1889. The first principles of this subject are well discussed by Dr. Sidgwick in the third book of his *Political Economy*.]

The rate of interest in the colonies has proved a clear index of their growth, of the increase of confidence in their stability and future, and of

the security of their commercial connection with the home country whether the political continues or not. Loans to private borrowers used to range at fancy rates until the formation of joint-stock companies in England with boards of directors composed, partly at least, of well-known Englishmen. Thirty years ago government loans were at 6 per cent, and even then taken only at a discount, but now the $3\frac{1}{2}$ per cent of some colonies are at a premium, and Canada has a 3 per cent loan, while the Australian colonies are being advised severally to consolidate their loans at that figure. The "inscribing" of stock, permitting the amount to stand in the names of individuals, has attracted investors to whom changes of investment are objectionable, who yet wish not to tie up their savings rigidly; the lengthening of the periods for which the loans are issued has operated in the same direction. The recent conversion of the 3 per cents in England, the tendency towards 3 per cents of municipal corporations in the United Kingdom, supervening on a distaste for foreign investments, all tend to facilitate the flow of capital to the colonies and to bring the rate of 3 per cent almost within sight of most of them for their government borrowings.

[See paper in *Proceedings of Roy. Col. Inst.*, vol. ix., by Dr. J. Forbes Watson, "Character of England's Colonial and Indian Trade contrasted with her Foreign Trade."]

TRADE AND THE FLAG.—This is a figurative expression for the connection between commercial intercourse and political union. Much argument is used and masses of statistics have been compiled on both sides of the question, which is, indeed, of very great interest and importance.

To those who regard the political connection as effective in the commercial sphere, it is of extreme importance that the political connection should be retained, and strengthened, if need be, by judicious improvements; this is the primary consideration with many of those engaged in the Imperial Federation propaganda, though not a plank in their official platform.

Those who think that purely economic considerations are now—perhaps ought to be always—adequately powerful to guide peoples in the pursuit of material well-being, regard lightly the continuance of political ties, especially when so attenuated as those between the English-speaking countries and the mother country have become. They hold that natural propensities are self-acting, and will operate in keeping up a close commercial relationship, and that government relations are either worthless because quite unnecessary, or pernicious because distorting the natural procedure.

It is evident that the influence of statistics upon this discussion is limited; but the federationists can certainly at present point out some striking figures, such as Great Britain's exports to

France being 16s. a head of French population, when those to Australia are 196s.; and U.S.A., English-speaking but outside the flag, 15s., to Canada's 45s. But the opponent replies, (1) that this trade is due to the large loan operations: and the question then resolves itself, so far, into the fundamental question of the nobility of capital and labour, is this helped or hindered by the political connection? and (2) that the Canadian tariff is not so hostile,—but this may be one consequence of the flag.

[See Forster, Art. in *Nineteenth Century*, Feb. 1885, and the publications of the Imp. Fed. League generally, and on the other side Sir T. Farrer, *Free Trade versus Fair Trade*, 4th edition, 1887, and the publications of the Cobden Club. The subject, however, is not to be discussed as between protectionists and free-traders, as the chief men on both sides claim to be the latter. The imperial unionists are reinforced, however, by the free-traders and by the supporters of national economics; see S. S. Lloyd's translation of List.]

A problem of growing interest is the claim of the colonists to consider themselves as owing no effective allegiance to the mother country. The elaborate tariffs, already mentioned, form the backbone of the problem. There are also the questions of the right of the colonists at any given time to stop farther immigration from Britain or elsewhere into lands which British policy has secured from possession by other nations, and the British navy has secured from physical aggression; and the right of the colonists of the day to throw possible embarrassment on the future development of the colonies, and their utility to the mother country by injudicious allotments of the land of the colony, and in disregard of the fact that the inhabitants of Great Britain and Ireland pay interest on a vast debt partly acquired in maintaining the sovereignty of the seas which has kept France and Germany out of Australia, while the colonists are under no liability for this debt. New effects of economic conditions upon social and political organisation will present themselves in some of our colonies. For example, Victoria is a state in which labour more or less skilled, and guided by higher average of intelligence than in Europe, is the prime political power; fixed property and even movable capital being secondary in influence. The interest that depends on uncertainty will not be wanting to political economy in view of these new phenomena.

Colonial policy as regards this country is far from having arrived at the stable position which seemed promised by the steady displacement of the old system during the first three-quarters of this century. The removal one by one of the restrictions on colonial trade by Mr. Huskisson between 1814 and 1825, the abandonment of differential duties, and of the Navigation Act, 1850, seemed to point to an era of complete freedom. But the gradual adoption of protectionist policy by several important colonies

has reversed the position by placing barriers, which oppose Great Britain most, because in freedom it is her trade which would naturally be the largest. And so the colonies are drawn into the vortex of the great protection *versus* free-trade agitation. Two parties aim at a new colonial policy: one bases its recommendations on the conception of national economies in preference to cosmopolitan; the other, on the greater amount of real "freedom" which, under present circumstances, would result from freedom within this vast empire of 300 million people, though combined with protection against outside protectionist nations. The means of reaching their goal is the same for both parties, a commercial union of the empire. The opposition has also two parties—the free-traders who prefer the amount of free trade at present in force, with hope that it will by its own virtue continually increase, and so break down barriers both colonial and foreign; and the colonists who severally place their own colonies in the front of their schemes, and are content to be protectionist for their own reasons. On each side, therefore, there is a band of free-traders and a band of protectionists—Mr. W. E. Forster and Mr. Goschen have taken a place side by side with the disciples of List; Sir Thomas Farrer and the Cobden Club are the allies of the protectionists of Victoria and Canada. Meanwhile the bounty of nature, the extension of industrial ideas as determinants of national ambitions and national policies, and the continuous development of science and civilisation, combine to cause a rapidity of industrial progress in British colonies which exceeds all known elsewhere, except in our own ex-colonies, the United States. And in spite of obstructions, and while waiting for general agreement as to the next steps to be taken, the mother-country largely benefits by the industrial prosperity of the outer empire.

For systems on which colonies have been founded, see COLONISATION, SYSTEMS OF.

[The library of the Royal Colonial Institute contains books of reference, statistical publications, and histories, both general and special, to the number of 9500 volumes (catalogue price 2s. 6d., office of the institute), and 219 colonial journals and newspapers are regularly taken, filed for a year, and then deposited in the British Museum. *Statistical Abstracts* for the colonies are published annually by the Board of Trade, and *Returns of Trade and Navigation* monthly. For British colonies see *Historical Geography of the British Colonies*, Introduction, vols. i. ii. (others following), C. P. Lucas, Oxford.—*Official Reports on Colonial Products* (1887).—*The Colonial Office List*, published annually.—*British and Foreign Colonies*, Sir R. Rawson, Statistical Society, 1884.—*Synopsis of Tariffs and Trade of the British Empire* 1888, and *Sequel*, Sir R. Rawson, London, 1889. Articles in the *Proceedings of the Roy. Col. Inst.*, 1874 onwards.—*The Colonies and India*, a weekly journal, London. For HISTORY: Adam Smith's ch. viii. in bk. iv.—Smith's polemic

against the colonial system is criticised by Lord Brougham in *An Inquiry into the Colonial Policy of European Powers*, 1803 (see BROUGHAM, Lord). —Merivale, *Lectures on Colonies and Colonisation*, delivered 1839-40-41, corrected edition, London, 1862. —Payne, *European Colonies*, London, 1877, and Seeley, *Expansion of England*, London, 1882. —Dilke, *Problems of Greater Britain*, London, 1890. —Caldecott, *English Colonisation and Empire*, London, 1891. —These form an adequate library for the preliminary study of colonial history. The *Statistical Abstracts of the Board of Trade* and the *Statesman's Year-Books* supply some economic statistics for foreign countries, revised annually.

A. C.

METHODS OF GOVERNMENT. A colony (Lat. *Colonia*; *colere* to till, to cultivate) may be defined as distant possessions or dependencies of a country; more particularly the word signifies communities of settlers in a new or a

foreign country politically dependent on a parent state. Colonies are lawfully acquired by a country in respect of other states either by title of occupancy, or of cession, or of prescription. As to the rules of international law relating to the acquisition of colonies and the disputes which have arisen on the subject, see Hall's *Int. Law*, pt. ii. ch. 2.

According to our municipal law English subjects who occupy a new country carry our common law with them, as far as it is applicable to their circumstances; and the crown, apart from parliament, has no legislative power over them. On the other hand countries acquired by conquest or cession, called crown colonies, retain their own laws till they are altered, and are subject to the absolute legislative control of the crown, except in so far as parliament interferes with the prerogative of the crown in this respect, for over all our colonies and dependencies, however acquired, parliament has supreme legislative authority (cp. Dicey, *Law of the Constitution*, Lecture II.; Todd, *Parliamentary Government in the British Colonies*). Conquered and ceded countries cease to be subject to the legislation of the crown if the crown has granted them a representative legislature.

The government of each colony is carried on in the name of the crown under a governor who is appointed by the crown, and who, in our self-governing colonies is advised by ministers responsible to the legislature, like our cabinet (as to the veto of the governor in respect of colonial legislation, and other restrictions on such legislation, see Dicey, *op. cit.* Lecture III.) The legal supremacy of the imperial parliament over the colonies is only exercised in cases which do not involve any encroachment on the province of colonial self-government.

British dependencies may be either directly under the government of the crown or they may be under the immediate government of a chartered company, such as the old East India Company and Hudson Bay Company, or the present South African Company. When the East India Company was abolished, and India was brought under the direct control of the crown, the control of the government was not assigned to the colonial secretary, but to a special secretary of state for India. Hence India is not styled a colony.

E. A. W.

CURRENCY IN BRITISH COLONIES. In theory British currency followed the British flag to the New World "plantations," which were the beginning of our colonial empire. In practice, however, it was only the denomination of sterling, and not the sterling coin, which followed the first settlers. With new countries to develop, they required from the mother country not coin, but commodities in exchange for the produce they shipped home. Barter was the common mode of conducting the internal exchanges, —tobacco,

sugar, rum, indigo, wampum, skins, and timber, forming the more usual media. It was not until, with increased production, trade sprang up between some of the British colonies and the Spanish Islands and the Spanish Main, that metallic money began to flow in. This money was Spanish silver (the real and its multiples up to the "piece of eight" reals, see DOLLAR), which the colonists rated in denomination of sterling at arbitrary prices, the dominant rating of the first half of the 17th century being 4s. for the piece of eight, based on the popular currency (Barbados, Bermudas, Jamaica) of the real as a "Spanish sixpence." Clipping and competitive raisings of the local ratings of Spanish silver in the several colonies led, soon after 1650, as a rule, to the 5s.-rating of the piece of eight, which was familiar in England before that date, and which is preserved to the present day as the basis of "Halifax currency"; whilst, by the close of the 17th century a 6s.-rating was partially established both on the mainland and in some of the West India Islands. Meantime, other colonies had adopted the accepted silver-parity of 4s. 6d. for the piece of eight, and in 1652 New England had struck the silver "pine-tree coinage" (1s., 6d., 3d., 2d.) for its own use. Shortly after 1700 complaints of the evils of colonial currency began to pour in on the Board of Trade and Plantations, and in 1704 a royal proclamation was issued fixing the maximum rating of a piece of eight at 6s.-"currency" with other silver coins proportionately rated for concurrent circulation. Thus arose "proclamation money," i.e. the colonial rating of silver coins at a third above their accepted sterling value. As owing to the liberty that trading men will always take in their own bargains"), the act 6 Anne, cap. 30 was passed, making it felony to pay or receive the specified silver coins above proclamation rates. The result was entirely unexpected, for (1) the West Indian colonies evaded the act by conventionally overrating the gold coins of Spain (see DOUBLOON), and so passing in practice to a gold standard; whilst (2) the mainland colonies (now the United States) issued inconvertible and unsecured paper money in profligate profusion. The gold standard persisted in the West Indies into the present century; but on the mainland the standard coin continued to be the silver Spanish dollar. In 1739 and 1740, it should be added, the question of colonial currency engaged the attention of parliament, but no practical results followed.

In the years round 1800 the colonial empire of Great Britain, whilst it was diminished by the loss of the United States, was increased by the settlement of Australia, by the gain of the Cape, Ceylon, and British Guiana from the Dutch, and by the capture of Mauritius, Malta,

and some additional West Indian Islands from the French. And, further, the decade from 1810 to 1820 witnessed two important changes in the Spanish and British monetary systems. For (1) Spain lost the American colonies from which came the supplies of bullion which had made the Spanish dollar the universal coin for some three centuries; and (2) in 1816 the United Kingdom adopted gold as the sole measure of value, reducing silver coins to the subsidiary position of mere tokens. The now bewildering complexities of the colonial currency systems, the stoppage of the supply of the Spanish dollar, and the novel experience of retaining silver in circulation at home, led the imperial government, after striking rix-dollars (worth 1s. 6d.) for Ceylon, guilders (worth about 1s.) for British Guiana, and "anchor money" equivalent to $\frac{1}{2}$, $\frac{1}{3}$, $\frac{1}{4}$, and $\frac{1}{8}$ of a Spanish dollar for Mauritius and the West Indies, to pass an order in council and proclamation on 28d March 1825, for the purpose of introducing British silver and copper coins into general circulation throughout the colonies. Apart from the fact that tokens representing the standard gold sovereign were wholly unsuited to silver-using colonies such as Ceylon and Mauritius, there was the fundamental error in the legislation of 1825 that the Spanish dollar, then worth 4s. 2d. sterling, was rated at 4s. 4d. for concurrent circulation with sterling coins. And, further, no account was taken of the fact that, following the monetary system of Spain, most of the colonies regarded the gold doubloon (sterling value 64s.) as the equivalent of sixteen silver dollars. Consequently British silver was undervalued some 3 per cent as against the dollar, and a further 5 per cent as against the doubloon, with the natural result that the scheme of 1825 was abortive. Taught by experience, the imperial government in 1838 revoked the legislation of 1825, so far as respected the colonies "in America and in the West Indies," and ordained that throughout the West Indies the dollar and doubloon should be rated at 4s. 2d. and 64s. respectively, for concurrent circulation with sterling coins. No limit was placed on the tender of the doubloon, the dollar, or British silver. Consequently, though in the following years the several West Indian Islands formally passed acts assimilating their currency to that of the United Kingdom, the gold sovereign has been unable to circulate in competition with the shilling, and the doubloon has been driven out. The history of currency in the West Indies may here be completed by stating that, when in 1876 the gold-price of silver made it profitable to re-introduce the then practically unknown dollar, acts were forthwith passed demonetising that coin, and leaving the field to British silver coin, and the notes of the Colonial Bank. The exceptions

are (1) the Bahamas, where, by a popular—but not legal—over-valuation of the gold U.S. dollar at 4s. 2d., the practical standard is the gold currency of the United States, with British silver in subsidiary circulation, and (2) British Honduras, where in 1886 the silver dollar of Honduras was made the legal standard. At various times endeavours have been made to induce the West Indies to impose a limit on the legal tender of token silver; but local opinion is not ripe for this reform.

In other colonies the history of currency has no unity except in the principle that, since 1838, “currency areas” have been recognised, e.g. Ceylon and Mauritius have been allowed to adopt as their standard the Indian rupee, which dominates the “currency area” in which they are included by virtue of trade-relations, etc.; the currency of Spain has been adopted for Gibraltar; in Hong Kong and the Straits Settlements the Mexican dollar (see DOLLAR) has been established as the proper standard for colonies trading with silver-using China, which recognises no coin but the Mexican dollar; and, lastly and chiefly, Canada has adopted the gold currency of the neighbouring United States, a weight of fine gold, which is the exact equivalent of the U.S. gold dollar, being the standard of value. Newfoundland stands alone in having a standard (gold) coin peculiar to itself, viz. the two-dollar pieces struck at the British mint. But numerous colonies (Canada, Ceylon, Mauritius, Hong Kong, the Straits, etc.) possess tokens of their own. In concluding this brief survey of the history of metallic currency in the British colonies, the most important matter of all remains to be noted, viz. the discovery of gold in Australia in 1850, and the subsequent establishment of the Sydney and Melbourne branches of the Royal Mint in 1853 and 1866 respectively, for the coinage of sovereigns and half-sovereigns (only), which are now legal tender equally with the coins struck at the London mint.

As regards paper currency, space forbids more than the brief mention that, except in the American colonies, there was practically no paper money in circulation in the British colonies before this century; that at the Cape and in Ceylon and British Guiana we inherited a *damnosa hereditas* of inconvertible paper, which under British mismanagement increased in volume, and drove out coin in the first forty years of this century; that during the same period Jamaica and Prince Edward Island debased their currency in a similar fashion; that in Ceylon and Mauritius government note-issues have been established, which are fully secured, and have at least one-third of the reserve in coin; that the modern policy appears to be to ensure (always in the case of new issues, and as far as possible in the case of existing issues) the two essentials of security

and convertibility, leaving it open whether the issue shall be by the government or by a bank. But much of the paper which circulates in the British colonies is not adequately secured.

The following is a classified list of the colonies as regards currency:—

I. STERLING STANDARD.

- (a) With 40s. limit on silver:
Australasia, the Cape, Natal, British Bechuanaland, Fiji, St. Helena.
- (b) With a £5 limit:
Malta.
- (c) With no limit:
West India Islands, British Guiana, West African Colonies, Falkland Islands.

II. NON-STERLING STANDARD.

- | | | |
|---------|---|---|
| Gold. | { | <ul style="list-style-type: none"> (a) U.S. gold dollar:
The dominion of Canada (sovereign legal tender at \$4.66). (b) Newfoundland gold dollar:
Newfoundland (eagle and sovereign legal tender). (c) Spanish (Latin Union) “bimetallic” standard:
Gibraltar. |
| Silver. | { | <ul style="list-style-type: none"> (d) Mexican silver dollar:
Hong Kong, the Straits Settlements, Labuan, British North Borneo. (e) Indian rupee:
India, Mauritius and Ceylon. (f) Honduras dollar:
British Honduras. |

[*The Currency of the British Colonies*, anon., London, 1848.—*Early Coins of America*, Crosby, Boston, 1878.—*Conférence Monétaire Internationale de 1878*, Paris, 1878.—*The Money of the British Empire*, by Mr. A. Leslie Probyn in Vol. XXI. of the *Proceedings of the Royal Colonial Institute*, 1890.—*Coins of British Possessions and Colonies*, Atkins, London, 1889.—The acts of the several colonies, colonial histories, and pamphlets of the last and present century, dealing with currency in individual colonies, and, particularly, the valuable MSS. in the record office.] R. C.

DENOMINATIONAL CURRENCY. In connection with colonial currency the term **DENOMINATIONAL CURRENCY** requires explanation. It has been used by writers of repute; but it is illogical and unscientific, and it would be desirable to get rid of it. In transactions with many of the English colonies, especially the North American and West Indian colonies, even as late as the middle of the present century, the term “currency,” as opposed to “sterling,” was well known; and perhaps “currency,” in a strictly limited and almost local sense, without a defining, or rather a confusing, epithet, is the simplest name to adopt for the state of facts which we proceed to explain.

“Currency,” it will be found, implied the current use, in account, of the denominations of a standard coinage to represent values widely

varying from the standard, produced by the mis-rating of coins foreign to the standard.

The original colonists of the Americas naturally adopted in their new home the denomination of money with which they were familiar, and made it their money of account. At first their transactions were almost entirely in commodities. When coins became in request, those which came to them were foreign coins, chiefly Spanish and Portuguese (*v. CURRENCY IN BRITISH COLONIES*). They consequently attempted to adapt these coins to their familiar denominations of account, in other words, to rate them to the pound. This rating was incorrect; it varied in different colonies, and was often made worse by further attempts to correct it. Hence a pound's worth of dollars, according to local rating, was a very different thing from the number of dollars equivalent in intrinsic value to the pound sterling; and it usually fell considerably short of that equivalent, as was shown by the high rates of exchange which prevailed against the American and West Indian colonies for many years. The £ s. d. in which the colonists reckoned did not correspond in value either with those denominations in the sterling of the mother country or with similar denominations in neighbouring colonies. There thus existed a number of differing pounds of account, each of which came to be known locally as a "currency pound."

The same state of facts is not likely to be repeated except in the dependencies of a dominant country. In Ireland, during a good part of the 18th century, the moidore was the prevalent coin apart from debased half-pence and farthings, and Irish "currency" was in the same position as that of the Plantations.

C. A. H.

GOVERNMENT OF COLONIES BY COMPANIES. Adam Smith, in a passage which has been quoted with approval by at least one modern writer of authority, states that "the government of an exclusive company of merchants is perhaps the worst of all governments for any country whatever." The statement, if it were unchallenged, would stand for ever as a condemnation of all past or present projects conferring territorial sovereignty on a company. But this dictum of Adam Smith's is somewhat too sweeping and somewhat out of accord with the facts. So far as it is good, it needs elucidation.

The possession of territorial sovereignty by private individuals or companies, the subjects of some supreme government, is apparently associated with a special set of conditions. It has rarely been found except at those times and in those parts of the world in which rival nations have been actively competing for new trade or settlements. In the 17th century, when the power of Spain was broken, and English, Dutch, French, and Danes were rushing in

to share the spoil, the method which national caution dictated to the new comers was that of the chartered company; and the early history of North America, the West Indies, and Guiana is virtually the history of many such companies; the rest of South and all Central America was too secure in the hands of Spaniards and Portuguese to offer a field for rivalry. The struggle for the trade of the East was a struggle of companies. The latter half of the 18th century was a time of continual fighting; the present century has been a time of recovery and development on the lines settled by that fighting; there was no room for that rivalry in new fields which produced the privileged companies; Australia was the great addition to the world in this period, and there was no question who should colonise it. In our generation a fresh example of the theorem has arisen; Africa has been suddenly presented to us as the great prize open to all nations, and the recent efflorescence of chartered companies is the result.

The encouragement of such companies springs from the timidity or caution of governments. Companies rush in where the messenger of government fears to tread. If they succeed, the government of their country gladly supports them, and may ultimately reap the fruits of their labours; if they fail, no blame is taken by the government. If their actions prove premature or inconvenient they can be disavowed, the company being made a buffer to ease off friction or conceal the reality of some blow at a rival.

Not that acquisition of territory or the government of a new domain has been the original aim of any of these companies. In ancient and modern instances alike the profits of trade have been the guiding motive in their formation. Certain arrangements for the preservation of order have been included in the charter, and formed the germs of any government which afterwards grew up. It will be found that in their essence there is no difference between the chartered company of the 17th century and that of 1890. All through the document on which they base their rights the prominent idea is the security of their business; all through the history of their operations their real anxiety is the development of their trade. The real difference between ancient and modern companies is to be found in the extent of their commercial privileges and the influence of modern conscientiousness or timidity.

It will be useful for reference, and will illustrate the activity of enterprise in the 16th and 17th centuries, to give a list, which is at least approximately complete, of the numerous companies which obtained charters for exclusive trade in nearly all the known quarters of the globe previous to the 19th century.

The Merchant Adventurers' Company appear to have been the first body of men from any

nation who obtained a charter (dated in 1564) for foreign trade. The Muscovy Company was probably next, and its charter is quoted as a precedent for others, e.g. for the Company of Cathay, which received its charter in 1576. The Turkey Company was formed about the same time: the Company of Adventurers for Guinea and Benin, followed ten years later. The East India Company of London was incorporated in 1600, and thus preceded by three years the great Dutch Universal East India Company, which was destined to drive it into difficulties out of which arose the only company (commonly known as the British East India Company), which became a mighty territorial sovereign. The governor and company of Merchants of London for the discovery of the North-West Passage were incorporated at this period. And the first half of the seventeenth century was rich in companies, the majority turning their eyes towards America. The Virginia Company, the Bermuda Company, the Newfoundland Company, the first African Company (which was reconstituted four times), the Dutch West India Company, an Amazon Company, a Guiana Company which never did anything, the New England Company, the Providence Company, the Canada Company, the Massachusetts Bay Company, the Nova Scotia Company, rapidly succeeded one another. There were also the French East and West India Companies—the latter known as the Company of the Islands of America, and Canada Company formed during the same period; an English West India Company was projected but never became a reality. Most of the charters granted after 1650 are reconstitutions of old companies on a new basis, as in the case of the New Royal African Company. Charles II.'s reign teems with such new grants. The Hudson's Bay Company's first charter was granted in 1670.

An alternative method of encouraging colonisation, which must be noticed here, was the grant to a body of lords proprietors, or sometimes to a single lord. All the British Caribbee Islands were so granted in 1627; Maryland in 1669; the Bahamas and Carolina in 1670. In the case of these grants there seems to have been a clear understanding that the sovereignty rested with the crown; whereas the companies merely reserved a fixed nominal tribute to the sovereign in case he should come into their dominions; and when, as in the case of Virginia, the Bermudas, or more recently India, the Crown was required to intervene, a suspension or complete alteration of the charter was necessary.

It is well to mention the notorious South Sea Company, early in the 18th century. And the list of older companies is closed towards the end of that century by a new departure in economical history, a politico-philanthropic settlement, namely the Sierra Leone Company.

The old charters and grants which conceded their rights to the above-named companies or to lords proprietors were very much on the same lines and often almost in identical terms. Apart from arrays of names and verbiage, they were simpler documents than any recent charters. The monopoly, their *raison d'être*, the "sole privilege to pass and trade" to certain places is the leading provision in all. The necessary powers for securing the enjoyment of that privilege of trade and of the assigned territory are given, and this carried a right to exact customs duties from traders not members of the company. A governor and court of directors were usually instituted, and empowered to make laws, levy fines, and imprison. In some cases full jurisdiction of life and death is conferred, together with the power to declare martial law; in others power to make peace or war with heathen natives is also delegated; in one case (the Amazon Company) we find mention of "all customary privileges for sending ships, men, ammunition, armour, and other things." Provisions regulating the admission of members are usual, and the term of duration is commonly limited to a moderate period, though in the case of the Royal African Company it was for 1000 years. Briefly, the old charters regarded two things: 1st, the monopoly of trade; 2d, security against intruders or foreign foes. They were somewhat vague in language, and left each company to work out its own development according to circumstances. No kind of supervision by the supreme government was suggested; but in some cases a right of interference was preserved by the curious legal fiction of making the area of the grant a part of an English borough.

It was a part of the policy of the companies to induce settlers to go out to their lands, and to keep these settlers in a kind of tutelage; if this was necessary to their first success, it was also essentially the cause of their troubles. The government of a few individuals who while attracting free settlers directed everything avowedly for their own profit, and denied the right of those settlers to enjoy the fruit of their own industry, was clearly indefensible. The operations of all the companies which made something of a permanent start, such as those of Virginia and Bermuda, were very early disturbed by complaints of their monopoly. Deprivation of profits bred discontent; discontent proved difficult to handle. The domain of the company often became a scene of confusion; and discredit was cast not only on its monopoly, but upon its power to govern. It was this condition of affairs which Adam Smith reprobated; but the real root of the evil here was the exclusive privilege operating injuriously to others of the same race and ambition.

Government in the proper sense did not greatly enter into the schemes of any companies.

In most cases the disputes just referred to began so early in their history, and became so serious, that all future responsibility for the government really rested with the crown, which gradually absorbed the area of its own grant. Such was the case of the Virginia Company in 1624, some eight years after it was incorporated; the question of reform was mooted by the proposal to renew the charter for trade only, "but not for the government of the country, of which the king will himself take care." In 1631 this plan took final shape, the protests of the "adventurers" delayed it, but they could not stifle the voices of dissatisfied Englishmen; the administration of the company's territory fell in to the crown, and the company paid the charges.

In one notable instance, under a special set of circumstances, a government of remarkable power and energy grew up almost against the will of the administrators. The British East India Company started with no ambitious scheme of government; they were content to have established their factories on the coasts of the Carnatic and Bengal, provided they could oust their foreign European rivals from the trade. The intrigues of the French forced them to fight, first for their existence, afterwards for quiet possession; the flame of war once lighted was not easily quenched; the brand had fallen amongst a restless and inflammable people; the small band of the company's servants had to choose between conquest and death. The man for the hour was at hand; success followed Clive's arms, and a British company became the lords of a vast empire. In this case the climate and distance had confined the numbers of adventurers of British race to but few besides the company's own servants or licensees; the directors were hardly hampered by internal discontent, and the objects of their earlier administration were a people who expected to be ruled.

It would have been a strain on any nation to support the continued wars which for nearly half a century taxed the resources of the great East India Company; it was natural that support from the government should be asked for, and that its enjoyment should be accompanied with some measure of control. Nevertheless the government of India, even after the institution of the Board of Control in 1784, was in reality the government of the company; and that it was enlightened and careful, that it gradually handled with success the most difficult problems which confronted it, that it swept away great national evils such as child-murder and thuggism; in short, that it was conducted by a peculiarly able set of Englishmen on the lines most approved at home, will hardly be denied. The rule of the company came abruptly to an end in 1858, not so much because it was proved a failure, as because a greater crisis than ever had arisen, and the

interests of all classes in this country had become bound up with the possession of India, so that the sense of national responsibility was stronger than before.

What the East India Company did in the old world the Hudson's Bay Company partly accomplished under quieter conditions in North America, laying the foundations of two great provinces of the Canadian dominion. The same thing might have been done by many of the old companies had conditions been equal. Indeed, as Mr. Merivale suggests of the Dutch India companies, the government of a company in those days was likely to be more generally beneficial than that of a nation. There was greater regularity and economy of administration; a sharp check was kept over employés; if the court of directors itself wished to tyrannise or squeeze, it at least kept its subordinates in order. It is true that Adam Smith draws an exactly opposite picture; but it will be admitted by all who read history fairly that this great man was blinded by his hatred of monopolies of all kinds, and failed to give credit even where credit was due.

The weak point of a company's government was apt to be in its external relations. On the one hand was the fear of embroiling itself and its nation; on the other the reluctance to throw away money. This is excellently illustrated by the later history of the Dutch West India Company in Demerara and Essequibo. The Spaniards were constantly encroaching without warrant on the limits of the Dutch colony; the Dutch governors were eager to drive them off once for all; but the company, partly actuated by its anxiety not to cause a national breach, partly avowing the need of economy, declined to take a step which might have saved endless trouble afterwards.

The fact is that to govern with capacity a company must first be rich. It is chiefly this which Mr. Merivale has in mind when he states that the prosperity of companies declined as soon as they substituted empire for trade. Sovereignty brought large establishments and lavish expenditure. Because the means failed it is not a fair inference that the administration of trading companies is inherently rotten. The monopoly of the old companies produced factitious prosperity; this led them on to extravagance; and in but few cases could they withstand the simultaneous undermining of their monopoly and the unexpected strain of their own engagements.

The Sierra Leone Company at the beginning of this century is hardly a fair example of the trading company. Its operations were mixed up with philanthropic interference, which is proverbially unbusiness-like. And after all, its government was hardly less successful than that of the West African colonies under the British crown.

The Sierra Leone Company was the last of the

older attempts to make a trading company self-administering. The charter of the Falkland Islands Company was purely a trading charter. A colonial government had been established before Mr. Lafone obtained his grant. No positive monopoly was granted by the charter; the company was empowered to carry on operations for taming wild cattle and breeding stock, for establishing whale and seal fisheries, to enter into any sort of trade with the islands generally, and to contract for the performance of any services either to the government or individuals. These objects were not such as to demand a charter, the only practical aim of which appears to have been to give prestige; the effect, however, has been to create a monopoly in that distant colony which is bitterly assailed by the few independent islanders.

It would not be right to omit all mention of the Sombrero Phosphates Company, holding the island of Sombrero in the West Indies under a lease which makes the lessees responsible for the maintenance of order amongst their employés and any other inhabitants, and so far creates a small dependent government.

But broadly speaking, except that the East India Company lived on, ever approximating to state government, it may be said that colonisation by chartered companies dropped into abeyance in the 18th century, and that after a lapse of nearly a hundred years the system suddenly burst again into life in the charter of the British North Borneo Company.

This charter was the first, and the example, of the modern grants. It was the result of a number of concessions in the same district coming into the hands of one man and forming a responsibility which he could not bear alone. The revival of the idea of a chartered company was not unnatural, in view of the extent and delicacy of the interests concerned. But the precise stipulations of the new charter gave it a stamp widely different from that of the old grants.

The German New Guinea Company was the next in the field. And the Royal Niger Company, the Imperial British East Africa Company, and the British South Africa Company, all received charters on the new British model within the space of three and a half years; all three absorbing individual and competing interests which the government of Great Britain was disinclined to support. The German East African Company followed in the steps of the British Company of similar title.

Modern philanthropy and respect of human life, the natural timidity of governments, and the special caution which characterises that of Great Britain, have laid an indelible mark on the new British charters. There is, of course, no exclusive enjoyment of trade; on the contrary, monopolies are carefully prohibited; but there is the exclusive right to grant concessions

within the territory assigned, and to deal with it for the company's advantage; power is also taken for the establishment of any kind of business. At every point the control of the crown, through one of the principal secretaries of state, is jealously reserved; without reference to him no transfer of territory can be made, no dealings with native or foreign powers are final. The discouragement of all slavery and of the liquor traffic is specially enjoined; interference with native religions is forbidden; consideration of the customs of natives is required in the administration of justice.

As already suggested, it is in these precautions that the real difference between the older and modern grants lies. It is nothing more than the difference of the spirit of their age. Both contemplate the necessity of administration, and make some sort of provision for it. But in the older cases a free hand is left to the directors; in the modern every precaution is taken against collision with foreign states or oppression of native races. There is no foundation for any attempt to differentiate ancient and modern chartered companies by the extent of their administrative purpose. This has always been the creature of circumstance, and it may be that when the history of existing companies some day comes to be written, one or more may be found to have rivalled the success of the British East India Company.

A real difference in regard to method of government is found between the British and Dutch companies on one side, and the French and German companies on the other. The distinction applies alike to old and modern charters. The Britons and the Dutch are above all things traders, and traders who rely on their own resources; their charters are for trade, and the companies are left to stand or fall by themselves; intervention of the national government closes the company's rule. The French and Germans carry with them their fatherland; the imperial power must be close behind them; the sovereignty of their companies is the delegated sovereignty of the supreme government; the administration of justice and certain executive functions rest directly with the government; and all foreign relations are controlled by it. The German New Guinea Company and the German East African Company are veiled forms of the German government, hence the warships and bombardments which mark their operations.

The obvious result is that the progress of the aided companies is at first more obtrusive; avowed dominion by the national government must come more rapidly; and, in the case of nations like the Germans and French whose policy is exclusive, this involves restrictions affecting the world. On the other hand the real grip of a district, which is the foundation of good administration, may never come by this

method. By the British plan the ground is carefully prepared for empire first; if the project is successful, there is little question that colonial government will take firm root, when its time comes at last.

If we have dealt chiefly with British companies it is that in British hands the chartered company has been most widely and successfully used. In its present form the British chartered company is shorn of every objectionable feature. It may be a great pioneer of trade and confer lasting blessing on unopened districts. It may keep open tracts of land which would otherwise be closed by a selfish policy. But the government which encourages fresh companies must be prepared eventually to administer a new territory; and the real question of policy is brought down to this—whether, while there is yet room for expansion, a living empire must be a growing empire.

[The *locus classicus* on the subject of government by companies is Adam Smith's excellent chapter bk. iv. ch. vii. and esp. pt. ii., where his distinction between "regulated" and "joint-stock" companies is worth noting. See also Sir G. C. Lewis's essay on *The Government of Dependencies*, circa p. 113.—Merivale's *Colonisation and Colonies*, pp. 50-60 (ed. 1861).—*The Calendars of State Papers (Colonial)* (1574-1674, 3 vols.) are a mine of history, and Mr. Sainsbury's prefaces are useful.—Sir W. Kaye's *History of the East India Company* is one amongst many works on that subject. A sketch of the Dutch West India Company is found in Motley's *United Netherlands*. References to other special companies are scattered; but for the Hudson's Bay Company consult Parl. Paper 547 of 1842; and for recent charters the *London Gazette* of 8th November 1881 (British N. Borneo), 13th July 1886 (Royal Niger), 7th September 1888 (Imp. Brit. E. African Co.), 20th December 1889 (Brit. S. African Co.)]

[See AFRICAN COMPANIES, EARLY; AFRICAN COMPANIES, RECENT; EAST INDIA COMPANIES, BRITISH.] C. A. H.

SYSTEMS OF COLONISATION. In its economic or industrial aspect, colonisation must be deemed the outcome of modern necessities and the offspring of modern instincts. The settlement of colonies took place, indeed, in early times, but it proceeded usually in ways and from causes other than those recognised by modern systems. With the Phœnicians, colonies were little else than trading stations; to the Greeks they represented more, being founded oftentimes in response to political exigencies; the Roman colonies, united to the mother state by a common bond of citizenship, while at times little more than military settlements, were at times again a means of relieving distress or discontent. Nor was there any sign of conscious colonisation even at the close of the Middle Ages, when the discovery of America threw open a new world to Europe. About that time two chief motives led to settlements beyond the borders of the

country or city whose citizens formed the new inhabitants. 1. The desire to form trading stations, as, for instance, in the cases of Venice and Genoa in the Mediterranean, of Spain and Portugal in the new world, and afterwards in the case of companies, such as the East India Companies. 2. The desire for adventure resulting at times in settlement. During the 16th and 17th centuries, the first of these objects met with encouragement from the new school of statesmen as Lord Burghley and Oliver Cromwell in England, Richelieu and Colbert in France. In the case of the former country, too, political conditions and love of adventure combined to add the notion of settlement to that of trade. There was, however, no conscious regulation of the new settlements with a view to their rapid industrial development. *Colonisation*, in its true sense, was unknown, whether the system adopted was proprietary or more immediately dependent on the crown. The growth of a system of colonisation may be best traced in the history of the British colonies. Here, indeed, relations of the colony to the mother country were fully recognised, especially by such a measure as the NAVIGATION ACT 1652 (*q.v.*) The system thus inaugurated was that of political freedom, but commercial restraint for the advantage of the mother country. An attempt to interfere with the former led to the loss of the American colonies, and in consequence to a change of policy. The colonies were governed more from home, but every encouragement was offered to their commercial development, as the effect of the trade restrictions (differential) imposed on both sides was to confine colonial products to the most important market in the world, though this might have the effect of limiting the sources from which England might derive her supplies of raw material. Thus matters stood at the beginning of the 19th century. In reality there were four points on which a decision had to be arrived at:—1. The position of the colony as an outlet for the rapidly increasing home population. 2. The settlement of this population so as to promote best the development of the colony. 3. In consequence, the political relations of the two countries. 4. The commercial relations of the two countries.

The first two of these are those which relate most closely to the subject of colonisation, the others being in part their consequence, and from their nature involving a consideration of general administrative and commercial policy.

The colonies were supplied with immigrants from home, but these being in general either convicts or paupers (*cp.* Wakefield, *Art of Colonisation*, Letter xxi.) were of doubtful advantage. In the next place, the new population, enticed by the offer of free grants of land, spread themselves over a larger surface than they had capital to cultivate. In 1829 the

system of free grants was opposed by Edward Gibbon Wakefield (*Letter from Sydney*, by R. Gouger) and in 1830 the Colonisation Society was formed. Its members attacked the system of transportation, and their accusations were confirmed by the report of the select committee in 1838, soon followed by the cessation of transportation.

Meantime the efforts of Wakefield were concentrated on the second of the two questions. Labour was needed on the land. It must be restrained from undue diffusion. When the need of labour had been felt at a much earlier date in the American colonies it had been met, in the southern states at least, by the employment of slaves. This remedy was out of the question. Now Wakefield proposed to cope with the matter by a reconstruction of the system according to which the public lands were disposed of. Free grants were to be abolished and the land to be sold at a price determined according to the circumstances of the case. It was further proposed to apply the proceeds to the promotion of immigration, and also to the improvement of the means of communication (cp. *Reign of Victoria*, vol. ii. pp. 405-408). The important principle was that of the sale of land at a *sufficient* price. So far as the substitution of "sale" for "free grant" was concerned, it was adopted by the instruction of 1831, with reference to Australia (Grey, *Colonial Policy*, letter vii.), advocated in the Durham report and given full effect to by the Australian Land Act of 1842. But when it was attempted to put the plan more fully into practice, a difficulty occurred in the interpretation of the term "sufficient." This was shown in the history of the efforts of the South Australian Company (cp. Wakefield, *Art of Colonisation*, letter ix. and also despatch by Sir George Gipps, *Parl. Papers*, 1843, No. 323).

The efforts of Wakefield were in fact directed to the discovery of means whereby capital and labour might be introduced into the colony in such a manner and in such proportions as to lead to its more stable development. For the fullest accounts of his system, see *The Art of Colonisation*, by E. G. Wakefield; *Lectures on Colonisation*, by Herman Merivale; *Colonisation avec les peuples modernes*, par P. Leroy Beaulieu. The two latter works are extremely critical in nature, though perhaps the most searching criticism of all is to be found in the above-quoted despatch from Sir George Gipps.

It remains to consider the effect of colonisation on the home country. Its condition may be affected directly or indirectly—directly by the loss it sustains of population and capital, indirectly by the consequences involved in the development of a colonial trade. The question of emigration has attracted and continues still to attract a considerable amount of attention. While there must be considerable difference of

opinion as to the benefit it confers, the three following propositions may be regarded as established. 1. It cannot be a *permanent* safeguard against over-population. 2. Unless concurrent with an increase of prudence in marriage and a rise in the standard of comfort, it can ameliorate but little the condition of the working classes from whose number the emigrants are theoretically drawn. 3. It is highly beneficial in relieving the congestion which from many incidental causes has taken place in particular districts.

The exportation of capital, implying as it does the employment of such capital in circumstances more favourable than would have been the case at home, prevents the rate of interest, from falling. (For this and for its other effects see Merivale, *Colonisation*, Lecture vi.)

The development of the colonial trade which involves the same better distribution of energy, has in consequence a beneficial effect on the condition of the people in the home country (see COLONIAL POLICY).

[Works cited in text, and more particularly, H. Merivale, *Lectures on Colonisation*.—P. Leroy Beaulieu, *Colonisation chez les peuples modernes*; Roscher, *Kolonien, Kolonialpolitik und Auswanderung*.—Colonel Torrens, *Colonisation of South Australia*.] E. C. K. G.

COLQUHOUN, PATRICK (born 1745, died 1820), lord provost of Glasgow, police magistrate in London, in the course of an active life contributed to social science some thirty publications; among which may be distinguished: (1) *Treatise on the Police of the Metropolis*, 1795; (2) *Treatise on Indigence*, 1806; (3) *Treatise on the Population, Wealth, Power, and Resources of the British Empire* . . . , 1814. Mr. Giffen, in his *Growth of Capital* (p. 101), utilises Colquhoun's estimates of national wealth; and, while admitting that "many of his details are fanciful," considers that "he was most unjustly decried by M'Culloch" (*Ibid.* p. 50). Colquhoun himself confesses that his statistics are not accurate: "all that is attainable is approximating facts," he pleads. His general remarks are often sound; for instance, advocating savings banks, "The great desideratum in political economy is to lead the poor by gentle and practicable means into the way of bettering themselves." He has just views on the education of the poor (*Indigence*, ch. v.), and on the growth of the population (*Wealth, Power, and Resources*, ch. i.) On currency he is less happy (Letters to Dr. Boase, *Brit. Mus. Addit. MS.*, 29,281).

[In a *Biographical Sketch* . . . by Iarps (Colquhoun's son-in-law, Dr. Yeats) there is a catalogue of Colquhoun's publications. It does not include *Considerations on the means of affording profitable employment to the redundant population of Great Britain and Ireland*, published anonymously 1818 (Lowndes).]

F. Y. E.

COLTON, REV. CALVIN, born in Massachusetts 1789, died in Georgia 1857. At first a Presbyterian clergyman, he soon entered the ministry of the Protestant Episcopal Church. This he relinquished for journalism, and in 1852 became professor of political economy at Trinity College, Hartford, Conn. He advocated very strongly the policy of protection to home industries, and was a devoted follower of Henry Clay. He wrote works on travel, and on religious and political subjects. Among his economic works are *The Crisis of the Country*, 1840.—*The Junius Tracts*, 1843-44.—*The Rights of Labour*, New York, 1846, pp. 96; and a more extensive work, *Public Economy for the United States*, New York, 1848, pp. 536. He edited the works of Henry Clay, and in all his economic writings dwells principally upon the theme of protection.

D. R. D.

COLWELL, STEPHEN, born in Virginia 1800; entered on the practice of law in his native state; early removed to Pittsburg, and relinquished his profession to become an iron merchant in Philadelphia, where he lived the remainder of his life; died 1872. He devoted much time to the study of political economy, wrote largely for the periodicals of the day, and associated himself with the protective party. Among his more extended writings may be mentioned *The Relative Position in our Industry of Foreign Commerce, Domestic Production, and Internal Trade*, Philadelphia, 1850, 8vo, pp. 50; and an American edition of Frederick List's *National System of Political Economy*, Philadelphia, 1856, pp. 497, for which he wrote a preliminary essay, pp. lxxiv. His best known work is *The Ways and Means of Commercial Payment*, Philadelphia, 1858, in which he attempts a full analysis of the credit system, with its various modes of adjustment; he argues that a mistake has been made in previous analyses in not making a radical distinction between money of the precious metals and forms of credit; the historical inquiry into the growth of the credit system is of considerable value, and the whole work exhibits independence of thought; he did not accept the view that the quantity of money is the controlling factor in determining prices. His other writings of economic interest are, *The Claims of Labour, and their Precedence to the Claims of Free Trade*, pp. 52, 1861.—*Gold, Banks, and Taxation*, pp. 68, 1864; and *State and National Systems of Banks, Expansion of the Currency, the Advance of Gold, and the Defects of the Internal Revenue Bill of June 1864*, 8vo, 1864. At the close of the civil war in 1865 he was appointed a member of the revenue commission, and in 1866 made a valuable report on taxation. In this document Colwell's special reports are upon *The Influence of Duplication of Taxes upon American Industry*; upon *Relations of Foreign Trade to Domestic Industry and Internal*

Revenue; upon *Iron and Steel*; and upon *Wool and Woollens*. He also elsewhere made reports upon *High Prices and their Relations with Currency and Taxation*, 1866.—*Over-Importations and Relief*, 1866.—*Financial Suggestions and Remarks*, 1867, pp. 19. See *Memoir* by Henry C. Carey, Philadelphia, 1871, pp. 35, in which (p. 32) will be found a list of writings, thirty-two in number.

D. R. D.

COMBINATION. Combinations for the purpose of controlling the production, exchange, and distribution of wealth, have assumed so many forms that it is only possible here to give an outline of the subject—the reader being referred to other pages for a detailed examination of each class.

I. PRODUCTION. Some forms of wealth can only be produced by the assistance of large capital, and in some industries production on a large scale is distinctly economical (Mill's *Polit. Econ.*, bk. i. ch. ix.) Hence capitalists have united in various combinations recognised by law:—

(1) *Partnership*. Where two or more persons agree to combine property, labour, or skill in business, and to share the profits between them.

(2) *Company*. Where a number of persons are incorporated into a company either under act of parliament or by charter from the crown, the liability of members being either limited or unlimited (see COMPANIES).

Combinations of producers have also been formed with the object of controlling the production of some one or more commodities so as to secure if possible a monopoly of production. The following types of this method may be mentioned:—

(1) *Pools*. Where a joint committee of delegates from several producing establishments control the production (see POOLS).

(2) *Syndicates*. Where one firm or company agrees to take all the produce of other firms in the same business at fixed prices: the amount of the produce being often limited by agreement. The copper syndicate formed by the *Société Industrielle et Commerciale des Métaux de Paris* is the most famous of this class.

(3) *Trusts*. Where the stockholders in several corporations transfer their shares to trustees, who become registered in their places as owners of the stock and so obtain complete control of the management. Usually the shareholders receive trust certificates in exchange for their shares. The complete legality of such a proceeding has been maintained (*Polit. Sci. Quarterly*, Dec. 1888), but in at least one American case it has been held that a corporation whose members enter into such a trust forfeits its corporate character (see TRUSTS).

Companies are sometimes formed with the object of establishing a monopoly of production, by buying up the business of all persons engaged in the trade. The Salt Union which

has purchased many of the salt properties in England and Ireland is an example of this class.

Various forms of combinations are found to exist between sellers and buyers:—

(1) Wholesale firms are frequently bound by agreement with their customers (retail dealers) not to sell except to retail firms.

(2) Distributors or intermediate dealers, often combine to buy at a low price from producers and to sell at a high price to consumers. The milk exchange of New York bought milk at two to three and a half cents per quart and sold it as high as seven or ten cents.

(3) Combinations or agreements between seller and buyer that the latter will sell again only at a certain price are very numerous in America, though such agreements have been declared illegal.

In a separate class may be placed the combinations entered into by carrying companies either to secure if possible a monopoly of traffic or to prevent competition by agreeing on a scale of rates and charges.

[For examples of these various forms of combinations see *Report of Committee of State of New York upon Trusts*, 1888.—*Report of Committee of Canadian House of Commons on Combinations regarding manufacture or sale of Products*, 1888.—*Quarterly Journal of Economics*, 1889, Boston, vol. iii. No. 2.—*Political Science Quarterly*, 1888, New York, vol. iii. Nos. 2, 3.—Sidgwick, *Polit. Econ.*, bk. iii. ch. x., and Marshall, *Principles of Economics*, bk. v. ch. viii., discuss the theoretic aspects of monopolies.—Cournot's treatment of the abstract theory of monopoly (*Recherches*, ch. v. *Du Monopole*) has influenced most subsequent writers. Much light is thrown both on the theory and facts of the subject by the following: Hadley, *Railway Transportation*.—C. W. Baker, *Monopolies and the People*.]

II. DISTRIBUTION. In all the leading industries the employers and the employed have formed their respective associations for the protection of their own interests. The terms upon which the labourer is to give his services are not arranged by him and his employer individually, but by the respective associations to which they belong. Mill, regarding wages as paid out of capital, did not think that combinations of working men could raise wages without adding to capital; but more recent economists look on wages as a share of the produce, and admit that by combination wages may be raised (Sidgwick's *Polit. Econ.*, bk. ii. ch. x.; Marshall's *Economics of Industry*, London, 1879; and *The Principles of Economics*, 1891; Walker on *Wages*. See TRADES UNIONS).

Combinations on the part of labourers to obtain higher wages or shorter hours of labour are not illegal, but it seems that a combination of tenants to obtain a reduction of rent may, under certain circumstances, amount to an illegal conspiracy.

III. PRODUCTION AND DISTRIBUTION. In

order to avoid the conflicts that arise between employers and employed different forms of "profit sharing" have been tried with varying success, the employer agreeing to hand over to the workers, in addition to their wages, a share of the profits (see PROFIT SHARING).

IV. DISTRIBUTION AND CONSUMPTION. In order to secure to consumers the profits made by producers, various forms of co-operation have been introduced in which the capital is subscribed by the consumers. This idea has been specially successful in saving to the consumer the profits of the retail dealer by the establishment of co-operative stores, and there is a growing tendency to apply the same principle to actual production (see CO-OPERATION). J. E. C. M.

COMBINATION LAWS. The object of the series of statutes known as the combination laws was to enforce the provisions of the statutes of labourers of Edw. III. and of Elizabeth which authorised the justices in quarter sessions to fix wages. One of the first acts, 3 Hen. VI. c. 1, after reciting that the yearly confederacies of the masons tended to destroy the force of the statutes of labourers, enacted that such meetings should not be held under pain of imprisonment. In 1548 a more general statute was passed (2 & 3 Ed. VI. c. 15) which prohibited all conspiracies and covenants not to make or do their work but at a certain price, under penalty, on a third conviction, of the pillory and loss of an ear. In subsequent years the following acts relating to particular trades were passed prohibiting combinations for raising wages or reducing the hours of labour in the trade, viz. 7 Geo. I. c. 13 (journeymen tailors); 12 Geo. I. c. 34 (wool trade); 22 Geo. II. c. 27 (hatters); 17 Geo. III. c. 55 (silk weavers); and 36 Geo. III. c. 111 (paper trade).

In 1799 a general act was passed, but it was repealed and replaced in the following year by 40 Geo. III. c. 60, which prohibited all combinations for obtaining an advance in wages or lessening the hours of work. This act, says Mr. Justice Stephen (*History of the Criminal Law of England*, London, 1883, vol. iii. p. 208), "applies in the most detailed, specific, uncompromising way the principle upon which all the earlier legislation had depended. . . . I should not describe it as a system specially adapted and designed to protect freedom of trade. The only freedom for which it seems to me to have been specially solicitous is the freedom of the employers from coercion by their men."

The first attempt to modify this system of legislation was the 5 Geo. IV. c. 95, which repealed all the previous statutes so far as they related to combinations of workmen, and declared that persons joining combinations of workmen for obtaining an advance in wages or lessening the hours of labour, or for other specified purposes, should not be liable to any prosecution for

conspiracy. The act was considered to have encouraged combinations for objectionable purposes, and in the following year (1825) it was repealed and replaced by the 6 Geo. IV. c. 129. This new act, whilst it repealed the previous statutes, did not in express terms legalise combinations of workmen—the legality of such combinations was left to be dealt with by the common law—but simply rendered men liable to punishment or the use of threats, intimidation, molestation, and obstruction directed towards the attainment of the objects of trade unions. A few alterations in the act were made by 22 Vict. c. 34. The recommendations of the royal commission of 1867 on trade unions led to the repeal of the 6 Geo. IV. c. 129, and the 22 Vict. c. 34, by the 38 & 39 Vict. c. 31, and the 38 & 39 Vict. c. 32, which declared that the purposes of a trade union were not to be deemed unlawful by reason merely that they were in restraint of trade, and carefully defined what acts should be deemed criminal offences. The protection afforded by these acts was greatly diminished by the gradual extension of the common law doctrine of conspiracy, and at length, in 1875, the act was repealed and replaced by the Conspiracy and Protection Act, 38 & 39 Vict. c. 86 (see CONSPIRACY, LAW OF).

[The following writings set forth the sequence and import of these laws : G. Howell, *Handbook of the Labour Laws*.—Jevons, *State in Relation to Labour*.—J. E. Davis, *Labour and Labour Laws*.—Report on Strikes and Lockouts of 1888 by the Labour Correspondent of the Board of Trade, Parliamentary Papers, 1889, C 5809.]

J. E. C. M.

COMFORT, STANDARD OF. This expression, together with the synonymous "standard of living," has been generally employed by economists in connection with the question of POPULATION (*q.v.*) Among the "preventive remedies" of over-population described by MALTHUS (*q.v.*) in his essay is included "moral restraint," and this is defined (ch. ii.) as a "restraint from marriage from prudential motives." By this is meant the fear of losing, as the consequence of entering upon the responsibilities of the married state, the command of adequate means of subsistence. The means, which will be regarded as adequate, will vary according to the conception formed by the individual, or the class to which he or she belongs, of the elements which make up subsistence; and it is this conception which is implied in the term "standard of comfort," or "standard of living." It may, therefore, vary from age to age, from country to country, from class to class, and even from individual to individual. The term may be analysed in different ways. We may regard the constituent elements of subsistence as consisting of (1) food, (2) clothes, (3) shelter, etc.; or we may, using a cross-division, consider with

Senior (*Political Economy*, p. 36) that the range of man's desires rises in an ascending scale from (1) necessities to (2) decencies and (3) luxuries. And hence the term has sometimes been employed in a narrower, and sometimes in a wider sense. In an earlier and less advanced stage of civilisation the proportion assigned to the element of necessities in the conception formed by classes and by individuals of their standard of comfort is greater than it is at a later stage, and among these necessities the supply of food is accorded the most prominent place. And therefore the question of population has very generally been considered either solely or chiefly with reference to food, and it has also been argued by McCulloch and others that the habitual use of a cheap staple article of food by a nation may lead to inconvenience and danger, because in the event of a scarcity or famine of that food, there would be no cheaper food on which to fall back, and the standard of comfort would not permit of temporary contraction. It has been said that "you may take from an Englishman, but you cannot take from an Irishman." If a famine of wheat should occur, the Englishman could fall back on some cheaper food; but experience has shown more than once that the Irishman has nothing on which to fall back if the potato fails. But General Walker has pointed out (*Wages Question*, ch. vii.) that, so far as regards the temporary contraction of the standard of comfort, this argument does not appear to take sufficient account of the fact that there are other constituent elements of the standard besides food, and that therefore the habitual use of a cheap food may allow of greater expenditure in other directions, which may be curtailed, should food become scarce, and its price advance. A similar failure to realise the elastic comprehensiveness of the term "standard of comfort" has been shown (cp. Sidgwick's *Principles of Political Economy*, bk. i. ch. vi. § 3) to attach to another line of reasoning in which it has been introduced. Modern socialist writers (see SOCIALISM), such as Rodbertus and Lassalle, have spoken of an "iron and cruel law" of wages, which is always forcing wages down to the level of a bare subsistence. For, if they rise above this level, there is a tendency to an increase of population, and the greater competition for employment, which is consequent upon this, tends in its turn to occasion a decline of wages. This law is undoubtedly based on the conception of a standard of living or comfort, which will be maintained in such a way that, if the earnings of man and woman rise above the amount sufficient to secure this standard, population will increase, and, if they fall below, it will decrease. But the conception is often, though it is not always, interpreted by socialist writers in a narrow sense as referring to the bare necessities of life, and not more widely as

including its decencies and luxuries. It is used as if the standard of comfort were limited to physical needs, and did not comprehend moral requirements. As a matter of fact it consists of the necessities, decencies, and luxuries of life; and the desire to retain command over the possession of the two last may become more powerful even than the want of the first as a restraint on the increase of population. The nature of all three may undergo considerable change and exhibit great variety. The house, which would now be a decency in England, would have been thought a luxury two or three centuries ago. The clothes, which would be deemed extravagant to-day, except in theatrical performances, would then have been considered necessary articles of apparel. The tobacco, which is regarded as a decency in Turkey, is still perhaps a luxury in England, and the wine, which is a decency in England, is a prohibited luxury in Turkey. And so the standard of comfort varies in different ages, countries, and classes; and in the case of the lower as of the higher ranks of society it may advance from time to time. The origin of the socialist law of wages has been ascribed to RICARDO's (*q.v.*) theory of the natural price of labour, but Ricardo's own language is sufficiently elastic and comprehensive. "It is not to be understood," he says (ch. v.) "that the natural price of labour, estimated even in food and necessities, is absolutely fixed and constant. It varies at different times in the same country, and very materially differs in different countries. It essentially depends on the habits and customs of the people." And again he remarks, "The friends of humanity cannot but wish that in all countries the labouring classes should have a taste for comforts and enjoyments, and that they should be stimulated by all legal means in their exertions to procure them." The effects of the standard of comfort on the movement of population are of course not immediate; and the consequences of an alteration in it take some time to make their influence felt. And hence J. S. Mill has argued (bk. ii. ch. xiii. § 4) that, "when the object is to raise the permanent condition of a people, small means do not merely produce small effects, they produce no effect at all. Unless comfort can be made as habitual to a whole generation as indigence is now, nothing is accomplished." In a similar way General Walker has shown (*Wages Question*, ch. iv.) that, if through some sudden mischance wages sustain a serious fall, a positive "degradation" of labour may follow, and the labourer may have no power or strength to maintain his old standard of comfort without external assistance.

It should be noted that some ambiguity may arise regarding the unit selected for consideration in connection with the standard of comfort. The term may sometimes refer to

a single individual, whether male or female, and sometimes to a family as a whole. In the discussion of questions of population the conditions, which are necessary in order to maintain the requisite supply of labour, are generally present to the mind of the writer; and then the standard of comfort must be understood as referring to the family as the unit rather than the individual, for the wages of the labourers must be such as to enable them to live themselves, and to maintain their wives, and bring up their children, according to the standard of comfort, which they consider necessary for a family in their rank of life. But the earnings possibly of the wife, and possibly also of the children, may be called in to assist those of the man, and so from the point of view both of income and expenditure the family is treated as the unit. There are, however, other cases in which shorter periods of time are in view than those sufficient to allow of the standard of comfort producing its full influence on the movement of population, and then the term is often employed with reference to the individual rather than the family. An example of this may be found in the comparison made between the earnings of men and of women (cp. FEMALES AND CHILDREN, EARNINGS OF; see also DAVIES, D.)

In addition to the books mentioned above, some typical budgets of working men, showing the chief items of their expenditure, and the proportionate amounts spent on the different items, have been compiled abroad, especially by Dr. Engel and M. Le Play, and more recently in our own country by the Board of Trade.

L. L. P.

COMMANDITE, SOCIÉTÉ EN. Form of joint stock company, *Code de Commerce*, liv. i. tit. iii. §§ 23-28. The managing partners are liable without limit; the investing partners are regarded as simple lenders to the undertaking, and their liability is limited to their investment. Something equivalent (joint-stock company limited, the liability of whose directors is unlimited) is legalised by the Companies Act 1867, §§ 4-8; and it would appear desirable in the interests of careful management that investors should encourage the adoption of this form of joint-stock company.

A. D.

COMMERCE. Trade in its most extended form. "Commerce" and "trade" are words which are used almost synonymously. But commerce may be regarded as national, that is as covering commercial dealings between nations; and trade refers more distinctly to special industries and to internal mercantile intercourse. It will therefore be proper, keeping to the limits thus set down, to furnish under the head of commerce a summary of the external commercial relations of Great Britain and Ireland, of her colonies, and finally of the world. The figures, as we shall see, are not only interesting

themselves, but will serve to illustrate some economic truths as an appeal to actual fact alone is able to do. It is marvellous how the commerce of the world may almost be said to be the creation of the past seventy-five years. The close of the twenty-five years of war that followed the French Revolution found the external commerce of the world mainly confined to luxuries, wines and spirits, tobacco, tea, and so on—the rigidly protective policy of the leading nations of the earth, added to their hostility, keeping down the national interchanges to high-priced goods only.

In 1820, five years after the overthrow of the first Napoleon, the imports and exports combined (they were then "official values," or "declared values" as we have them now) see OFFICIAL AND DECLARED VALUES) of the United Kingdom were only £79,500,000, or only about £3:15s. per head of the population then existing, whereas in 1890 they reached £749,000,000, or £18:6s. per head. During the same period the commercial intercourse between Great Britain and her colonies has been almost wholly created, and amongst foreign countries the movement is upon the average very considerable. Steam carriage, the freedom from protracted wars, the growth of population, colonisation, and electricity have been the main elements in that development of commerce. In 1854 the "official values" were discarded in the imports for *computed* values and in the exports for *declared* values, and from 1871 the values of the imports have also been *declared*. The following figures give the imports and exports at intervals since 1854:—

United Kingdom.	Imports.	Exports.		
		United Kingdom Produce.	Foreign, etc., Produce.	Total Exports.
1855	£113,512,850	£95,688,085	£21,003,215	£116,691,300
1860	£20,530,873	135,801,227	28,630,124	164,521,351
1870	368,237,128	199,586,822	44,493,755	244,134,738
1880	411,229,563	223,000,416	63,354,020	286,414,466
1885	370,267,563	213,044,500	58,359,194	271,403,694
1887	362,227,594	221,414,186	59,348,975	280,763,161
1890	420,885,867	363,531,585	64,349,091	327,880,676

The highest cash value of the imports was 1891, when they reached £435,691,279, and the highest value of the exports was 1890, when the total was £327,880,676, the latter but little in excess of the exports for 1872. Indeed, the vast increase indicated up to 1872 has since in a great measure been wanting, and total values have, with minor fluctuations, remained much upon the level of fifteen or twenty years back. But it is well worthy of remark that these are values only, and in no wise show the volume of merchandise moved. Now there have latterly been compiled many statistics to show that the prices of commodities have largely fallen since 1872, when measured by a gold

standard; and the tabular statistics supplied by Mr. R. H. Inglis Palgrave to the Royal Commission on the Depression in Trade in 1886 are conclusive on this point. It was therein shown that, as compared with 1865-69, prices in 1885 had fallen on the average 20 per cent, and as compared with 1872 the drop was as much as 30 per cent. From which it may be taken for granted—indeed it is capable of proof—that this country's foreign commerce is in bulk upwards of 30 per cent larger than it was in 1872. Indirectly the shipping tonnage entered and cleared with cargoes at the ports of the United Kingdom is an illustration of this expansion.

Ports of United Kingdom.	Entered.	Cleared.
	Tons.	Tons.
In 1872.....	17,905,940	19,248,352
In 1890.....	28,980,100	33,857,083

Thus it is right to assume that notwithstanding values are, as already stated, not higher than those of 1872, owing to an exceptional depreciation in prices, the actual commercial intercourse of the United Kingdom has largely increased.

In 1890, 41 per cent of the imports consisted of food and drink, 30 per cent of raw materials (of which 21 per cent was for textile manufacture), 15 per cent of manufactured goods, 6 per cent of metals and minerals, 2 per cent of chemicals and dyeing materials, and $1\frac{1}{2}$ per cent of oils, leaving $3\frac{1}{2}$ per cent to be accounted for by a number of miscellaneous substances imported, including tobacco. In the same year, of the United Kingdom exports as much as 43 per cent consisted of textiles, including yarns, 23 per cent of metals and machinery, 7 per cent of coal, $4\frac{1}{2}$ per cent of apparel, $4\frac{1}{2}$ per cent of food and drink, 3 per cent of chemicals, etc., $1\frac{1}{2}$ per cent of earthenware, china, and glass, 1 per cent of paper, 1 per cent of leather, and nearly 1 per cent of arms, ammunition, etc., leaving $10\frac{1}{2}$ per cent made up of miscellaneous manufactures. These are the returns of merchandise imported and exported in 1890, but the precious metals are not included. In the same year the imports of gold reached £23,568,049, and the exports £14,306,688, while the imports of silver were £10,385,659, and the exports £10,890,384. Combined with the former the following contrast is presented:—

United Kingdom, 1890.	Imports.	Exports.
Merchandise	£420,885,695	£327,880,676
Precious metals	33,953,708	25,197,072
	£454,839,403	£353,077,748
Excess of imports	101,761,655
		£454,839,403

This excess of imports is a very striking feature, and it is constant. In 1887 the excess was over £82,000,000; in 1885, £100,000,000; in

1880, £121,000,000; in 1870, £69,000,000. How can this constant influx, averaging over £90,000,000 annually since 1880, be accounted for? The figures furnished officially are admittedly defective on some points. The imports of precious stones are to a large extent wanting; the exports of ships, largely manufactured for and sold to foreigners, are wholly absent, and it is probable that if we added £5,000,000 on each side for missing items, we should be within the mark. But this does not help us to an answer to the question—How is the discrepancy between our imports and exports to be accounted for? In the first place, these imports are valued *plus* the charges for shipment to our ports, while the exports are returned *minus* those charges. Let us take 9 per cent as this addition to the exports (the reason of this percentage will appear later) as representing the earnings of British shipping engaged in this commerce; and add another 4 per cent for the earnings of British shipping carrying goods wholly for foreign countries or our colonies, and a total of some £47,000,000 results, which may fairly be set towards filling up this discrepancy. There still remains much to be accounted for. The interest remitted home for investments abroad supplies in great measure the solution. An estimate in the *Banker's Magazine* of 1880 of the amount of interest accruing annually upon British investments abroad, reached a total of £70,000,000 sterling. It is probable that this annual payment to Great Britain upon her external investments has since been increased, for though some foreign holdings may be smaller, colonial are certainly larger. The following rough balance-sheet may, therefore, be made respecting the commercial relations of the United Kingdom in 1890:—

LIABILITIES.	
Imports (as stated)	£455,000,000
(not stated)	5,000,000
Difference may, between the foregoing amount and that stated <i>per contra</i> , possibly be an increase in foreign investments.....	20,000,000
	<u>£480,000,000</u>
ASSETS.	
Exports (as stated)	£353,000,000
(not stated)	5,000,000
Earnings of British shipping	47,000,000
Interest on foreign investments	75,000,000
	<u>£480,000,000</u>

This is to be understood only as a rough approximation; it shows, however, that but for a further investment of capital abroad the country would have had the call of a still larger volume of imports.

The commerce of the British Empire may thus be stated, the figures including the precious metals, which in some colonies may to a large extent be ranked as merchandise.

	Imports. 1889-90.	Exports. 1889-90.
United Kingdom (1890)	£454,839,403	£353,077,748
Asiatic Possessions	104,368,172	112,991,945
Australasian "	68,014,098	65,041,552
African "	19,053,794	16,192,503
N. American "	26,366,209	21,150,730
S. American "	1,954,300	2,277,657
W. Indian "	7,436,771	7,023,763
European "	3,000,000
	<u>£685,032,747</u>	<u>£577,755,898</u>

If to this total be added the return of the remaining countries of the world, we obtain the following grand total:—

	Imports.	Exports.
British Empire	£685,032,747	£577,755,898
Europe	831,579,237	748,405,632
Russia and Turkey ...	92,507,579	92,872,479
Asia	47,344,250	48,182,070
America	213,517,042	233,268,360
Africa	14,182,414	16,017,537
World's Commerce	<u>£1,884,163,269</u>	<u>£1,716,501,976</u>

These figures are the latest returns available, though not all for the same year, and it will be seen that the exports grew to the extent of £167,661,293 in value by the time they became imports. This difference was equal to over 9 per cent on the exports, or to $4\frac{1}{2}$ per cent upon the combined total of imports and exports. In this way we arrive at some notion of the earnings and profitableness of commerce, and the worth and value of the world's shipping industry. Thus the world invariably appears to import more than it exports, and it is far from indicating any loss of purchasing power that there should be this discrepancy between imports and exports. Taking the population concerned as 1,250,000,000, this trade represents imports per head to the extent of £1 : 10s., and exports to the extent of £1 : 7 : 6 per annum. These averages, however, are reduced by the vast populations of Asiatic countries like China, where the imports are but little over 1s. per head and the exports under 1s. In Europe (apart from Russia and Turkey, which are partly Asiatic) the imports average about £4 per head, and the exports about £3 : 10s.; and in America (North and South combined) both imports and exports are over £2 per head. Australia is the largest import and export centre of the British Empire, in proportion to the number of inhabitants, the exports from that Continent to Great Britain averaging some £16 per head of the present population.

[The theory of excess of imports is well stated by Mr. Giffen in *Essays on Finance*. There is a full enumeration of the exports other than commodities, "invisible exports," by which imports are balanced in Bastable's *International Trade*; the heads of British commerce are given by Sir Rawson Rawson. His statement of the growth of tonnage and the conclusions built on it are striking (see also Goschen, *Foreign Exchanges*). For further details

see the Statistical Abstract and the Parliamentary papers relating to trade and commerce, *passim*.]

COMMERCE, BRITISH (HISTORY OF). The earliest trade of the British Isles consisted in the exchange of tin with the Gauls, and perhaps also with Phœnician traders.

Under Roman rule the agricultural and mineral resources of Britain were more fully developed. Corn was exported in large quantities. Tin, copper, lead, and iron were extracted, but there is little evidence that these articles were exported. London, as a centre of commerce, dates at least from Roman times (Tac. *Ann.* xiv. 33). It was certainly the principal port for trading with Gaul.

The English conquest which swept away the remains of the system established by Roman administrators, broke off active commercial relations with the continent; even the materials for any notice of commerce during the early Anglo-Saxon period are wanting. Towards the end of the 8th century traces of a revival appear—due to the influence of the Christian Church. The letter of protection for English pilgrims given to Offa of Mercia by Charlemagne (796), which refers to trade carried on by them, has even been called “the first English commercial treaty.” There is no evidence as to the commodities exported, but it may be inferred that raw wool had now become a leading article of trade to the Netherlands. Commerce was mainly in the hands of foreigners. The settlement of German merchants, which afterwards became the London HANSE (see ADVENTURERS, MERCHANT), existed *temp.* Ethelred II. (979-1016), and some aliens were probably resident before that reign. The often-quoted law of Athelstane (925-40), that a merchant who had made three sea-voyages should be of right a thane, is a proof of the small number as well as of the importance of such native traders. There is evidence that Bristol was the seat of a considerable trade in slaves with the Danish settlements in Ireland. The constant intercourse between England and Normandy also restored in some degree the older trade with northern France.

The “Colloquies” of Ælfric (11th century) tell us what the commodities imported were. A merchant being asked what he brings, replies, “skins, silks, costly gems and gold, various garments, pigments, wine, oil, ivory, orichalcum (brass), copper, tin, silver, glass, and such like,” hence it appears that articles of luxury were the principal imports. During the whole Old English period commerce was little developed (see CITY, MEDIEVAL). The so-called Anglo-Saxon “laws” bear the impress of this state of things. Beyond a few trite rules no commercial policy is discernible. The customs of a town regulate trade in it. There is no general commercial law. Any settled and definite policy as “mercantilism” or “protec-

tion” is not to be expected. At most, the rules bearing on the subject reflect the economic prejudices current among the classes who had the framing of law and usage in their hands.

The commercial position of England in the 12th century is better known. The communication with Normandy increased by the Conquest (1066). In the middle of the century mention is made of the import of silver in exchange for meat, fish, cattle, and wool, all being sent to the manufacturing districts of the low countries. The vigorous rule of Henry II. (1154-1189) assisted the revival of trade. His possession of Guienne gave new opportunities for traffic in import of wine and salt thence. Rouen was particularly favoured, being granted a monopoly of trade with Ireland, and freedom of commerce in London. The foundations of the future prosperity of many English towns were now laid. London was the seat of trade in such Eastern luxuries as were then becoming known through the influence of the Crusades (see CRUSADES, ECONOMIC EFFECT OF). Bristol and Chester had whatever Irish trade existed, and both these towns imported French wines. Hull was one of the ports whence wool went abroad, and the trade with Norway was carried on through Grimsby. Exeter exported the tin of Cornwall, obtaining wine and salt in return. A further proof of the growth of the English towns is found in the establishment, in most of them, of Merchant Guilds (see GUILDS). Corn was sometimes exported, but not without a royal licence (as in 1181, see CORN LAWS). A particular import—wool used for dyeing—seems to show that a native woollen manufacture existed, though all finer cloth came from Flanders.

The development of commerce from the reign of Henry III. (1216) can be traced by the attempts at legislation scattered through the early parts of the statute-book. The increased number of foreign merchants in England is a good indication of larger trade relations. The provisions of the great Charter, securing them liberty in time of peace and reciprocity of treatment in war, must have been called forth by the importance of their interests. Many cases of special privileges occur; as those granted to Venetian merchants and to German cities; first, to Cologne, the principal town of western Germany, later to Lübeck, chief city of the eastern Hanse. French cities (*e.g.* Amiens, 1237) also obtained special favours, mainly consisting in relaxation of restraints on trade imposed by customs and ordinances of English towns. All legislation was not so generous in character. The export of wool and import of cloth were prohibited 1261; “prohibitions repeated 1271.” In 1275 foreigners were ordered to sell their goods and depart within forty days, probably to prevent FORESTALLING (*q.v.*) Much indeed of mediæval legislation was in the

interest of the consumer rather than, as in later times, of the producer.

Besides the general effect on commerce produced by the policy and constitutional legislation of Edward I., he dealt in some cases directly with matters affecting trade. The Statute of Merchants (1283) gave greater security to foreign as well as native traders for recovery of debts, while the *Charta Mercatoria* (1303),—which by its enumeration of the various nationalities affected shows the extent of the body of foreign traders, confirmed and extended privileges which aliens had gradually obtained. Full security was given to all foreigners to come and go free from any personal duty; they were allowed to sell by wholesale to any native or alien, and to retail spices and mercery; any article might be exported, on paying the duty (except wine, for which a licence was required), to countries at peace with England. All restrictions on residence were removed, the export of wool on which duty had once been paid was legalised. It might also be moved from one part of the country to another (see BOARD OF TRADE). In this period there is a close connection between politics and commerce. Edward I. used the English supply of superior kinds of wool as a means of securing aid from the Flemings. According to the requirements of the moment its export was either forbidden, heavily taxed, or freely permitted. The first prohibition of the export of gold is found 1307; soon afterwards the *STAPLE* (*q.v.*) comes into notice. We cannot trace here the various changes of the system, but it tended directly to limit trade to the staple towns, and by enabling the course of every transaction to be more easily watched, made it possible to enforce the statutes which forbade foreigners to take their money out of the kingdom, or, in a milder form, required one half of it to be expended on native commodities.

The exports during the 13th and 14th centuries included wool, sent largely to Flanders, hides, tin, and fish. Coal was exported to France from Newcastle in the 14th century. Lead and iron were also at times exported, and in good seasons corn. The imports comprised iron from Spain, linen and fine cloth from Flanders, wine and salt from Gascony, silks, fruits, spices, and Greek wines brought by the Italian fleets, which, after 1317, regularly visited England. Furs, pitch, and timber came from the north of Europe through the traders of the Hanse towns; in times of scarcity corn was imported. The trade with Bordeaux was very active, and mainly carried on by English ships from London, Bristol, Dover, and Hull; they took out wool, herrings, lead, copper, and tin, and pilgrims as passengers; they returned laden with wine and wheat. In 1350, 141 ships carried 13,429 tuns of wine from Bordeaux to England.

The difficulty of getting precise amounts of the commodities traded in during the earlier periods has led historians to quote gladly the exports and imports as given in the custom accounts for 1354. The former comprise 31,651½ sacks and 3036 cwt. of wool, sheepskins, hides, 4774½ pieces of coarse cloth, and 8061½ pieces of worsted, representing a total value of £212,338:5s., of which nearly £82,000 went in duties. The imports were 1831 pieces of fine cloth, 397½ cwt. of wax, 1329½ tuns of wine, with linen, mercery, and grocery, the whole valued at £38,383:16:10, paying nearly £600 duty. These figures, however, though instructive as showing the amounts of commerce in certain articles, and illustrating the great predominance of export duties in early times, are yet very incomplete, *e.g.* there is no account of the large export of minerals. More detailed returns of the customs of the port of London during the 14th century show extraordinary fluctuations from year to year.

The mechanism of commercial transactions became much more refined during the period under consideration. Though the earliest dealers in money and exchange, the Jews, were expelled by Edward I. (1290), their place was speedily taken by Italians, who supplied the funds needed by the English kings for their French wars, and developed the employment of the *BILL OF EXCHANGE* (*q.v.*) Even in the absence of direct evidence it is probable that the stringent regulations as to export of money were evaded by the use of these instruments, supplemented by smuggling, which the small size of all the vessels employed in trade rendered very easy.

The trade of Ireland and Scotland, up to the end of the 14th century, was not important. Bristol received the raw produce of Ireland, principally corn and skins; there was also some direct trade with Bordeaux. Scottish wool was exported from Berwick, and the produce of the fisheries found its way both to England and the Continent.

At the opening of the 15th century British trade, in its mediæval form, had attained a high development, and was increasing in volume. Italian merchants were accorded full privileges by Henry IV. (1409), and even allowed to engage in the carrying trade contrary to the policy of the early Navigation Laws *e.g.* that of Richard II. (1381). The remarkable poem called a *Libel of English Policy* (1436) gives a full account of commodities exchanged between the countries of western Europe. Spanish goods—fruit, oil, soap, wax, and iron—reached England by way of Bruges. The Portuguese trade, a direct one, supplied similar wares with the addition of hides and salt. Of Italian traders the Genoese brought alum, spices, and gold to meet the balance due by them for the export of wool and

cloth from England. The Venetians supplied articles of luxury and were regarded with disfavour as leading the nation to engage in "unproductive" consumption. Wine and salt came from France, as formerly, but, in consequence of the continual wars, through Brittany, then practically independent. Trade with Flanders consisted in the exchange of raw materials for manufactures, but the growth of a feeling in favour of native industry is shown by the writer, who advocates a decided national policy, holding that England by her power over the supply of raw wool, and by her possession of Calais, which gave her command of the Channel, could compel Spain and the Netherlands to support her against France.

One of the best indications of the growth of commerce is the increasing number of wealthy native merchants. Though some are mentioned in the 13th century, and the names of De la Pole and Whittington were remarkable in the 14th, it is not till the 15th century that they become numerous,—at London, Cotton, Smith, and Bullayn; at Hull Taverner is noticed as trading with Italy and enjoying special freedom by royal licence; Thornton at Newcastle; the Jays, Sturmy, and notably the Cannynge at Bristol. William Cannynge the younger is said to have had one ship of 900 tons, and to have employed 800 men and ten ships with an aggregate tonnage of 2853 tons.

In the 15th century the society of ADVENTURERS, MERCHANT (*q.v.*) was first chartered (1406), though a greater antiquity is claimed for it. This body, trading with the Netherlands, Germany, and the Baltic coast, interfered with the previous monopoly of the Teutonic Hanse, which, however, still retained its privileges and factory at London. The fact that the Hanse trade supplied much needed and desired commodities—timber for ships and bows, iron, flax, and hemp, besides furs and Rhenish wine—undoubtedly led to this favour.

Another noteworthy feature is the increased number of COMMERCIAL TREATIES (*q.v.*) stipulating for reciprocal concessions to subjects of the contracting parties. Engagements of this kind were formed with Venice, the Hanse towns, Brittany, Castile, the Netherlands, and Denmark, the most remarkable being those of Utrecht with the Hanse in 1474, and the *Intercurus Magnus* (1496) which reopened the Netherlands trade after a suspension of two years.

The prejudice against foreign traders became very strong during the latter part of this century, and was still more intense in the next. English commerce had reached a turning-point; instead of simply supplying other countries with raw materials and taking in exchange finished articles, it was sought to preserve the home market for native produce and to place the carrying trade, so far as English imports and

exports were concerned, in the hands of English merchants. The woollen manufacture, which had always existed in a rude form and had been improved by Flemish immigrants in the 12th and 14th centuries, was now in a position to export the coarser kinds of cloth. The commercial history of the time is powerfully affected by a movement towards what would now be called "protection." Not to mention many minor acts dealing with special cases, there is the well-known statute of 1463 (3 Ed. IV. c. iv.) prohibiting, by enumeration, the import of almost all wrought goods, "that the English artificers may have employment"; and though the statute was limited to the king's reign, it was in fact re-enacted in that of Richard III., and regarded so late as the 18th century as "the wisest piece of commercial legislation." The ideas of aiding the defence of the kingdom, as in the laws of 1408 and 1483, requiring the import of bowstaves by the Venetian traders, and of securing an abundance of commodities specially needed for the welfare of the people, were still prominent in the minds of statesmen.

These tendencies of English commercial policy were supported by changes in the outside world. The fall of the Greek empire (1453) and the later conquest of Egypt (1517), involving the decline of Italian commerce, altered the balance of commercial as of political power. The consolidation of the French and Spanish monarchies changed the older lines of English trade with those countries, and the opening up of the New World of America and India had a still greater effect. The trade with the Mediterranean, formerly in the hands of the Italians, was now so important as to lead to the appointment of a consul at Pisa, 1485 (confirmed 1490), and after the discovery of the Cape passage to India (1497), English trade with Portugal rapidly increased. The Guinea traffic was opened 1530, the North Sea voyage to Russia discovered 1553. The Levant commerce commenced 1550, the first LEVANT or TURKEY COMPANY (*q.v.*) was chartered 1581. Ten years later the first voyage to India was made, and 1600 the foundation of the EAST INDIA COMPANIES (*q.v.*) was laid.

The movement of English commerce is shown by the average amounts of imports and exports during the reign of Henry VIII., which fairly represent the first half of the 16th century; as estimated by Schanz, they are as follows:—Imports, 10,060 tons of wine; 3028 cwt. wax, making with other imports a total real value of £402,092, but officially estimated at £284,360. Exports, 98,132 pieces of cloth; 5785 sacks of wool; 14,056 hides; 4387 pieces of worsted; 8931 cwt. of tin, with other exports giving a total estimated value of £427,830, officially stated at £293,287. Comparing these figures with the returns for 1354 given above, the growth of the woollen industry is evident—in-

stead of unwrought wool it is cloth that is exported. Even in Flemish markets English competition was beginning to be felt during the 15th century, while the wider field that the Italian and Levant trade offered proved a further encouragement. The development of English export trade was aided by the monetary revolution of the 16th century. For a thousand years there had been no considerable addition to the amount of money in circulation, which at times had been even reduced. England had kept up its stock of money by trade with Flanders and the Italian cities, but the discovery of the mines of Mexico and Peru led to a continuous flow of bullion through Spain to the commercial centres of the Low Countries, where the rapid rise in prices stimulated the already-growing import of English products, since there was no rise of prices in England till 1570. The revolt of the Netherlands gave a further opportunity to English traders. The capture of Antwerp (1585) was a severe blow to its trade, most of which passed to Amsterdam and London, which during the preceding eighty years had been gradually gaining at the expense of other English ports. A large body of Flemish weavers emigrated to the eastern counties and increased the power of that district to produce for export. The closing of the London settlement of the Hanse (decreed 1552, finally carried out 1598), removing as it did the last trace of a time when the commerce of England was conducted by foreigners, is a significant mark of the opening of a new period.

The 17th century is pre-eminently the period of the *MERCANTILE SYSTEM* (*q.v.*) The tendencies which had been shown under the Tudors, and even earlier, to advance native industries by excluding foreign rivalry, now took the direction of encouraging exports, more especially of initiating the commercial development of Holland by securing markets and the *CARRYING TRADE* (*q.v.*) The commerce of this period was mainly carried on by companies, either joint stock or regulated, possessing in some cases monopolies of commerce with particular countries—the East India Companies of eastern traffic, the Merchant Adventurers of the German trade. There was a steady advance in business transacted, as the following short table proves.

Year.	Imports.	Exports.	Total.
1613	£2,141,151	£2,487,435	£4,628,586
1622	2,619,815	2,320,436	4,939,251
1662	4,016,019	2,022,812	6,038,831
1669	4,196,189	2,063,274	6,259,463
1699	5,640,506	6,788,166	12,428,672
1703	4,526,579	6,644,103	11,170,682

Making due allowance for errors in the returns for each year, taken as they are from different sources, the general fact of increasing commercial relations is plain. In addition to older lines of traffic, all still open, there was the

East India trade at the commencement of the century, and later the important trade to the American "Plantations." At first the energy and superior resources of the Dutch enabled them to secure the greater part of the additional commerce of Europe. The pamphlet writers of the period are agreed on the point, and they are probably correct. Notwithstanding this relative inferiority, the commerce of England was certainly prospering. The woollen industry, now established as the leading manufacture, was increasing its export. Indian trade replaced the older commerce with Italy in supplying Eastern products, but the trade with the Mediterranean, now carried on by the Levant Company, retained much of its importance. Sugar, tobacco, and such rude products as timber and hides, were imported from the American colonies in large quantities. In spite of national jealousy and wars, the direct trade with Holland was large; English goods being stored at Amsterdam to be reshipped in the cheaper Dutch vessels. The Navigation Laws (see *NAVIGATION ACTS*), sought to destroy the advantage of these rivals, and are generally held to have so far succeeded. A further instance of the same spirit is found in the complete prohibition of French goods (1678); and, though the measure expired at the death of Charles II., it was practically re-enacted after the Revolution. In other respects the policy of protection was developed, the export duty on wool replaced by a prohibition, and various foreign products, which might compete with English goods were either excluded or heavily taxed. Trade with Ireland and the colonies was subjected to restrictions with the double object of securing a market for home manufactures and a cheap supply of raw materials for native workers. In another direction, however, commerce was freed from restraint. The privileges of the companies were closely questioned and the monopoly of the Merchant Adventurers was removed. The old "Statutes of Employment," prescribing the expenditure of money within the country, became obsolete, and the export of bullion was legalised (1663), a reform in which the advocates of the East India Company took a prominent part, since this trade was carried on by the export of silver to the East, where it was specially prized.

By the end of the century the exports to Holland had probably reached their highest point. In 1703 they amounted to £2,417,890 (*i.e.* over 36 per cent of the total), more than half (£1,339,526) being woollen goods. Trade with France was only possible by means of smuggling; the Methuen treaty with Portugal (1703) being expressly designed to give the wines of that country an advantage over competitors, of which the chief was France. The attempt to negotiate an Anglo-French commercial treaty (1714) was a failure, and the privileges given to England by the treaty of

Utrecht (1713) caused a development of the South Sea trade, ending in the terrible crisis of 1720-21. During the first half of the 18th century the most noteworthy feature of commerce was the growth of colonial trade. In 1704 the combined imports and exports in the "colony" trade were less than £1,300,000, or about one-ninth of the whole. Between 1760 and 1770 the colonial trade was one-third of a trade which had doubled in amount; in the export trade the increased proportion was still greater.

Among new articles of export may be noticed hardware from Birmingham and Sheffield, and cotton: the latter, though steadily growing, only amounted in value to about £200,000 in 1764, while the export of woollen goods was about £4,000,000.

The period 1750-70 fitly covers the commencement of the economic movement which has been happily called the INDUSTRIAL REVOLUTION (*q.v.*). A series of inventions altered the whole method of production, and the improvement in transport made exchange easier. As a consequence foreign trade, in spite of the political hindrances arising from protracted war, increased at a greater speed. The official values of imports and exports are not too inaccurate to bring this out clearly.

Imports and Exports at intervals of ten years 1770-1810.

Year.	Imports.	Exports.	Total.
1770	£11,002,000	£12,142,000	£23,144,000
1780	9,956,000	11,363,000	21,319,000
1790	16,308,000	17,636,000	34,004,000
1800	28,258,000	34,382,000	62,640,000
1810	39,302,000	48,439,000	87,741,000

The cotton industry shows the largest increase. In 1790 the value exported was £1,662,369; 1800 it reached £5,406,501; 1810, £18,951,994. The woollen export advanced from about £6,000,000 in 1800 to over £9,000,000 in 1815. There was also an increase in exports of hardware, earthenware, and silks.

During this remarkable development there was no relaxation of the Protective System. An exception must, however, be made for the early administration of the second Pitt (1784-92), when the customs laws were consolidated and the Eden treaty negotiated with France (*see* COMMERCIAL TREATIES). The break-down of the colonial system by the establishment of the independence of the United States did not reduce the American demand for English goods. On the contrary the exports thither increased from about £2,000,000 in 1772 to £3,500,000 in 1793 and £7,000,000 in 1798.

The peace of 1815 may be regarded as closing the period of English commerce which opened with the 17th century; since then the modern system of foreign trade has arisen (*see* COMMERCE).

The great commercial development of England has naturally led to the formation of theories as to the causes which have produced it. The principal are: (1) The mercantile theory, predominant in the writers of the 17th and first half of the 18th centuries, which explains the growth of English commerce by reference to the wise regulations and restrictions imposed by the state. (2) The view of Adam Smith and the English economists which ascribes the supremacy of England to its comparative freedom from restraints. (3) The doctrine of List who regards the present greatness of English industry and commerce as largely due to the advantages given by the earlier system of regulation and restraint. The influence of this theory may be traced in most recent works on economic history.

[Anderson, *Historical and Chronological Deduction of the Origin of Commerce*, 2 vols. fol., London, 1764.—Macpherson, *Annals of Commerce*, 4 vols. 4to, London, 1805. Based on Anderson for the period 1492-1760; the earlier part and the conclusion to 1800 by Macpherson solely.—G. L. Craik, *The History of British Commerce*, 3 vols. 12mo, London, 1844. Von Ochenkowski, *Englands Wirthschaftliche Entwicklung im Ausgange des Mittelalters*, pp. 168-253, 8vo, Jena, 1879, and W. J. Ashley, *English Economic History and Theory*, vol. i. pp. 102 seq. are useful.—G. Schanz, *Englische Handelspolitik*, 2 vols. 8vo, Leipzig, 1881, is a thorough study of the later mediæval period of English commerce and specially of the earlier Tudors.—J. E. T. Rogers, *History of Agriculture and Prices*, 6 vols. 8vo, Oxford, 1866-88, devotes special chapters to foreign trade (vol. i. ch. viii., vol. iv. ch. iv., vol. v. ch. v.)—Leone Levi, *History of British Commerce*, 1763-1873, 2d ed. 1880, has collected evidence on the growth of commerce in the 18th century.—Hubert Hall, *A History of the Custom Revenue of England*, 2 vols. 8vo, 1885, illustrates the course and methods of the mediæval trade of England.—H. de B. Gibbins, *History of Commerce in Europe*, cr. 8vo, London, 1891, bk. ii. ch. vii., bk. iii. chs. iii. and vi., and *Industrial History of England*, cr. 8vo, London, 1890, period iv. ch. ii., gives a good brief account of the growth of foreign trade. For legislation, charters, and diplomatic documents, the sources are: *The Statutes of the Realm*, 9 vols. folio, London, 1810-22, and Rymer, *Fœdera*, 17 vols. fol. London, 1704-1717.

Among the innumerable pamphlets on the different aspects of English commerce, the following give a view of its state at different times.—Sir W. Raleigh, *Observations touching Trade and Commerce with the Hollenders*, Works, vol. ii. London, 1751.—J. R., *The Trade's Increase*, 1615.—L. Roberts, *The Merchant's Map of Commerce*, 1638.—Sir J. Child, *A New Discourse of Trade*, 2d ed. 1690.—Davenant, *Discourses on the Revenues*

and the Trade of England, part ii. Works, vol. i. ed. 1771.—De Foe, *A Plan of the English Commerce*, 1728.] C. F. B.

COMMERCIAL INSTRUMENT. An instrument embodying a contract the benefit of which passes to every owner of the instrument. Where such an instrument is by custom transferable by delivery, with or without indorsement, and is also capable of being sued upon by the person holding it for the time being, there it is entitled to the name of a negotiable instrument and the property in it passes to a *bona fide* transferee for value, notwithstanding any defect in the title of the transferor. Bills of exchange, cheques, and promissory notes, are generally negotiable, but if they are payable to order an endorsement is required as well as delivery, if they are payable to bearer mere delivery is sufficient. A *bona fide* owner for value can claim payment of such an instrument if the chain of indorsements is complete, though one of the indorsers was not entitled to negotiate. A forged indorsement interrupts the chain, and a banker paying a bill having a forged indorsement cannot, as a general rule, debit the acceptor or the drawer with the amount of the bill. It is, however, provided, by way of exception to the rule just stated, that, where a cheque, payable to order, has been paid in good faith and in the ordinary course of business, the banker is deemed to have paid it in due course, notwithstanding any forgery in the indorsement (Bill of Exchange Act, § 60). A bill of exchange, promissory note, or cheque is not negotiable if it contains words indicating an intention that it should not be transferable (*Ibid.* § 8, sub-§ 1), and it ceases to be negotiable if its further negotiation is prohibited by a restrictive indorsement (*Ibid.* §§ 37 and 36). Over-due bills are not negotiable (*Ibid.* § 36, sub-§ 2). If a *cheque* is crossed with the words "not negotiable" it ceases to be a negotiable instrument, but it remains transferable. A person taking such a cheque, though payable to bearer, cannot claim payment if any of the holders through whose hands it has passed took it without a sufficient title.

A debenture, though expressed to be payable to bearer, is not necessarily a negotiable instrument (Crouch v. Crédit Foncier, Law Reports, 8 Queen's Bench, 374), but bonds or debentures may be made negotiable by statute—for instance, a statute of George III. made East India Bonds negotiable like promissory notes—and as promissory notes can now be issued under seal, debentures must be considered negotiable if they have otherwise the characteristics of promissory notes.

Foreign government bonds payable to bearer are generally considered negotiable by the law of the country in which they are issued, and are treated as such by the custom of bankers,

brokers, and dealers; if this is the case negotiability is also recognised in English courts (Gorgier v. Mieville, 3 Barnewall, and Cresswell 45; Goodwin v. Roberts, 1 Appeal Cases, 476). The same may be said with regard to share-certificates issued to bearer and other similar securities, but where share-certificates are not issued to bearer they will, as a general rule, not be negotiable; thus American railway shares are generally transferred by an indorsement appointing the indorsee attorney to effect the transfer in the company's books. It has become the custom for registered shareholders of such shares who wish to sell them to indorse the same in blank, and, according to the custom of the London stock exchange, shares thus indorsed in blank pass from hand to hand, until a buyer wishes to become registered as owner of the shares. Shares indorsed in blank in this manner are not negotiable, and a *bona fide* purchaser for value taking them from a thief acquires no title (Williams v. Colonial Bank, Law Reports, 38 Chancery Division, 388, affirmed by House of Lords 15 Appeal Cases, 267).

Documents of title relating to goods such as bills of lading and dock warrants are commercial instruments, without being negotiable in the strict sense; if a document of this nature is stolen, a *bona fide* holder for value taking from the thief acquires no right to the goods; he is, however, protected against vendor's lien and stoppage *in transitu*. The Factors' Act, 1889, provides that if a mercantile agent is, with the consent of the owner, in possession of documents of title to goods, any sale or pledge of the goods made by him is valid, unless the person taking under the sale or pledge had notice that it was unauthorised; in the absence of evidence to the contrary the consent is to be presumed. No such simple rule exists in the case of negotiable instruments. Bankers frequently make advances to customers on the security of such instruments, knowing that they may not be the borrower's property, but assuming that he has authority to pledge them. Where a money dealer obtained such an advance, the House of Lords held that the banker ought to have made special inquiries as to the extent of the authority (Earl Sheffield v. London Joint Stock Bank, Law Reports, 13 Appeal Cases, 333), but a similar decision of the Court of Appeal in the case of a stockbroker (Law Reports [91] 1 Chancery, 270) was overruled by the House of Lords (*Times* newspaper, 5th April 1892). The question depends on the particular facts of each case. E. S.

COMMERCIAL LAW. The body of legal rules that fall under the phrase "commercial law" may be divided into four classes. (1) International rules that govern the commercial intercourse of states. A very considerable portion of international law is concerned with

commerce, e.g. the rights of aliens, the position of consuls, freedom of navigation, carriage of contraband of war, breaking blockades, and the seizure of private property by belligerents. (2) Municipal laws of a political nature affecting the commerce of a state, such as laws imposing restraints on or encouraging foreign trade, laws relating to conveniences for navigation, laws regulating carriage by sea or land, laws encouraging particular trades, and laws preventing monopolies. (3) Municipal laws relating to the private interests of trade such as the law of contracts generally, and of special mercantile contracts in particular, including the law relating to the instruments of commerce. (4) The remedies to be pursued for injuries to commercial rights.

No attempt has as yet been made by the state in England to separate commercial law from the general body of the law, and only one text writer has endeavoured to do so on any adequate scale (see *Treatise on the Laws of Commerce and Manufactures and the Contracts relating thereto*, by J. Chitty, London, 1820). Several continental states, on the other hand, (e.g. France), have also a special commercial code administered usually by special commercial tribunals.¹

[The sources of commercial law may be classified as follows:—

a. Roman law, which furnished to the early English judges many rules which they applied to personal property.

b. The maritime codes of the commercial communities of Europe. The most important of these codes were the Consolato del Mare, the Ordinance of Wisby, the laws of Oleron, and the Ordinance of Louis XIV. See Pardessus, *Collections des lois maritimes antérieures au xviie. siècle*, Paris, 1826-1845. — Warnkönig, *Flandrische staats- und Rechtsgeschichte*, vol. 1.—*Capitula et ordinationes maritimæ civitatis Amalfitanæ*, Vienna, 1844.

c. The customs of merchants which came to be enforced if implied in contracts between merchants.

d. Statutory enactments. The great charter protected foreign traders; bankruptcy laws were passed under Elizabeth; monopolies were prohibited and the law relating thereto was settled in the time of James I.

e. The decisions of the courts. To Lord Chief Justices Holt and Mansfield, and to Lord Stowell is mainly due the development of the principles of commercial law.

Treatises relating to early commercial law: *Constitutio vel Lex Mercatoria*, by Gerard Malynes, London, 1622.—*Lex Mercatoria*, by G. Jacobs, London, 1718.—*Lex Mercatoria Rediviva*, by W. Baerwae, London, 1751.

Modern treatises: Smith's *Mercantile Law*,

¹ The commercial code in France has been considered to have exercised a great influence on traders by compelling attention to the mode in which they are conducting their business. Recent modifications may endanger this. See CODE NAPOLÉON.

London, 1890.—O. Tudor, *Leading Cases on Mercantile and Maritime Law*, London, 1884.]

COMMERCIAL ROUTES, HISTORY OF.

A. *Ancient History*.—Ancient commerce is remarkable for concentration; it affected a comparatively small portion of the earth's surface. The earliest peoples who rose to prominence and prosperity, the Chinese, the Egyptians, and the Aryan inhabitants of India, were mainly occupied in agriculture and domestic manufactures. None of them possessed the enterprising spirit which leads to external trade. The Chinese especially displayed that aversion to intercourse with foreigners which has characterised them to the present day. What trade existed in early days was conducted overland. The Arabs with their camels are the earliest known merchants. Their caravans conveyed the most valued commodities between Egypt and the populous districts of Central Asia and Hindostan.

The Phœnicians, the advanced outpost of the Semitic race on the Mediterranean, whose forests gave a plentiful supply of timber for the construction of ships, made the first attempt to conduct commercial enterprise by sea. Under the successive headships of Sidon and Tyre, the Phœnicians undertook the trade between east and west. Their colonies, originally commercial factories for the collection of goods, gradually spread over all the coasts of the Mediterranean, while Cyprus, Malta, and Sardinia furnished them with convenient harbours in the middle of that sea. For more than four centuries they monopolised the maritime commerce of the world. They collected and exchanged gold and precious stones from Asia, corn and linen from Egypt, frankincense and other spices from Arabia, wines from Italy and Greece, and the slaves of Africa. Gradually bolder traders overstepped the limits of the Mediterranean. Instead of merely receiving eastern goods from Arab caravans, they crossed the isthmus of Suez and voyaged from the Red Sea to the Persian Gulf and the coast of India. Westward they passed the Pillars of Hercules and founded a colony at Cadiz, whence they journeyed round the African coast as far as the Canaries, and sought the highly-valued tin from the Tin Islands, identified by some with the Scilly Isles.

Few geographical discoveries of first-rate importance were made in ancient times after the Phœnicians. Their most notable rivals were the Greeks; first Miletus and the Ionian cities of Asia Minor, and, after the Persian conquest, Athens and Corinth. But the Greeks did little more than compete with the Phœnicians on the old routes. Their colonies extended from the Ægean to Italy, Sicily, and the coasts of Africa and Gaul. Their greatest traveller, Pytheas, perhaps penetrated further westward than Phœnician merchants had been before. The
